The Nation.

NEW YORK, THURSDAY, JANUARY 1, 1891.

The Week.

THE bill of the Senate Finance Committee consists of two principal features: first, the addition of $12,000,000 to the silver purchases of the Government during the ensuing year, and, second, the issue of $200,000,000 of 2 per cent. bonds to take the place of an equal amount of 4 and 4½ per cents, which are to be redeemed or purchased. The latter measure is intended to afford the national banks an opportunity to obtain a kind of security for their circulating notes which will not slip out of their fingers as the present bonds do. The present fours command a premium of 21 per cent. This premium will be extinguished in sixteen and one-half years, *i. e.*, at the maturity of the bonds. One and one-third per cent. drops off each year. The temptation thus held out to the banks to surrender circulation, sell their bonds and save the premium, is altogether too strong. If they could get a new bond bearing so low a rate of interest that it would not command a premium in the market, but answering the same purposes as security for their circulation, the shrinkage of the bank-notes would cease. Under the arrangement proposed, it would be incumbent on the Government to pay the premium, *i. e.*, to buy up the outstanding 4s by putting $21 of its own money alongside each $100 received for the new 2s. This it could well afford to do since it would thus extinguish one-half of the interest yet to be paid. It would cancel a future obligation of $33 by a present payment of $21. The banks would simply exchange the old bonds for new ones. They would receive only 2 per cent. interest hereafter on their bond investment, but they could have the premium in place of it, and the interest on this premium, which would probably be as much as 5 per cent. per annum on the average. A bond of $1,000 running 16½ years would at maturity have yielded $642 in interest. The same bond at 2 per cent. would have produced only $321 interest, but it would, under the conditions mentioned, have produced $210 premium and interest on this sum at 5 per cent. for sixteen and one-half years, $173; the three items amounting to $704, or $62 more than the amount yielded by the 4 per cent. bond running the same length of time. Therefore the banks could well afford to make the exchange, and would undoubtedly do so if the opportunity were offered to them.

The original bill contained a provision that for all bank-notes hereafter retired silver bullion should be purchased and silver certificates issued, these to be additional to all other silver purchases provided for. The free-coinage Senators were not satisfied with this as a compromise, which would have been a surrender of the national-banking system and the substitution of Government note issues in place of it. The opponents of free coinage therefore dropped this part of the silver programme and reported the 2 per cent. bond clause in place of it. This action betokens a division in the Republican party in the Senate on the financial question as a whole, which is not likely to be healed. If the caucus meetings which preceded the Finance Committee's meeting could not achieve harmony, we may not look for harmony at all during the present session. A split in the party means no legislation whatever, for the leaders will make everything subservient to party success. Nothing that they can carry into the next Presidential campaign will be so bad as a declared breach in their own ranks. If there is such a breach, it will be stayed. The silver question and the bank question will be adjourned over to the next Congress. What may happen then cannot now be foreseen.

President Harrison deserves only praise for the appointment to the Supreme Bench which he made last week. Henry B. Brown's name is not one familiar to the country, but he is a man who has demonstrated his entire fitness for service in the highest Federal court by an excellent record in a subordinate court, as Judge of the United States District Court for Eastern Michigan during the past fifteen years, having previously been United States District Attorney. His appointment is, therefore, an application of the same principle which led to the selection of David J. Brewer for a seat on the same bench a year ago—viz., that the highest judicial honor should be conferred upon a man who has established his fitness by service on a subordinate bench, as Judge Brewer had done in the Supreme Court of Kansas and as United States Circuit judge. There have been eminent justices of the Supreme Court who took their seats without any such preliminary judicial service—notably the judge whose recent death caused the vacancy just filled, and who left a comparatively obscure law practice in Iowa to begin a distinguished career on the highest bench in the land. Chief-Justice Waite was another man thus elevated to great honor without previous judicial service who showed that a good judge might be secured in this way, but the principle of requiring proved capacity seems in every way more sensible. Certainly the country would have had no patience with an application of the contrary principle if the President had carried out his personal wish to give the vacant seat to the obscure lawyer who was his partner in Indianapolis.

Judge Brown's appointment gives Michigan its first representative in the Supreme Court. Another Western State which had never been represented might have had the place if Senator Spooner had been willing to accept, for the Milwaukee *Sentinel* states with authority that it was offered to him. There will now be one representative of New England—Gray of Massachusetts; two of the old "Middle States"—Blatchford of New York and Bradley of New Jersey; three of the great Western States—Fuller of Illinois, Brewer of Kansas, and Brown of Michigan; one of the Pacific Coast—Field of California; one of the South—Lamar of Mississippi; and one—Harlan of Kentucky—who is a sort of nondescript in the matter of locality, being in no proper sense of the term a representative of the South. Judge Brown comes to the bench at an excellent age, fifty-four, and it is an extraordinary coincidence that he should have been a classmate at Yale of President Harrison's other appointee, Judge Brewer, both having been graduated in 1856 It is not at all unlikely that Mr. Harrison may be called upon to make more appointments to this bench within the next two years.

We wonder how the Great Father felt when he received news of the Indian fight, with the loss of seven officers and men, and fifty wounded, and an indefinite slaughter of Indians. The cause of this Indian trouble is said, by the most competent observers, to be the change in the Indian agents which the Great Father has found it necessary to make for "the good of the party," and the operations in Indian food and clothing which the new agents have found it necessary to make for their own good. In other words, hunger has almost certainly been at the bottom of this outbreak. No men are so apt to see visions or dream dreams as hungry men. No man longs so much for a Messiah, especially if he is an untutored savage, as a man whose stomach is seldom effectually filled. The Great Father ought to be the Indian's Messiah, and the agents ought to be his trusty medicine-men; but no agent can be a good medicine-man if he has been a failure at home, and goes to live on the plains and take care of the savages in order to make a precarious livelihood, and lay up something for the rainy day on which a new Great Father will throw him again on the cold world of civilization. How a Great Father who is also a Presbyterian Elder, can countenance such a system, and say his family prayers with any peace of mind while he perpetuates it, passes our comprehension. For all this bloody work on the plains he is responsible. Neither party pressure nor the testimonials from leading citizens to the high qualities of thieving agents will cover him when he is called to account for all this bloodshed and misery. He will have to stand up and tell the whole story in the presence of a swarm of reporters.

A strong argument against the passage of the Force Bill is deduced by the St. Louis *Globe-Democrat*, a Republican opponent of the measure, from the recent election in South Carolina. It points out that this election "was fairly and justly conducted"; that, "for the first time in the history of any Southern State since the enfranchisement of the colored element, an opportunity was presented for free voting, and the votes were honestly counted"; that "the bulldozer was absent, and peace prevailed everywhere"; that, "in short, the situation was practically such as the friends of the Federal Election Bill hope to bring about throughout the South by the passage of that measure." What was the result? The colored vote was very light; in some places, where hundreds of negroes were registered, not a tenth part of them voted. Conceding that the suppression of negro suffrage in the past has probably caused the negroes as a class to relinquish much of their original tendency towards participation in political affairs, the *Globe-Democrat* insists that "such an explanation is not sufficient to cover the whole case." "It is evident," it adds, "that the colored man and brother is not imbued with a sense of the value of those rights and privileges which white men prize so highly. He does not care so much for the franchise as many people suppose. It is not to be doubted that much of the sympathy that we are in the habit of manifesting for him because of his political wrongs is wasted."

Mr. Henry C. Lea of Philadelphia has an article in the last *Atlantic Monthly* on "The Lesson of the Pennsylvania Election," in which, as far as regards that State, there is nothing to gainsay; but this passage puzzles us:

> "In the kaleidoscopic shiftings of American politics prophecy is proverbially dangerous, yet I cannot but think that the Republican party will eventually find itself stronger for its recent reverses. Containing, as I believe it does, the major portion of the intellect and culture of the land, it necessarily also contains a larger proportion of voters whose allegiance is lightly held, and whose support must be purchased by deserving. The grotesque spectacle afforded by the predominance in such a party of a man like Mr. Quay was in itself sufficient to repel from it enough voters to defeat it in the next Presidential canvass. From that danger it is to be hoped that Pennsylvania has delivered it. The rough good sense of the people elsewhere has taught its leaders a severe lesson; and such lessons, if rightly laid to heart, are the salvation of a party."

There are many objections to the law which enables the old Congress to sit and legislate after the election of the new one, but it has one merit: it enables the party in power, if it has been defeated at the polls, to show that it has profited by the lesson of the election. Has the Republican party given any sign that it has profited by the lesson of the last election? Not the smallest. Quay is not simply the Pennsylvania boss: he is Chairman of the National Republican Committee. Has the party taken any steps to oust him from this position which he disgraces? None whatever. Has he lost any of his influence with the majority in the Senate, or abated any of his activity there? None that is apparent. Is there any sign of repentance in the party over Speaker Reed's coarse tyranny? None whatever. Has Ingalls, twice elected President of the Senate, been made to make any amends for that gross insult to the conscience and intelligence of the party —the repudiation of the Ten Commandments and the Golden Rule? Not the least; in fact, he sticks to it bravely, and is seeking re-election on this devil's platform. We are omitting all reference to the tariff, out of regard for Mr. Lea's susceptibilities. We do not ask, Has the party shown any sign of regretting the McKinley Bill? We simply ask, Is it showing any desire to get rid of its thieves and liars? We agree with Mr. Lea in thinking that the party contains "the major portion of the intellect and culture of the land," but this makes it, in the absence of a sound morality, all the more dangerous to the country.

Postmaster-General Wanamaker has been caught again rather neatly by the Civil-Service Commissioners, owing to his practice of wandering about outside his reservation and trying to commit depredations on the reformers. In his last report he startled the Civil-Service Commission by the allegation that the examinations for the inspector force of the Railway Mail Service "ought to be made more difficult, so that the candidates for places will better stand the test of actual work." The Commissioners have taken this up, in a letter to the President, and say that, "notwithstanding repeated importunities, they have never received a hint from the Department officials that their examinations were not proper." They take it for granted, too, that the Postmaster-General would not complain of the character of the examinations unless he had some definite plan of improvement to suggest. On this point, in fact, they might have done execution on him out of his own report, for he says (p. 38-9) it is "dishonest to pretend to be friendly to the spirit of reform, which, as I understand, is nothing more nor less than a steady effort, under the laws of reason and human nature, to improve the public service, and not suggest means by which the regulation under which the instruments of reform operate may possibly be improved." This is gospel truth, but was evidently not thought of by Mr. Wanamaker when expressing his dissatisfaction with the work of the Commission.

The Commission caught him again and drove him back when he said that only a quarter or a third of the railway mail eligibles fill the requirements of the service, by showing that of 1,525 eligibles appointed since June 20, 1889, when the examinations for this branch began, only about 145, or about one-eleventh, have resigned or been removed, and it is reasonable to suppose that some of the resignations have been voluntary, so that 90 per cent. have remained in and proved satisfactory, there being no restriction on the power of dismissal. On this point again they might have effectually cornered the Postmaster-General out of his own report, for he says (p. 5) "that there is a spirit of loyalty and devotion throughout the ranks of postal employees, *notably in the Railway Mail Service*, which the best postal authorities declare to be in better shape than it ever was before." The Commission tackles him again on a third point, where he says, speaking of removals he had made in the Railway Mail Service of persons appointed under the Cleveland Administration, that "their room was more valuable than their bungling assistance." The Commission rightly calls attention to this as an indirect admission of the value of the competitive system of appointments. These removals took place between March 4 and May 1, 1889, and amounted to about one-half of those appointed under Mr. Cleveland through the old spoils system, of which, therefore, Mr. Wanamaker's charge is a strong condemnation.

The disappearance of the "Christmas Article" from the morning papers, which last week was practically complete, is, taken in connection with the abandonment of New Year's calls, a striking sign of the growth of the city in all directions. Only one journal has attempted it this year, but in an entirely new vein, showing that Christmas as a promoter of good-will "is not what it is cracked up to be," as Horace Greeley said of Westminster Abbey; with other reflections of a characteristically diabolical nature. The "Christmas Article," which we ourselves always read with genuine enjoyment, was really a reminiscence of Dickens. He introduced it into journalism some fifty years ago, and has supplied materials for it ever since. Each generation of young writers, as they came into action, brought to the notice of their elders, in Dickensian phraseology, the various suggestions of Christmas in the matter of forgiveness, brotherly kindness, and charity, and the peculiar unsuitability at this season of any indulgence in the passions of envy, hatred, and malice. It was all excellent in its way, but it began after a while to be rather wearisome to the judicious. Not all the preachers of good-will were up to the level of the occasion, and they too often degenerated into bathos, and began to excite a kind of mirth which was injurious to Christmas as a festive and happy season. So they have stopped supplying Christmas thoughts for the multitude; but we doubt much whether they would have done so but for the growth of the city into a huge metropolis, in which it is increasingly hard to produce effective sentimentality about anything, and in which everybody is more and more easily bored by any kind of repetition.

The effect of the Parnell-McCarthy row on

the Bering Sea question is involved in a good deal of obscurity. That it should have its influence is too plain for argument, although some little time must be allowed for our politicians to decide what they ought to do about it. If the Parnellites and the McCarthyites should be hotly engaged in Ireland for a long time, and if their sympathizers in this country should be very much absorbed by the struggle, they might lose control of the foreign policy of the United States. In such case Mr. Blaine would perhaps find the principle of arbitration not exactly *contra bonos mores*. Senator Frye is evidently of this way of thinking. The Portland *Press* quotes him as saying that the first thing to be done about Bering Sea is for the United States, "either alone or in conjunction with Great Britain," to find out whether the fur seal is diminishing in numbers or not. "If it is shown that the seals are disappearing, then the matter should be referred to a board of arbitration." If they are not disappearing, the poachers should be allowed to poach, and of course our own law, which forbids poaching by Americans, should be repealed. This is all very well. The question now is, whether the preoccupation of the Irish with their own internal affairs has made the way clear for such enlightened views.

Mr. Parnell has been expressing great displeasure with the priests for helping to defeat him at Kilkenny, but this is, in truth, a further confession on his part of extraordinary political ineptitude. Just as he ought to have foreseen the unwillingness of the English Liberals to act with him after the judgment in the divorce court, so also he ought to have foreseen the probability that the priests would work against him in Ireland. In fact, nearly everybody else who knew anything about Ireland foresaw that they would. It was one of the reasons which led most other observers to believe that Parnell would be defeated in Ireland. One of the most important elements in every Irish problem is the influence of the priests. The priests have influence not only because they are the spiritual directors of the masses in the south and west of Ireland, but because the agrarian question has made them almost the only educated or half-educated leaders the people can get hold of. They are, almost of necessity, in most parts of the country, the most available political orators and advisers the voters have. Even if Parnell had been a Catholic, he would, under the circumstances, have had no chance of their support, because there are no offences against which the Church sets its face in Ireland so relentlessly as offences against sexual morality. The spectacle of the Irish priests condoning an adultery while the English Nonconformists were condemning it, would have been a ridiculous one. That Parnell should not have foreseen all this when he was forming his plans a month ago, is one more sign that something has gone seriously wrong with his judgment. His denunciations of the priests now may relieve his pent-up feelings, but they must, on the morrow of defeat, make his situation worse than ever.

Gen. Booth's 'In Darkest England' has made considerable sensation in England, and has secured for the scheme it has proposed—the raising of $5,000,000, to be intrusted to Gen. Booth for a great work of social regeneration—a good deal of support from philanthropists, particularly clergymen. But it has also drawn forth an amount of criticism such as the Salvation Army has never before had to encounter, and which now seems likely to have serious consequences for the whole organization. It has come out that Gen. Booth did not write the book at all, that Commissioner Smith, his chief lieutenant, wrote it, and that the plan it proposed was in its main features Commissioner Smith's. To claim its authorship under these circumstances was an odd thing for the chief of a religious organization to do, particularly when he was asking the English public to intrust a million sterling to his discretion. But this is not all. The appeal and the comments it has called forth have let loose a great deal of hostility to "the Army," which has hitherto been for one reason or another suppressed. Some one sent £1,000 to Prof. Huxley, asking him to hand it over to Gen. Booth for use in his regeneration scheme, if he (Prof. Huxley) approved of it. Huxley announced publicly that he did not approve of it, on the general ground that large religious or semi-religious organizations, like the Roman monastic orders, held together by implicit obedience under one chief, were morally and politically injurious to the community. This fulmination brought him a shower of communications about the Salvation Army, which led him to return to the charge, accusing Gen. Booth of using the funds of the organization in such a way as to keep himself and his family in comparative luxury, while he paid his subordinate officers a mere pittance and treated them with great tyranny. He intimated, at the same time, that he had worse things than these about the funds in reserve, which would, if necessary, show the General's audacity in asking people to intrust a million sterling to his discretion. Prof. Huxley's attack was followed up by letters from the leaders and promoters of several societies which work among the poor in London, declaring that they had yet to light on a single case of permanent redemption or elevation of any victim of vice or poverty through the agency of the Salvation Army. The news of Commissioner Smith's resignation looks as if Huxley's assault had caused considerable perturbation of some kind inside the fort.

Cuba is demanding an unwonted amount of attention from the home Government these days. The question of representation in the Spanish Cortes is one which has long been a sore point with the Cubans. A law of 1878 put the Cuban representation at twenty-seven deputies, and authorized the Government to make a suitable division of the island into districts. This division has not yet been made. That is one grievance, and another lies in the fact that the abolition of slavery has added at least 300,000 to the free population, thus entitling Cuba to five additional deputies; but she has not had them. A similar state of things exists in Porto Rico also. But the Spanish Government has just issued a decree making the requisite enlargement of the colonial representation, and authorizing the Governor-Generals themselves to make the proper electoral divisions. In the matter of restricted navigation and commercial relations with the United States, the complaining Cubans are not likely to fare so well. Say the Cubans: "Our duty on flour is seven dollars the hundred kilos, while in Spain it is but $1.60; the result is, that American flour goes to Spain, and thence gets free entry into Cuba, making mockery of our tariff." The Ministry admits that this is done, but says that such flour bears only a small proportion to the total amount of flour exported from Spain, and, furthermore, that the Spanish duty is soon to be raised to the prohibitory point. That is the sort of answer the Cubans are going to get all around; their foreign navigation is to be put still more exclusively under the flag of Spain, and their wish for commercial reciprocity with this country will be met by higher tariffs, in defiant answer to McKinley.

Elections to the provincial legislatures took place in Spain on December 7, and the results fall in with the general Conservative trend; one estimate puts the supporters of the Administration elected at 354, against 162 for all divisions of the Opposition. The Conservative organs assert that there was never an election in Spain so free from governmental interference, pointing to the fact that in the province of Madrid, where, if anywhere, official influence could make itself unwarrantably weighty, the Government elected but two out of sixteen members, and confidently predicting an equally untrammelled choice of a Conservative majority in the next Cortes. The Liberal papers, on the contrary, after their first rejoicing over their unexpected success in Madrid, were loud in their declarations that grave abuses had been committed, and were definitely proposing to prosecute the Governors of five specified provinces for electoral frauds. Probably the truth lies somewhere between the two extremes. At any rate, the Opposition will approach the February general elections with scarcely concealed hopelessness. Castelar has recently issued a manifesto calling for an active union of all elements of the Opposition in the canvass, but as Sagasta is precluded from making terms with the avowed Republicans, the appeal can amount to little except to betray the weakness of the Opposition. One surprising feature of the elections was the low percentage of qualified voters going to the polls. Under the new suffrage law there were in Madrid, for example, 118,000 electors entitled to vote, but of these only 18,000 actually voted. Similar proportions were observable in the provinces. This, of course, takes away considerable significance from the result.

A WORD FOR OBSTRUCTIONISTS.

THE Anglo-Saxon world has been ringing during the past seven years with the complaints of parties in power over the obstruction offered to legislation by the parliamentary minorities. There has been a great deal of such obstruction, and it has led to very remarkable changes in the rules of English parliamentary procedure as well as in those of Congress. The American Senate, in fact, is to-day the only important legislative body in the world in which neither the majority nor the presiding officer has any power to restrict debate. Instead of prizing this distinction, however, preparations are being made by the majority in the Senate to get rid of it, and to adopt a rule giving the majority such complete control of the process of deliberation that it can put an end to it at any moment. The hostility to deliberation to which Speaker Reed gave such strong expression in the House, both in his rules and in his talk, for the benefit of the McKinley Bill, is now finding expression in the Senate for the benefit of the Force Bill, even through such men as Mr. Edmunds, whose partisan fervor is now only surpassed by that of Mr. George Hoar.

The case against the obstructionists on both sides of the water is a very plausible one. It is true, as Mr. Edmunds says, that the common parliamentary law has always been "that no man is to speak impertinently or beside the question, superfluously, or tediously." It is also true, as he remarks, that the Constitution of every parliamentary government must and does provide "that the majority of any legislative body has to do its business." But no action on these rules should ever be taken without consideration of the well-known fact that every man engaged in controversy is prone to believe that his adversary talks too much, and is prolix, impertinent, tedious, and superfluous. We have not yet happened to meet with or hear of a disputant who was not greatly flattered by the prompt surrender of his antagonist, and correspondingly provoked by his prolonged resistance. In nothing does human nature show itself more plainly than in argumentation. It is only very great souls who are not more or less irritated by inability to win a complete dialectical victory, although no victories are so hard to win. The old woman who signed "Scissors!" above water, as a sign of unconquerable adherence to her own opinion, is only a type of all that portion of mankind which tries to convince by argument.

All this is as true of deliberative bodies as of individuals. The power to close the mouth of an antagonist, on the ground that his talk is a mere waste of time, is just as likely to be abused by a parliamentary majority as by an individual. The conceit of one's own opinion is even stronger in a group of men than in any single man. A majority, therefore, although it may be the only possible judge of the proper length of debate, is far from being a fit judge of the proper limit of the minority's discourses. We do not suppose there is a Republican in the Senate to-day who has not considered every Democratic speech made against the Force Bill a mere waste of time. These very human weaknesses have to be borne in mind by every candid man in weighing a proposal to restrict debate in a legislative body. The majority, it is true, must rule, but in deciding how much the minority shall be allowed to talk, it is, in a manner, acting as judge in its own cause.

Another point worthy of attention is, that, by the general consent, we believe, of the public in the great democratic countries of the world—the United States, England, France, and the British colonies—the great legislative mischief of our time is not the difficulty which majorities find in legislating, but their disposition to legislate overmuch. Every one of these countries is complaining not of too little legislation, but of an excess. All Conservatives in England to-day are lamenting that the powers of the British Parliament are not restricted by a written constitution. We have not the smallest doubt that, if the parliamentary records of the last twenty years, in the countries we have named, were searched and collated, it would be found that each one of them had in that period profited in as great a degree by the failure of measures through obstruction in some shape, as it has done through the passage of measures, however useful or well conceived. In other words, parliamentary prevention has done far more for the world than parliamentary cure. The legislative fever of majorities is one of the great curses of the day.

Though last not least, it must be borne in mind that the parliamentary crises which have led to serious restrictions on debate, have been brought on, if not in every case, in nearly every case, by attempts at what is called "drastic" legislation—that is, by attempts to pass bills of a violent and unusual kind, about which the public is nearly equally divided, or which shock the moral sense of a large and respectable portion of it. Take, for instance, the occasion for these restrictions in England and in this country. The closure in its present stringent form was not due in the House of Commons to opposition to usual legislation of general utility. It was due to the determination of the majority to suspend the Constitution in a particular portion of the kingdom as a punishment for disorders caused by undenied grievances, before the grievances were redressed—a complete reversal of traditional English policy in dealing with popular discontent. It has appeared plainly, whenever any appeal was made to the voters on this subject, that they were nearly equally divided—that is, that the obstructive minority represented almost as large a proportion of the nation as the majority, and that the majority had no "mandate" on the subject so clear as to arm it with arbitrary power for its execution.

The same thing is true, *mutatis mutandis*, of Speaker Reed's rules, and of the closure which it is now proposed to introduce into the Senate. Reed's rules were concocted not to meet a popular demand, but to force through a measure of an extraordinary character, which had not been called for, and concerning which its promoters were wholly ignorant of the state of public opinion; so that, as the event has shown, the minority which resisted it represented far more truly the will of the people than the majority which pushed it *per fas aut nefas*. These observations apply with equal force to the bill on behalf of which it is now proposed to restrict debate in the Senate. It is essentially "drastic," extraordinary, violent, and even revolutionary in its character. It does not bear discussion. It has not been called for through any of the ordinary channels of public opinion. There is, in fact, much reason to believe that the bulk of the Republican party is opposed to it.

It is for measures of this sort that parliamentary bodies are gradually being deprived of their deliberative character, and converted into chambers in which arbitrary majorities hold "beds of justice" and order the registration of their decrees. There has been, so far as we know, nowhere any serious resistance to the ordinary legislation of plain utility, and in favor of which there is an undeniable preponderance of popular sentiment. The attempt to gag the minority in the Senate is made the more objectionable, and resistance a more solemn duty, by the fact that the majority has twice put in the chair a man who avows as his rule of action in politics a complete disregard both of the Ten Commandments and the Golden Rule. A majority which makes such a man its mouthpiece and the moderator of its debates, deserves no consideration as a deliberative body which circumstances do not make imperative. Obstruction of its action is "a fault not unallied to virtue," as a great orator once said, "and even capable of admiration."

STATE COPYRIGHT LEGISLATION.

MR. BRANDER MATTHEWS makes a fresh contribution to the voluminous literature of literary property by an interesting article on the "Evolution of Copyright," in the *Political Science Quarterly* for December. Starting with a quotation from James Russell Lowell to the effect that all property "is artificial, purely a creature of law, and, more than that, of local and municipal law," and another from Matthew Arnold, that "an author has no natural right to a property in his production"—opinions which we are to suppose Mr. Matthews shares, as he says nothing to the contrary—he proceeds to show how quickly, after the invention and spread of the art of printing, the author began to protest against any "disseisin" of the fruits of his labors and to attempt to obtain some legal (*i. e.*, State) intervention to prevent the wrong. There is little doubt that the advancement of the international-copyright idea, shown in the recent passage of a bill by the House, is very largely due to the education of public opinion in the right direction. But the victory is not yet ours, so there is room for more educating, and Mr. Matthews's article is timely and furnishes one useful method of teaching by setting before the reader certain facts of legislation at home and

abroad upon literary property, so that he may compare our position with that of other nations. In this matter we think there can be but one opinion after a perusal of Mr. Matthews's article. The United States does not occupy the proper place of a great and progressive country, and has entirely failed to keep pace with the evolution of the ethical question involved in copyright legislation.

Mr. Matthews sketches broadly the progress of legislation in behalf of the productions of authors, in England, continental Europe, and the United States, devoting a second chapter to the comparatively recent movement for international protection by means of treaty stipulations. The movement in this direction did not originate, however, as one might infer from his text, in France, but was started in Germany, in 1829, and the next move was made by Italy, some eleven years later. But from 1850 to 1870 France was indefatigable in her efforts to secure guarantees for the protection of the property of her authors abroad, and scarcely a year was allowed to elapse without adding the names of one or more countries to the list of those with which it had treaties, until this list included Great Britain, Belgium, Holland, Saxony, Prussia, Bavaria, Austria, Russia, Switzerland, Italy, Spain, and Portugal, besides thirty-two other smaller States. The example of France has been followed by almost every country in Europe, but the United States, in more than a hundred years of political existence, has failed to secure a single international treaty for the protection of her authors or artists abroad, and their valuable property has been, for more than a century, at the mercy of pirates.

In a paragraph relating to the United States, Mr. Matthews gives a chronology of the legislation upon copyright, and refers to what took place before the enactment of the first Federal statute of 1790. But his references are not entirely correct, and fail to do justice to the very interesting first chapter in the history of copyright in the United States. The proposal made by Congress to the original States was not that they should pass acts granting copyright for a term of fourteen years (in a resolution adopted May 2, 1783), but that the States should pass laws securing to authors and publishers and their assigns copyright for not less than fourteen years, and to authors, if surviving, for a second period of not less than fourteen years. This double term was copied directly from the British copyright statute then in force, the act of 1709. Twelve of the thirteen original States passed such acts. We cannot enlarge upon them here, but as we have never seen printed a correct list of these acts, we will briefly state the dates of enactment, and the term or terms of the protection granted in each case. Connecticut has the honor of heading the list; and we should not omit to mention that not only this State statute, but all the copyright legislation enacted within the United States between 1783 and 1831, was due to the individual efforts of Dr. Noah Webster. The Connecticut act was passed in the January session of the General Assembly of 1783, and granted copyright for two terms of fourteen years each, being a copy of the English statute, but amended to this extent, that while the British act allowed the second term of protection only to the author, if living, the Connecticut act extended the second term to the author's heirs or assigns, if he were not living. Massachusetts followed with an act passed March 17, 1783, the term fixed upon being twenty-one years from the date of the first publication of the work.

These two enactments, it should be noted, were passed before the date of the Congressional resolution referred to above. In prompt response to the recommendation of Congress, in the session of the Assembly of Maryland begun April 21, 1783, there was enacted a law granting security to authors for fourteen years, and, if living, for a second term of fourteen years. On May 27 of the same year, New Jersey passed an act with a double term exactly similar to that of the Connecticut act, a copy of which we know was before the committee appointed to draft the new law. New Hampshire was next in order of time, November 7, 1783; the term of the protection accorded by the act being twenty years. Although this act became inoperative upon the passage of the Federal statute of 1790, it was included in the various revisions of the New Hampshire laws up to 1830, but on December 23, 1842, it was formally repealed.

The General Assembly of Rhode Island was also prompt in acting upon the suggestion of Congress, passing, in the December session of 1783, an act which is a duplication of the Massachusetts law, with only such changes as were required by the change of location. Pennsylvania followed with an act passed March 15, 1784, with a fourteen-year period, followed by a second of like length for the benefit of the author, or his heirs or assigns. On March 28, 1784, South Carolina passed an act of considerable length granting to authors protection for their works for fourteen years, and for a second term of the same length, if then living, with a retroactive clause designed to protect for fourteen years, from January 1, 1784, books which already had been printed. Virginia was more than a year later in coming into line, the General Assembly passing no act until the session commencing October 17, 1785. The term of protection according to this law was twenty-one years from first publication, both for books already printed and for books to be printed. The General Assembly of North Carolina, in its session beginning November 19, 1785, passed an act granting authors' copyright for a single term of fourteen years. Georgia was more liberal, returning to the double term of fourteen years in an act passed February 3, 1786. New York was the last State to get into line, not passing any law until April 29, 1786, when an act was approved containing the usual double term of fourteen years. As regards Delaware, we find no trace of any enactment by that State.

THE GERMAN SCHOOL REFORM.

At a time when the proposed changes in the duration of the undergraduate course at Harvard have brought the old controversy between life and learning more forcibly than ever before the American public, a movement which for several years has been going on in Germany assumes an additional and practical interest. There seems to be little doubt that the position of the old-time Gymnasium, once the pride and glory of German humanism, has become wholly untenable; that, if it is to be saved from becoming a mere name and pretence, steps must be taken to reform it, and that these steps *will* be taken in the direction of reducing the amount of time given to studies which have no relation to the needs of actual life.

It is not too much to say that, with the single exception of the labor question, no problem is at present agitating the German people more deeply. An unprecedented high tide of educational literature is flooding the book market; the air is full of resolutions for and against the present curriculum passed by learned societies, teaching bodies, and legislative assemblies; and now even the young Emperor appears on the stump as a school-reformer. Among the evils of the system now in force which the advocates of reform have been most zealous in pointing out, three seem to be of paramount importance: (1.) The crowding of the Gymnasia by pupils attracted thither solely by the prospect of obtaining a certificate for a privileged position in the military service. (2.) The undue preponderance given to drill in the ancient languages. (3.) The absence of any rational method of furthering the development of a strong, harmonious, and healthy manhood.

With regard to the first point, it may be remembered that, under the existing laws, all persons who have completed half of the course of *Secunda*, the next to the highest class of a Gymnasium, are entitled to the privileges of the *Einjährig Freiwilligen* service, *i. e.*, they have to serve only one year in the army instead of three, on condition that they support themselves during that year. Leaving out of consideration the apparent inequality introduced into the military service by this provision, it is obvious that it also poisons the very heart of Gymnasium life. The young men who come to it with this aim in view have most of them no scholarly purpose whatever; they do not study for any of the professions, and a good many of them are a positive nuisance. And yet by their mere presence, if not by the weight of their number, they affect the whole tone of the school, lowering the standard of attainments, and forcing the teachers into mechanical and stereotyped methods of instruction.

About the necessity of reform, then, in this respect there is no dissension; the only doubt is about the method of reform—the more conservative hoping, by a deferment of the *Einjährig Freiwilligen* certificate to the end of the whole Gymnasium course, to frighten away the undesirable element, the

radicals condemning the *Einjährig Freiwilligen* privilege itself, and demanding the same amount of military service for everybody. Whatever the solution of this matter may be, it is clear that, through the elimination of this class of pupils, the Gymnasium will assume once more its old and true character as a preparatory school for the learned professions, and that then it will be possible to adapt the instruction to definite and well-circumscribed ends.

There is, of course, a much greater difference of opinion about the two other points: the weight to be given to classical studies, and their relation to the system of higher education as a whole. And yet it is apparent that the days of undisputed supremacy of classicism are numbered, and that the necessity of reconstructing the Gymnasium in conformity with the demands and ideals of modern life is becoming more and more recogn zed. Even so enthusiastic a champion of the existing order of things as Heinrich von Treitschke declares that the present method of stuffing the pupils with Greek and Latin grammar simply tends to destroy in the majority of them not only all respect for Greek and Roman life, but also the susceptibility for understanding the conditions and problems of our own time. So moderate and cautious a man as Prof. Eucken of Jena, himself one of the finest classical scholars in Germany, finds himself obliged to enter a vigorous protest against the dulling of the German youth through a system of abstruse book-learning and antiquarianism; and it seems that his own proposal to abolish altogether that stronghold of philological fanaticism, the final examination of the whole Gymnasium course, has called out a strong echo of approval from all over Germany. Herr von Gossler, the Prussian Minister of Public Instruction, has for years been insisting on the necessity of devoting a larger part of school life to the development of physical strength, and of all those manly faculties which have such a large share in building up character. And one of the most successful books of the year has been a pamphlet by the noted African explorer, Dr. Paul Güssfeldt, one of the intimates of Emperor William, which offers as a watchword for the future education of German youth, "Less knowledge and more culture." In short, the day has come when, as Prof. Paulsen predicted five years ago, the best intellect of the country demands that an attempt be made to fill up the gap now existing between the schools and nearly all the forms of professional, scientific, and commercial life.

It is under these conditions and in this state of public opinion that the Prussian Government has called a conference of forty-four distinguished professors, teachers, writers, officials, and business men, embracing such names as Helmholtz, Virchow, Zeller, Paulsen, Tobler, to deliberate on a reorganization of the foundations of higher instruction; and it is to this august assembly that the Emperor has unbosomed himself in a manner which leaves no doubt as to his sympathies and wishes. A curious spectacle it is, this dashing young officer talking to gray-bearded men of world-wide reputation about matters of gravest import in his high-handed cavalry fashion, and apparently without the slightest consciousness of his intellectual inferiority to most of his hearers. And yet, as a symptom of how completely the new ideas have taken possession of the younger generation in Germany, some of his words are well worth quoting. What could be better than this?—"It frequently happens in the Gymnasium that a young man writes a better Latin than a German composition; and for that he is praised. That fellow ought to be punished instead of being encouraged. We have to educate young Germans, not young Greeks or Romans; and German ought to be the centre of the whole instruction. Therefore I say, Away with Latin composition!" Or this?—"The roots of our present civilization lie in the age of the French Revolution; and I am firmly convinced that, if we teach our young men the transition from that period to the nineteenth century in a clear, objective manner, they will have a much better understanding of the questions of to-day than they now have." Or this?—"Men must not look at the world through spectacles, but with their own eyes; and above all they must see with their own eyes and enjoy what is nearest to them all, their fatherland."

It would be a mistake to expect of the present Conference a radical change of the constitution of the German Gymnasium. The Conference itself has only deliberative powers, and things will go slowly, even if the resolutions of this body should be as incisive as the Emperor evidently wants them to be. But so much is clear, that those who in this country advocate a shortening and simplifying of the college course are not alone in their contention.

THE CONFLICT IN THE IRISH PARTY.

LONDON, December 16, 1890.

EVENTS have passed so swiftly during the last four weeks that it is not easy to recall the successive phases through which opinion has passed, and to convey the exact impression which each incident in the always changing struggle made as it occurred upon those who watched the actors. No drama within the memory of any living politician has had so keen a personal interest; in none have the fortunes of a single man been followed with a more anxious sense of the far-reaching consequences which his failure or triumph may involve.

The result of the suit of O'Shea vs. O'Shea and Parnell in the Divorce Court did not surprise members of the House of Commons and such other persons as had been "inside politics" during the last seven or eight years. Some, indeed, of them had been led, by declarations emanating from Mr. Parnell himself, to believe that he had a complete defence to the charges made against him. O hers had been so impressed by his resourceful vigor as to expect that he would somehow buy off or otherwise get rid of his antagonist. The majority, however, had heard so much of Mrs. O'Shea and his relations with her in 1883 and the years following that they had little doubt about the facts, and were prepared for the verdict, though not for the humiliating and indeed degrading details which were brought out in the evidence. They were, of course, annoyed and disheartened by an event which the Tories immediately rejoiced over, as confirming their bad opinion of Mr. Parnell. But inasmuch as they were not astonished, they failed fully to realize the gravity of the position, and said to one another that it was for the Irish to pronounce judgment upon their own leader, and that Englishmen and Scotchmen had better stand aloof and avoid all semblance of interference.

This was the view of the Irish members themselves, who promptly met in Dublin and passed resolutions of confidence in Mr. Parnell. With characteristic impetuosity, some of them went so far as to protest their unabated devotion to him, and talked of rallying around him as though he had been a hero or a martyr. This was the first mistake, and it was a terrible one, which has created a swarm of subsequent troubles. The first of these was the effect on the rank and file of the English Liberal party. Having been accustomed to admire Mr. Parnell as a patriot, having recently poured out a flood of sympathy upon him under the slanders of the *Times* and the forge ies of Pigott, they were dismayed and disgusted by the Divorce Court revelations, and expected either his abdication or his prompt deposition by the Irish party. To find him belauded was more than they could stand, and the cry soon went up in every part of England and Scotland that though their views about the intrinsic merits of home rule were unchanged, they could not work or vote for home rule while Mr. Parnell was the living embodiment of the principle. This outburst of popular opinion, in whose expression the Nonconformist ministers were conspicuous, was quite spontaneous. Not only was it unprompted by the leaders of the party—it actually surprised them by its vehemence and its unanimity. It so happened that a sort of convention of delegates from Liberal associations over the country was then meeting at Sheffield. These men, who represent the bone and sinew of the Liberal party, are largely Nonconformists, and are accustomed to apply their moral standards in politics more rigidly than people do in Parliament. With scarcely a dissentient voice, they declared that unless Mr. Parnell retired at once, the Irish policy of the Liberal party would be fatally discredited and the next general election lost.

Mr. Gladstone had been completely surprised by the issue of the divorce suit, but had waited for Mr. Parnell to take the course which the interests of Ireland required. Now that Parliament was on the eve of meeting, and the Irish members had to elect their leader for the coming session, some deliverance from the chief of the Liberal party became necessary. Accordingly, he saw Mr. Justin McCarthy, and conveyed to him his conviction of the absolute necessity of Mr. Parnell's retirement. Mr. McCarthy conveyed the message to Mr. Parnell, but the latter not only disregarded the warning, but gave no indication of it to the Irish members when they met, and Mr. McCarthy unfortunately omitted to convey it to them. They reëlected him, and in doing so, after they knew or might have known the sentiments of their English allies, repeated the blunder of the Dublin meeting. There was consternation in the Liberal camp, and men believed that the Ministry, taking advantage of the panic among their foes, were on the point of dissolving Parliament. Next day, and not a day too soon, Mr. Gladstone launched the manifesto in which he declared that Mr. Parnell's conduct had been such that no leader of the Liberal

party could henceforth coöperate with him, and that if the forces of home rule were to prevail in England, the Irish wing of the allied army must be commanded by some new chief of untainted reputation. The effect of this deliverance was immense and sudden. It stopped at once the English invectives against Mr. Parnell. The Liberal speakers and journals paused, because Mr. Gladstone had said all they wished to have said. The Tories stopped in surprise, and waited to see what would happen next.

The Irish members, startled and alarmed, summoned another meeting to consider their position; and Mr. Parnell himself, finding all England against him and Ireland breaking from his arms, shot his answering bolt, and denounced Mr. Gladstone and his colleagues as men who desired to palm off upon Ireland a hollow and unreal home rule, and to get rid of himself because they looked on him as an obstacle to their designs. The audacity of this flank movement took every one's breath away. Those who knew Mr. Gladstone's intentions, and remembered that it was Mr. Parnell's own conduct and the judgment of the English Nonconformists on it that had brought about the crisis, held his charges to be groundless. But the diversion succeeded. The susceptible patriotism of many Irishmen took the alarm. Others, who saw through Mr. Parnell's trick, nevertheless feared to ignore the issue he thrust upon them. And the Tory press, headed by the *Times*, gave them effective aid by professing to believe Mr. Parnell's version of his communications with Mr. Gladstone, and treating the question as if it were a struggle between the two men as to which should guide and direct the home-rule movement. In fact, from that moment on, the *Times* and many other organs of the anti-Irish party have done their best to back up and strengthen Mr. Parnell, whom till then they had loaded with abuse.

The second act of the drama opened with the meeting of the Irish members, at which an attempt was made to recall the previous vote and depose Mr. Parnell. Of the fierce debates that followed, marked by occasional violence, but adorned by many powerful and brilliant speeches, little need be said. Mr. Parnell's adroit manœuvre diverted them from the real issue—that of his own unfitness to carry to victory a cause which requires the support of English Liberals as well as Irish Nationalists—and made them turn on the question of Mr. Gladstone's attitude towards Irish autonomy and the probable provisions of his next Home-Rule Bill. The pertinacity, the courage, the resource, and the shameless unscrupulousness with which he fought his battle during many fatiguing days against able antagonists, have been seldom equalled in our Parliamentary annals. After having drawn the hostile majority into a trap by getting them to consent to send a deputation to interrogate Mr. Gladstone, and placed them in a false position when the Liberal leader declined to give pledges which would immediately have been twisted against him, he resumed his obstructive tactics, and showed plainly that he would not, as Chairman, put the question of his own dethronement. The majority have been much blamed for their submissive long-suffering, but it must be remembered that they foresaw a struggle in Ireland, and were anxious to prepare for it by giving their slippery foe no ground for complaining of harshness or foul play. When at last they broke away, and deposed him by a vote of forty-five to twenty-eight, every one felt that the second act did not end the drama, but that other and still more exciting scenes remained to be played out in Ireland. These scenes of the third act are still proceeding, and opinion is hotly divided as to the probable result. The crowds of the towns and generally the more violent sections of the Nationalist party are with Mr. Parnell. The country folk, who are more apt to follow local leaders, and are largely influenced by the bishops and priests, seem disposed to turn against him. Present probabilities point to his defeat, but he may be able, though defeated, to maintain himself for some time to come at the head of a considerable faction, both without and within the House of Commons.

To English observers his attitude appears a purely selfish one, and the conduct of those Irish patriots who support him is, in their view, sheer lunacy. He has hopelessly alienated English opinion, and the adhesion of English opinion to the home-rule cause is the first condition of success. He has been undoing the whole work of the last five years in denouncing the English to the Irish and in trying to rekindle the old distrusts and animosities. In spite of this, there are able and honest Irishmen who cling to him as their only possible leader. Some are fascinated by the strange personal power he possesses, the power of an intense, passionate, and self-confident nature. Some are swayed by sympathy and gratitude for what he has suffered and accomplished previously; and sympathy goes a great way when it induces them to believe (as many in Ireland do believe) that he is an innocent man, the victim of English prejudice and a foul conspiracy to which the judge and jury in the Divorce Court were parties. Some hold that he alone among prominent Irishmen has the dictatorial qualities which are needed to hold a fighting force compactly together, and that a united Irish Parliamentary party is more essential to success than even the help of a great English party. To argue thus, however, is so completely to ignore the blow Mr. Parnell has himself dealt at his own prestige and authority for the future, that it is scarcely less strange than the credulity which holds a man guiltless of acts which he did not deny in court and has not since denied.

Meanwhile, how have the prospects of politics in England been affected by this sudden change in the Irish landscape? The Tory press, with which of course the *Times* must now be classed, and not a few Tory speakers have played a somewhat discreditable part. They opened fire upon Mr. Parnell as soon as the verdict was given, and treated his immoralities with much more severity than has been shown to the graver transgression of several conspicuous personages during the last ten years. A far more revolting case, which was tried about the same time, and which affected the Governor of Madras, who had been a member of a recent Tory Government, was passed over with scarcely a word of comment. The *Times* treated the Liberal party as alone besmirched by Mr. Parnell's transgressions, though his criminal intrigue must have been well known to most Tory as well as to most Liberal politicians in 1885, when the Tory chiefs were in virtual alliance with him. As soon, however, as Mr. Gladstone's letter declared that he could have no more to do with Mr. Parnell, the Tory organs went round and began, if not to defend the Irish leader, yet to give him all the help they could by representing the anti-Parnellite members as no better, although less able, than he was, and by denouncing Mr. Gladstone's attempt to dictate to Ireland whom she should follow. Lord Salisbury, who is conspicuous in our politics for a want of good taste and good feeling, went so far as to say that, looking at the matter as a betting affair, he would "put his own money" on Mr. Parnell, and had no doubt that English Tories were doing so. Many Tories of the less violent sort have, it need hardly be said, refused to follow the Prime Minister's bad example. But on the whole, the tone displayed by the heads of a great party in this transaction has not raised their position in the eyes of impartial men, while the dignity of Mr. Gladstone's manifesto won for him a good deal of applause even from opponents, and rallied his old friends heartily round him.

Whether the respective voting strength of Tories and Liberals has been affected is a serious question, in view of the approach of a general election. The contest just decided in the Bassetlaw division of Nottinghamshire has gone rather heavily against the Liberals, but this may be due to local causes, and the district has for some time past been deemed a Tory stronghold. However this may be, it is plain that the spectacle of disorder and confusion in the Irish party, and the moral ruin of a man who had been looked on as the embodiment of Irish Nationalism, cannot but injure the party which has made home rule the main plank in its platform. This injury may be repaired if Ireland should herself declare against Parnell before Parliament is dissolved. But it will be deepened if he succeeds in regaining his control, or even in maintaining himself at the head of a powerful faction. T.

PARNELL VS. IRELAND.

LONDON, December 11, 1890.

ANOTHER miserable page has been opened in the miserable history of Ireland. She is again divided against herself. She showed the tendency of weak nations to seek union through the acknowledgment of a dictator. Power has demoralized that dictator. When obliged to choose between personal ambition and the unity of the movement he had guided, having come to regard himself as personifying the cause, he has proved ready to sacrifice all to personal ambition. In the transactions of the last three weeks no section of the National party is free from blame, yet to those of them who have been within the inner circle each phase is more or less accountable. On Tuesday, the 18th of November, the results of the divorce suit were known over Ireland. The incomparable services of Mr. Parnell, the belief that the unity of Irish feeling could be maintained only under his leadership, carried away all but a very few, and at the National League meeting that day only adulatory language found expression. A mass-meeting in the largest hall in Dublin had been called for Thursday, in advance of the verdict, by those expecting that Mr. Parnell's character would be cleared, and desiring an opportunity of announcing before the opening of Parliament their adhesion to a home-rule policy. It was not surprising that, under the circumstances, a resolution was unanimously passed "that in all *political* matters Mr. Parnell possessed the confidence of the Irish nation.' Mr. Justin McCarthy's statement carried much weight with waverers, that if counsel had been allowed by Mr. Parnell to cross-examine witnesses, a different complexion would have been put upon the case. Next Tuesday, the 25th, Parliament was to meet, and the Irish party was, as usual, to choose its chairman. Many came to London in bewilderment if not agony of mind. One at least consulted one of the most high-minded British statesmen and of

Ireland's best friends. He said it was essential for the party to maintain its unity, and that the meeting would have the advice of the Liberal leaders.

The meeting of the party was not entirely enthusiastic. Many members sat silent. Till the last moment it was thought by some that the way was merely being made easy for Mr. Parnell to retire; that, having been paid the compliment of a vote of confidence in him as political leader, he would, for the good of his country and the unity of the party, lay aside the proffered trust. For from the moment we mixed with our English friends in the lobby of the House the majority realized, as none of us had realized in Ireland, that the Liberal alliance was for the present at an end, and home rule indefinitely postponed, if Mr. Parnell's leadership were maintained. Also, many had not been prepared for the high and sincere firm stand, on moral grounds, of their English allies. We were puzzled by the absence of the promised communication from the Liberal chiefs; could it have been withheld because our conclusion was in consonance with their own? The non-communication of this advice, whatever its cause, has not been satisfactorily explained. Impressions had been given by some of the intimates of Mr. Parnell, that he meant to retire. The appearance next morning of the letter from Mr. Gladstone announcing his probable retirement from public life, and the certain abandonment of the combined action of his followers with the party, if Mr. Parnell's leadership were continued, completed our disillusionment. In some way we had been betrayed, and in acknowledging this, we acknowledged a certain want of judgment on our own part. We had created a Frankenstein monster that would impede our entire course. And all the events of the past fortnight (into which, to many of us, the feelings of a lifetime have been compressed)—the manifesto of Parnell, his turning upon Gladstone as "a garrulous old man," the utter absence of apology from him, his denunciation of any apology attempted by others, his perfect self-command, only interrupted occasionally by flashes of passion—convinced us that we were not dealing with a man weakened by any aberration of mind, but with one of iron will, of matchless determination, of indomitable persistency, who regarded himself as above and beyond ordinary men.

Irish history from Wednesday morning, the 26th of November, when we of the majority clearly conceived our position and duty, till the afternoon of Saturday, the 6th of December, when, as the only remaining means of concluding matters, the majority left Parnell and his party in possession of committee-room No. 15, was the history of a struggle between men of two turns of mind—those believing that home rule could be won only with Parnell, and those believing it could now be won only without him. With one or two exceptions, the decision appeared to be made that morning unanimously and simultaneously. The strangest and most inscrutable of all psychological problems was presented—a vital difference of opinion among men of equally honest intentions regarding a subject on which all had equal opportunities of judging. Anticipating such a division, knowing intimately most of the men as I do, I should have been utterly mistaken for the most part in my prognostications as to the sides individuals would take. Brother, it is true, stood to brother; son—though only at the last—stood by father; the closest friends, as a rule, kept together; but in the main the results were unexpected. For the first time is revealed the extent to which each man really believed in Parnell, really believed in Gladstone, really believed in an alliance with the English Liberal party. It is best so; the air is cleared, and, though the road is obscured, at least we fully know the position of our fellow-travellers. In the breaking it seemed to me that I for the first time fully appreciated the temper of which the party had been forged.

It can no longer be regarded as a mere instrument in the hands of Parnell: two-thirds of the members depending entirely for support on an ample fund, supposed to be completely at his disposal, ranged themselves against him. As to the attractions of London drawing-rooms, society and club life open to Irish members in alliance with the Liberal party, the very men who most enjoyed and appreciated them have followed Mr. Parnell into the cold. Religion had nothing to do with the decision: only four of the twelve Protestants have sided with Parnell. Nor had the sympathy of suffering and imprisonment: fourteen of the twenty-three who had so suffered, and among them those who had suffered most, are opposed to him. Nor does the majority include all those who were of primary importance in the working of the movement: I have noted twelve such, all Catholics, four of whom adhere to Parnell, and one of these, John Redmond, stands among them in the front rank for oratorical power, honesty of purpose, and statesmanlike ability. Mr. Parnell has certainly carried away with him the rougher elements. On the other hand, those members who spring most from the people, and who are most committed to the cause of the tenants and most responsible to them, have sided against him. The three gray-headed survivors of Butt's movement of 1870, who saw the entry of Parnell into public life, are now most opposed to him. He has the best organizer, Mr. Timothy Harrington. He apparently holds the "offices" in both London and Dublin; he carried the control of the League in Ireland; it is to be feared he has entire command of the Treasury. During late years he has steadily put aside all attempts at divided control. His overwhelming influence was sufficient to suppress even the suggestion of doubt as to the wisdom of such an arrangement. Is it not now clear that this was due to his foreseeing possibilities such as the present, rather than, as we supposed, to the broad looseness of arrangement through which alone, apparently, we had been brought so far safely, escaping the differences inevitable under a more rigid system?

To the majority it is evident that infatuation for a woman, a frenzied desire to have her as his wife, alone can explain his steady determination all through to offer no apology for his conduct, to make no excuse, where, doubtless, many might be made, to leave no loophole for the Queen's Proctor intervening to prevent a divorce. The overwhelming fascination she must have exercised over him accounts for much that was inexplicable in his conduct in the last eight years. Since the time when, as we now know, he became acquainted with her, Parnell was a different man from the Parnell of previous years, just as the Parnell of the past fortnight, who has now nothing to conceal, is again like a different individual. It has been well said that if he had exerted as much zeal and ability in fighting Lord Salisbury during the past four years, as he has during the past fortnight in maintaining his position, the Conservative Government would not now be in power.

But to return to the discussions in No. 15. They were carried on ably and in a fair spirit. Through sitting after sitting, some of ten hours' duration, ten minutes, perhaps, on the whole, would have covered the moments of excited passion. These moments were grossly exaggerated and emphasized by the press. The allegations regarding violence and disorder at the last were unfounded. From only one man at any time was physical violence feared. Never did Parnell show more astuteness than in the conduct of these proceedings; in managing *de jure* with fairness, insisting that each side should have a fair hearing, while *de facto* manœuvring to his own ends. The occasion appeared to lift men above themselves; lips till then in Parliamentary career silent or only faltering were, as it were, touched with fire. John Redmond exceeded himself. Arthur O'Connor's speech was most dignified and deeply pathetic. Mr. Sexton more than sustained his character for statesmanlike power. One of the best arguments against Parnell was advanced by a young man, M. J. Kenny, in listening to whom one of the party was renewedly impressed by Mr. Parnell's prescience and insight, remembering how, many years ago, when he had questioned the leader as to the advisability of restraining Mr. Kenny's youthful impetuosity, the answer had been, "No; that young man will come all right; it is best not to discourage him." I consider that a discussion on so burning a question could not have been carried on by any party in the House in a better spirit or on a higher plane, and I thought a certain wealthy British member was right when he said he would gladly give £50 to have been a listener. It was in the main a contest between men till then bound together by the strongest ties, and who still desired unity. In a great Irish epic, the 'Tain Bo Chuailgne,' it is related how, in the strife at the ford between Fergus MacRoy and Conor MacNessa, those heroes (once close friends) in the pauses of the struggle occasionally embraced and kissed each other. Much was there in our sad struggle of the last few days to recall this mythical incident.

But in Ireland, where the last appeal must be made, how does the question stand? We have acted regarding our constituents according to the views of Burke, that to these we owe everything, especially our "unbiassed opinion," our "enlightened conscience," our "mature judgment," which we "ought not to sacrifice to them, to any man, or to any set of men living." We hope that on mature reflection Ireland will approve our action. If not, we must go. At present, appearances are against us. When the leading National paper, the most influential organ of public opinion, the *Freeman*, strongly opposes us, when it has come to throwing aspersions on the character and intentions of William O'Brien and John Dillon, and assaulting T. M. Healy in the streets of Dublin, matters have gone far. The very man who a few weeks ago arranged O'Brien and Dillon's escape, and navigated their yacht to Havre, was yesterday the principal instrument in seizing the office of *United Ireland*, and destroying an edition of the paper because it supported views which they have espoused. The opinion of most of the conscientious and thoughtful and refined Home-Rulers of my acquaintance in Ireland is against us, and the general current of adverse opinion there must be powerful. The counsel of the Protestant Home-Rule Association has declared for Mr. Parnell. An able bank director, a man of the highest character, who returned to Ireland a few days ago strong for Gladstone, after having offered, if necessary, to contest an Irish seat against Parnell, wrote to me next day to reserve my judgment, and shortly afterwards that he had gone over

to Parnell. In a letter received a few days ago one of my best advisers there writes: "It seems to me that you might have sided differently if you had remained in Ireland; that you would almost certainly have done so had you never been in Parliament. As always, I sympathize more with Gladstone than with Parnell." The Ascendancy party in Ireland, with a keen perception of their own interests, are for the first time recognizing the merits of Parnell. For myself, from the first moment that I realized the feelings of our English allies, the course appeared clear. Never in all the distressing differences of the past twenty years had I less difficulty in coming to a conclusion. Through only one night was my rest disturbed, that following the day upon which compromise seemed probable. On the decision of Ireland during the next few months it depends whether home rule is attainable within a reasonable period, or whether it be relegated to the distant future. But in either case the position of thousands in Ireland is most pitiable, who, abandoning their homes upon the assurances of a speedy settlement in their favor, are now, through fatal divisions (and we of our party believe through the selfish ambition of one man), plunged into a condition from which it may be difficult for either party to extricate them. D. B.

NICOLAS FOUQUET.

PARIS, December 10, 1890.

I HAVE never been to Turin without glancing, on the way, as I arrived in the Italian plains at the foot of the Alps, at the distant castle of Pinerolo, which stands on one of the outlying branches of the chain, and without thinking of the Iron Mask, and of the Superintendent of Finance, Foucquet, who had been kept in the prison of the castle, at the time when Pinerolo was French and looked on Italy as a French sentry.

The name of Foucquet will always be associated with Pinerolo as well as with Vaux. "It is at Vaux," says Mme. de La Fayette in her 'History of Henrietta of England,' "that the ruin of M. Foucquet was decided on, and that the King consented to abandon him." Recent historical works show us that Louis XIV. had determined to condemn Foucquet, his Minister of Finance, even before he had condescended to visit him in this famous place, which had been built and adorned at so much expense. Some years ago M. Chéruel (who is engaged in continuing the publication of Mazarin's correspondence), published two volumes, full of information, under the title of 'Memoirs on the Public and Private Life of Foucquet.' Very recently M. Jules Lair has given us two volumes, 'Nicolas Foucquet, Procureur-Général, Surintendant des Finances, Ministre d'État de Louis XIV.,' which complete the work of M. Chéruel, and really exhaust a subject which will always be interesting to the lovers of French history.

When Mazarin was at the point of death, he spoke to the young King, Louis XIV., of his possible successor. He praised three of the ministers, Le Tellier, De Lionne, and Foucquet, and spoke at length of the last, who knew well what concerned the finances and the administration of justice. Mazarin died at the Château de Vincennes on the 8th of March, 1661, and the King called round him, with the three ministers just named, the Chancellor Séguier, the two Briennes, etc. Speaking to the Chancellor, the young King said: "Sir, I have called you here, as well as my ministers and my secretaries of state, to let you know that hitherto I have been willing to have my affairs conducted by the late Cardinal. It is time that I should govern myself. You will help me with your advice when I ask you to give it." Then, turning round to Foucquet, he said: "As for you, Mr. Superintendent, I beg you to employ Colbert, who has been recommended to me by the late Cardinal."

Consciously or unconsciously, young Louis XIV. (he was then only twenty-two years old) brought face to face two mortal enemies, Foucquet and Colbert, both self-made men, both remarkable administrators. Mazarin thought so well of Colbert that he said to the King, a short time before his death, "I owe you everything, Sire, but I believe that I acquit myself in some manner by giving you Colbert." Born in 1619, the son of a cloth-manufacturer of Reims, Colbert had himself worked for some time at a manufacture. He had risen by his own merit, and had become since 1648 the intendant of Mazarin. "He was a man," says Gourville (a good judge, who had made a similar fortune in the service of the houses of Larochefoucauld and Condé), "born for work above anything that could be imagined. He had a perfect judgment, an iron will, and a degree of integrity and honesty which sometimes bordered on harshness."

M. Lair gives very copious details on the family, the youth, and the early career of Nicolas Foucquet. He was one of the twelve children of François Foucquet, counsellor of the Parlement of Paris. He was born in 1615, was first destined for the Church, became counsellor of the Parlement of Metz, and, having bought the office of *maître des requêtes*, came to live in Paris, and became at the age of twenty-one the colleague of his father. His oldest brother was Bishop of Bayonne, and, his father having died in 1640, Nicolas became the protector of his family. Between the years 1643 and 1648, he was Intendant of Police, Justice, and Finance in the French armies, in Dauphiné, in Catalonia, in Flanders. Mazarin called him near him when the troubles of the Fronde began. Civil wars give resolute men fine opportunities. Mazarin soon discovered great qualities in Foucquet, and, being at drawn daggers with the Parlement of Paris, he resolved to appoint Foucquet Procureur-Général of the Parlement, so as to secure for himself a solid ally. Foucquet entered on his difficult office in 1650, and maintained himself with much ability during the difficult times of the Fronde.

Turenne and Condé were at war. Turenne fought in defence of the young King, and Condé was the head of the rebellion against Mazarin. The two adversaries met in the Faubourg Saint-Antoine, where a most bloody battle was fought. The "Grande Mademoiselle" saved Condé by firing the cannon of the Bastille on the victorious troops of Turenne. A few days later, after the massacres of the Hôtel de Ville, Foucquet urged the Parlement to leave Paris and retire to Pontoise. He took the minority with him to Pontoise; the majority remained in Paris. There were in reality two Parlements, but the secession of Foucquet with the "gens du roi" helped Mazarin in his negotiations; peace was signed, and all the members of the Parlement met again at the Louvre in what was called a "lit de justice." Young Louis XIV., after his exile from his capital, found himself again in it, and Foucquet made a speech in which he celebrated the triumph of the royal cause.

It is not to be wondered at if, after his great services in the Parlement, he obtained without difficulty the office of Superintendent of Finance in 1653, after the death of La Vieuville. After years of civil war, the finances of the country were in a most embarrassed state. M. Lair gives interesting details on this point, and has a long study on the administration and collection of the public revenues in the seventeenth century. All the sources of revenue were farmed, and much remained in the hands of the farmers; the royal treasury received but a small fraction of the direct taxes (which consisted of the *taille* and the *capitation*) and of the indirect taxes (which consisted of the *aides*, the *gabelles*, the *octroi*, the custom-house taxes). The confusion of ideas in these times was such that it was possible for Mazarin, who was Prime Minister, to be at the same time contractor for the armies; that Foucquet could be at the same time Minister of Finance and Procureur-Général of the Parlement. The division of powers which is now classic in all civilized countries did not really exist. All was confusion and disorder; the science of finance was not yet born.

Foucquet had a brother, the Abbé Foucquet, who was a man of pleasure, and who, after having been appointed by Mazarin chief of police, used his influence for the satisfaction of his pleasures. Among his mistresses Bussy-Rabutin names the famous Duchess of Châtillon; this love affair ended in a quarrel, and the Grande Mademoiselle writes in her memoirs: "Who would have said to Admiral Coligny, 'The wife of your grandson will be beaten by the Abbé Foucquet'? He would not have believed it." The Abbé Foucquet quarrelled with his brother and became one of his enemies. The Superintendent committed a great error at the instigation of Mazarin. Belle-Isle-en-Mer belonged to the house of Retz. Mazarin asked Foucquet, who had become rich in his office, to buy the marquisate and the estate of Belle-Isle. The price given for it was 1,300,000 livres. Foucquet had thus in his hands a stronghold; he was in position, if he so wished, to begin a civil war. His wealth began to scandalize many people; he was a sort of Mæcenas—he patronized Corneille, Molière, Le Nôtre, Mignard, Lebrun, Lafontaine; among his friends we find Madame de Sévigné, who remained faithful to him after his downfall. He had a squirrel in his arms, and his motto was "Quo non ascendam?" He was fond of fine bindings; I have seen some of them, on which, oddly enough, there is a royal crown above the squirrel. (I remember a fine Plutarch with this binding.) Some people maintain that for a moment Foucquet was a little out of his mind; he had what the modern doctors call "the insanity of greatness," a well-known cerebral disease.

Colbert was watching him all the time, and did not hesitate to hold up to Mazarin all the disorders of Foucquet's administration. Mazarin, who had acquired an immense fortune himself, and knew that his own record was not clear, did not push matters to extremities. It suited his policy to employ two men who hated each other. He told the truth about them both to Louis XIV., and, after his death, the young King made it his duty to do what the Cardinal would not do himself. Mazarin thought he could atone for his own malversations and robberies by making a donation of his whole fortune (valued at thirty millions) to the King. Louis XIV. nobly refused the gift—he could not be under obligation to a subject; but he determined to purify the administration, and everything tends to prove that Foucquet was lost as soon as Louis ascended the throne. The King only waited for an opportunity. Foucquet was so blinded that he thought for a moment he should himself fill the place of Mazarin; but Louis XIV. said distinctly that he would be his own Prime Minister. He made

the visit to Vaux on the 17th of August; on the 5th of September Foucquet was arrested at Nantes, by D'Artagnan, lieutenant of the King's musketeers (one of the heroes of Dumas's novel, 'Les Trois Mousquetaires'), and taken to the castle of Angers.

The trial of Foucquet was conducted without the forms of the time; his houses were confiscated, his papers were seized, and an inventory of them was made. Foucquet was transferred to Vincennes, and there he was examined and cross-examined on a number of points. A chamber of justice was appointed, and he was allowed to make his defence. The chamber of justice sat at the Arsenal, and afterwards at the Hôtel Séguier. We could fill the shelves of a small library with all the memoirs written by the lawyers during the trial, which lasted an unusually long time. Foucquet was accused of high treason; he was finally condemned to perpetual banishment, and the King commuted the penalty into a perpetual imprisonment.

Foucquet left the Bastille, where he had been imprisoned during the latter part of the trial, and was conducted to Pinerolo, where he was kept in the strictest confinement, without any news of his family. For a little while he was transferred to Le Pérouse, and then taken back to Pinerolo. His valet, Laforêt, tried to help him escape, and was hanged for it. Foucquet had a companion after a while, the famous Lauzun. The King allowed them to see each other, and, at the end, he allowed Foucquet also to see the members of his family. The two prisoners were transferred to Exilles; after the death of Lauzun, Foucquet was taken first to the Island of Ste. Marguérite, then to the Bastille, where he died in 1705, after thirty-four years of captivity.

Correspondence.

THE LOYAL REMNANT AND THE FORCE BILL.

To the Editor of The Nation:

Sir: I transcribe below, from our State archives, certain hitherto unpublished resolutions adopted in Winston County, Ala., in November, 1861. These resolutions were passed at a meeting of Confederate sympathizers called to consider measures "for suppressing and holding in check a widespread spirit of disloyalty and rebellion which is found to exist to an alarming extent in Winston County." If it is considered that Winston County was at that time more or less fairly typical in opinion of a respectable minority in this State, it is possible to judge of the soundness, from a party standpoint, of a legislative policy, like the reconstruction laws, that disregarded this minority's existence. Whatever may be thought of the larger and more enduring consequences of reconstruction—for one, on this point, I accept the consistent teaching of the *Nation*—there can be no doubt that its immediate and continuing effect on the Republican party at the South was disastrous in the extreme.

Just now, when the harsher memories of that period have begun to fade, and the Southern whites have begun to divide on economic rather than race issues, the Republican leaders come forward with legislation the almost certain effect of which will be to restore solidarity to the Southern whites, and so insure the indefinite supremacy of the old order. There is, so far as the writer's observation extends, but one opinion at the South as to the effect the enactment of the Lodge Bill would have upon the fortunes of the Democratic party here, and that is, as a party, it could wish for nothing better. The enactment of the law is greatly dreaded because it is believed the result would be to embitter relations between the races, more kindly now than they have ever been, and in manifold ways break up the healing forces at work in the South.

Here are the Winston County resolutions:

"Whereas, according to the vote in the late election for Representatives, it appears that there are in this county only 128 secessionists and loyal voters, and that there are about 515 avowed Unionists, who declare themselves openly in favor of the Union;

"And whereas, these said Unionists have formed themselves into volunteer military companies for the purpose of defending the Union, and have banded themselves together in armed companies for the purpose of drilling and practising the use of firearms in obedience to public notice;

"And whereas, every effort has been made by the good citizens, both by personal and public appeals, to win the said Unionists to loyalty to the State of Alabama and the Confederacy;

"And whereas, by the special request of his Excellency, Gov. A. B. Moore, the Hon. Geo. Houston lately visited the county of Winston, and made the most fervent and eloquent appeals to the said disaffected citizens, with the hope of exciting in them a spirit of fealty to the Government;

"And whereas, all these efforts have not only failed to produce any good effect, but, on the contrary, it appears that the spirit of rebellion grows more open and violent every day;

"And whereas, out of the 128 loyal citizens of the county 70 are in the service of the army, but not one single man of the 515 Unionists has volunteered, but, on the contrary, whenever an effort is made to get volunteers, the said Unionists concert together to prevent it and declare that they will fight for Abe Lincoln before they will fight for Jeff Davis;

"And whereas, strangers of suspicious character have been lately seen among said Unionists, and from recent circumstances it is evident that they have communication with the enemy;

"Now, therefore, in view of these facts and many others which we might state,

"Resolved, 1st, That we earnestly petition his Excellency the Hon. John Gill Shorter, to intervene by a vigorous exercise of the Executive authority to suppress and strangulate the said spirit of disloyalty and rebellion;

"Resolved, 2d, That we recommend that each citizen of the county be required to take the oath of allegiance, and that all who refuse to do so be dealt with as aliens;

"Resolved, 3d, That we recommend, if it can be constitutionally done, that a requisition be made upon the county of Winston for at least 250 soldiers for the Confederate Army."

Thomas H. Clark.

Montgomery, Ala.

FELO DE SE.

To the Editor of The Nation:

Sir: That a penny-a-liner should write of a man's "perpetrating felo de se" is not at all surprising, when one considers how frequently juries are found to announce that "the verdict is felo de se," parallel to which, however, would be the announcement, "the verdict is a burglar." But the mistake here indicated, that of substituting a person for an action, as in the case of *suttee* for *sutteeism*, has not been, by any means, confined to the vulgar. Like *homicide*, *parricide*, and the rest, *suicide*, apart from its context, is ambiguous; and its equivalence, in one of its acceptations, to *felo de se* may have led to the idea that the legal technicality represents also its other acceptation. The fact that it was the Low Latin *felo*, *felonem*, that gave us *felon*, just as the classical *carbo*, *carbon-em*, gave us *carbon*, cannot have occurred to the authors who have supplied the subjoined quotations:

"I made some occasional attempts at *felo de se*." B. R. Sheridan, *Critic* (1779), act. i., scene ii.

"Such fools commit *felo de se* on sense." W. H. Ireland, *Modern Ship of Fools* (1807), p. 109. Here the misused term stands for "murder," not "self-murder." "To become a plagiarist upon himself, by committing a political *felo de se*." *Id.*, *Scribbleomania* (1815), p. 48, note.

"The unhappy Duke of W——n had committed *felo de se* in a state of insanity." Albany W. Fonblanque (1830), *England under Seven Administrations* (1837), vol. ii., p. 52. But the suicide of the insane is not accounted felony.

"We shall expect to see it illustrated in acts of *felo de se*, or deaths by melancholy." *Id.* (1831), *ibid*, vol. ii., p. 109.

"And the Jury debated, from twelve to three, What the Verdict ought to be; And they brought it in as *Felo de Se*, 'Because her own Leg had killed her.'" Thomas Hood, *Miss Kilmansegg* (1840), in *Works* (ed. 1848), vol i., p. 269.

"The supremacy of the Crown . . . has died by *felo de se*." Cardinal Manning, in *Essays on Religion and Literature*, Second Series (1867), p. 19.

It will be admitted that, of all men, a learned lawyer should be counted on for employing the phrase in question with unfailing propriety. Yet Mr. F. N. Rogers, Q.C., in his 'Ecclesiastical Law' (1840), p. 129, after rightly speaking of "the private interment of the remains of a person *felo de se*," has "the verdict of *felo de se*," thus lapsing into the inaccuracy so common among laymen.

Not wholly dissimilar to the solecism animadverted on is, "he has *malaria*," or "he has caught *malaria*," an expression often seen in American newspapers, and heard in conversation with Americans. Before this can be legitimate, *malaria* must, after the analogy of *cold*, come to mean a disease. At present it is not a whit less wrong than would be, "to have *frost* or *lightning*," where what is intended is the effects of one or other of them.

Your obedient servant, F. H.

Marlesford, England, November 22, 1890.

P. S. Turning over my notes, I find something to add to two of my recent letters.

Of rare, and mostly frivolous, verbs in *-fy* the list which I gave can be largely supplemented. A few more that seem to be new to the Dictionaries are: *Complexify*, *drunkify*, *essayfy*, *hypocrify*, *jollify*, *lilify*, *partify*, *preachify*, *popefy*, *scenefy*, *superdevilify*, *Torify*, *tutorify*.

In Act v., Scene iv., of the *Cheats* (1662) by John Wilson, is found, as printed in his *Dramatic Works* (ed. 1874), p. 98:

"Mrs. Whitebroth—How will the old enemy erect himself!

Mrs. Mopus—And the holy sisters be humbled!

Mrs. Wh.—Who shall carry on the great work?

Mrs. Mop.—Or perfect that which you have begun?

Mrs. Wh.—Mr. Scruple *transmogrify*?

Mrs. Mop.—Ah, no! (Both of them. Hui!)"

F. H.

Notes.

Harper & Bros. have nearly ready an 'Elementary Latin Dictionary,' by Charlton T. Lewis.

The next volume of the series of "English Actors," edited by Mr. William Archer and published here by Longmans, Green & Co., will be a Life of Betterton, by Mr. R. W. Lowe, the editor of the recent excellent editions of Cibber's 'Apology' and Doran's 'Annals.' It will be ready next month.

Mr. Elkin Mathews of Vigo Street, London, is about to issue a pamphlet "addressed to authors and others," by Mr. C. T. Jacobi, the manager of the Chiswick Press. It is to be called 'On the Making and Issuing of Books.

Prof. Garnett of the University of Virginia has made a volume of 'Selections in English Prose from Elizabeth to Victoria' (Boston: Ginn & Co.), which serves very well as a substitute for a library, where books or time is wanting. He includes only thirty-three authors, but the list is, within its limits, satisfactory, and the small number permits a length of extract to each author which is a gain. We do not believe that either knowledge of style, or acquaintance with literature, or a critical taste can be acquired by such "specimens," or that they are of such use to the young student as would be the reading of a few, even a very few, complete works by great authors; but if the method be adopted by a teacher, a more serviceable body of good English prose than this volume contains is not available.

Henry Holt & Co. have brought out a second edition of Bellows's well-known compact 'French-English and English-French Dictionary,' in which the two parts are carried along concurrently on each page, instead of being separate at the beginning and the end—a very convenient arrangement; and in which there are numerous ingenious typographical devices for assisting the eye or the memory. In essential particulars there is nothing better than this dictionary, especially for conversational purposes. The type is so small, however, that it calls for very careful press-work, even under the best conditions, much more when the plates are somewhat worn. The effect of some pages of the present issue is like that of photographic reduction, and is very trying to the eyes.

The tenth volume of M. J. J. Jusserand's well-edited series of "Grands Écrivains Français" is M. Maxime du Camp's sketch of his friend Théophile Gautier (Paris: Hachette; New York: F. W. Christern). No reader of this book will wonder why it was that Gautier, a man of great ability, made no mark as a dramatic critic; M. du Camp makes it obvious that Gautier hated music and the theatre almost as much as he loved travel and poetry. It is only when a man delights in his work that he puts into it the vital spark. Gautier's dramatic criticisms, or a few of them, are to be had in six volumes, and they gather dust on the shelves of students of the French drama, while 'Tra los Montes' and 'Émaux et Camées' pass from hand to hand, and get themselves worn out by perusal. Hating the theatre as he did, and despising it, Gautier's honesty is the more to his credit; he did his work carelessly often, but never under influence. M. du Camp sets down a conversation he had with Girardin (once Gautier's editor-in-chief), who called his critic a fool for not selling his *feuilleton* to the theatrical managers. M. du Camp divides his biography into five chapters, devoted to Gautier's youth, his criticisms, his travels, his tales, and his poetry. On p. 200 we learn that Gautier wrote a *feuilleton* the day his mother died, and that the pay served to bury her—just as Dr. Johnson wrote 'Rasselas' to pay for his mother's funeral expenses.

The seventh volume is now ready of M. Auguste Vitu's 'Les Mille et Une Nuits au Théâtre' (Paris: Ollendorff; New York: F. W. Christern). It contains the dramatic criticisms which M. Vitu published in the *Figaro* from April, 1880, to June, 1881, during which period "Divorçons" and "Le Monde où l'on s'ennuie" were the most important plays produced. There is also a pleasantly erudite article on the revival of Molière's "Impromptu de Versailles."

Obviously incited by the success of Mr. Jerome K. Jerome's clever little book on 'Stage-Land: Curious Manners and Customs of the Inhabitants,' Mr. Percy Fitzgerald has now prepared a little book on 'Music-Hall Land: An Account of the Natives, Male and Female, Pastimes, Songs, Antics, and General Oddities of that Strange Country' (London: Ward & Downey); but his theatrical gazetteer lacks the liveliness and the point of Mr. Jerome's. Nor is it as exact as the paper on the same subject contributed to the January number of *Harper's* by "F. Anstey." Yet in either production the American reader can find a record of one of the strangest of London products—the music-hall—at once like and unlike the Parisian café chantant and the American variety show. It was Planché who called certain songs "most music-hall, most melancholy," and neither Mr. Fitzgerald nor Mr. Guthrie can explain why the British music-hall is inexpressibly depressing to an American.

The second part of vol. ii. of the Final Report of the State Geologist of New Jersey is concerned with zoölogy, and is divided between catalogues of insects and of vertebrates. The first has been drawn up by Prof. John B. Smith, under difficulties, for the collectors have been very unequally distributed, and have confined themselves mainly to *Coleoptera* and *Lepidoptera*, so that, except in these orders, "New Jersey is practically unexplored," and even in these "northern and northwestern New Jersey are entirely unrepresented." Prof. Smith thinks his 6,098 listed species will probably be increased by at least 20 per cent. A certain acknowledged incompleteness attaches also to the descriptive catalogue of the vertebrates, which is a working over, by Dr. Julius Nelson, of Dr. C. C. Abbott's catalogue of 1868. Each species has been described with a view to distinguishing it from its allies, and for the benefit of the gunner and the angler in particular. Dr. Abbott's notes on the habits of the several animals have been retained, and make this section of the volume not unreadable.

From B. Westermann & Co. we have the *Almanach de Gotha* for 1891, still somewhat stouter than heretofore, and more densely packed than ever with the information for which it is famous. A great extension has been given to the third part of its genealogical division, which embraces the princely houses of Europe, non-sovereign, and particularly in the case of those of France. Thus the Duchesse d'Uzès, who poured money so unstintedly into Boulanger's bottomless pocket, is represented with her family, of an old feudal house in Languedoc. The editors of the *Almanach* cruelly give, with the arms of this ducal family, the sadly falsified device, "Ferro, *non auro*." An enormous labor has been undertaken in regard to the princely host, namely, to supply the dates of births and deaths, etc., and naturally only a beginning has been made. One house has lapsed from among the sovereigns, that of Braganza, though it still maintains its place in the *Almanach*. Two of the regulation four portraits in the present volume are of the new King and Queen of Portugal; another is of Gonthier, the new Prince of Schwarzburg-Rudolstadt; the fourth, of Germany's new Chancellor, Gen. Caprivi. Finally, among the useful innovations we remark the localization by street and number of the foreign embassies in the chief European capitals.

The same firm sends us Part I. of the new (fourth) edition of Flügel's 'Universal English-German and German-English Dictionary,' the English-German leading off. We shall review it with care hereafter, and will now only say that it will appear in twelve parts at a monthly rate of issue; that the form is about that of the 'Imperial Dictionary,' but with broader margins and a smaller printed page, in three columns; and that though the type is fine, the impression is remarkably clear. The present instalment reaches the word *bok*.

The most sumptuous of all the Christmas annuals is *Paris-Noël* (New York: F. W. Christern), now in its sixth year. The literature is not remarkable, the most entertaining article being an outline sketch of Paris in winter by M. François Coppée. But the large size of the page allows great variety and richness of illustration. Among the inserted plates are two etchings by M. Mongin and M. Le Rat after Rousseau and Dupré, a double-page lithograph after a drawing in three chalks by M. Chaplin, a double-page photogravure of a picture by M. Brozik, and a double-page half-tint plate of a panel of the new ceiling M. Gervex is painting for the Paris Hôtel de Ville. There is music also to accompany a little pantomime by M. Paul Arène, which Mlle. Abbéma has decorated with tablets in red and black. The color-printing is not remarkably good, but it is very much better than the cheap and empty colored plates of the Christmas *Graphic*, for example. Of all the Christmas numbers published in English, that of *Puck* was most successful in the effectiveness of its color-printing.

L'Art, during the past few months in which we have failed to keep up with its regular fortnightly appearance (New York: Macmillan), has had for its chief continued article, just finished in the number for November 15, the Cathedral of Orvieto. The accompanying designs have been abundant. The Exposition of 1889 is not yet done with, and the reporter who reviews a century of engraving arrives at lithography, an art which suffered directly from the rise of photography, and has fallen into undeserved neglect. Numerous interesting examples are given in *L'Art*. For the rest, we remark a short article on Palladio, and one on Mr. John G. Low and his decorative tiles produced at Chelsea, Mass., in which the writer has some just reprobation of what he calls "le Bill Mac Kinlay," and what our Italian friends call "la legge Kinley," and which by any name is utterly abominable. Among the full-page etchings we remark that after Jean Béraud's painting of the staff of the *Journal des Débats*—more curious for its portraiture than for any artistic qualities. A praiseworthy innovation is found in two photogravures direct from the canvases of old masters. One of these, "The Falconer," was admirably etched many years ago by William Unger for the *Zeitschrift für bildende Kunst*.

The French centennial exhibit is the real subject of Mr. Hamerton's two articles in the November and December *Portfolio* (Macmillan) on "National Supremacy in Painting," though it begins with generalizations which lead one on unsuspectingly. Mr. Hamerton has much to say of the French boycott of English art, which he sums up in the sentence, "There is no conceivable degree of merit that could overcome the objection against English nationality." He thinks this prejudice is giving way before cosmopolitanism in culture and an approximation of the two schools; but one who viewed the Exposition of 1889 is hardly prepared for the remark that "it was possible to go from the Continental to the English galleries without being taken aback by insular peculiarities," whereas in 1855 the transition was "like alighting on another planet." The American school he of course classes with the French; and as he ends by giving the palm of mastery to the latter nation among all who wield the brush, the association is not unpleasant. Some of his remarks on David, Ingres, Delacroix, on Bastian-Lepage (for

whose "Joan of Arc" he imagines the French contempt had it proceeded, as it might have done, from an English pre-Raphaelite), Dagnan-Bouveret, Millet, Rousseau, Corot, etc., are just and very instructive.

With its issue for December, the *Library Journal* completes its fifteenth volume. The number is wholly taken up with the proceedings and papers at the White Mountains Conference of the American Library Association last summer. They are full of interest.

A remarkably good number of the *American Meteorological Journal* is issued for December. It contains an account of local storms at New Haven by H. J. Cox, the Signal-Service observer there; a translation of Hann's important paper on the Temperature in Cyclones and Anti-Cyclones; a special account of observations on Mt. Washington by Prof. Hazen of the Weather Bureau; a discussion and correction of some of Hazen's previous work by Prof. Marvin of the same Bureau (and we may mention here a review of Hazen's book on tornadoes by Blanford, formerly Chief of the Weather Service of India, in *Nature* for October); and several shorter papers, among the latter being a criticism of Russell's theory of cold waves.

Goldthwaite's Geographical Magazine makes its first appearance with the date of January, 1891 (New York: Wm. M. & J. C. Goldthwaite). It has qualities which recommend it for popular reading, and seems to be edited with earnestness; but the time for judging it at its best has not come, as the editor has evidently not yet secured a full collaboration. The magazine is illustrated.

Another new journal with the new year is the *Surrogate* (102 Broadway, New York), edited by John L. Branch. It calls itself "a popular and practical magazine for lawyers, executors, administrators, trustees, guardians, heirs, and legatees," and is published monthly for ten months in the year. Number one has a portrait of Surrogate Ransom of this city.

The first two parts of *Dialect Notes* have come to hand. This is the organ of the American Dialect Society, of which the Secretary is Mr. E. S. Sheldon, No. 27 Hurlbut Street, Cambridge, Mass., and membership in which (securing the *Notes* free) is obtainable on payment of a yearly fee of ten dollars. The contents of these initial numbers may be roughly described as materials for an American dialect dictionary, and will call for a very full index to make the collection available. There are also biographies of American English and of works on Americanisms. The *Notes* are attractively printed, and should find a wide and interested circle of readers and students. The annual meeting of the Society took place on December 30 at Vanderbilt University, Nashville, Tenn.

We notice in the London letter in a recent number of the *American* an instance of the lamb's muddying the wolf's water which deserves attention. This, writes the correspondent, "is the golden age of fourpenny-halfpenny literature, and in witness thereof have we not the *Review of Reviews*, with its melodramatic rhetoric and sentimental cant? . . . Now, judging by its sales, it is the most popular monthly in England . . . It has its imitators in *La Revue des Revues* in France." But instead of the latter publication being an imitation, it is probable that Mr. Stead got his idea as well as his title from the French periodical, which was mentioned in the *Nation* as early as July, 1886.

—The library of the late Professor Heitz of the University of Strassburg is offered for sale, as we learn, upon terms that ought to secure its purchase by some one of our colleges or universities as yet insufficiently provided with the material of classical scholarship. Professor Heitz was himself a learned scholar, known especially for his reëditing and continuation of Otfried Müller's 'History of Greek Literature,' and his Aristotelian studies. His library comprises about 3,500 volumes and about 1,800 pamphlets (programmes, etc.). The best part of it consists of Greek authors (about 1,600 volumes and more than 1,000 pamphlets). Aristotle is uncommonly well represented, not only in the best editions, but in commentaries and treatises on his various works. Latin literature claims about 900 volumes and 300 pamphlets. The history of Greek literature, with that of ancient philosophy, ancient history and geography, has a good proportionate representation, and many rare *opuscula* are to be found in the catalogue under various heads. The books are, with few exceptions, in excellent condition, many of them nicely bound. A card catalogue of them exists, made by Prof. Heitz himself. The principal librarian of the University of Strassburg has made a valuation of the library, estimating it as worth *en bloc* eight thousand marks. This price appears moderate. If further information is desired concerning the library, with a view to its purchase, letters of inquiry may be addressed to Prof. Norton, Cambridge, Mass.

—*Harper's* for January begins a new serial, Charles Egbert Craddock's "In the Stranger People's Country," but otherwise does not signalize the new year's first number. Mr. Warner writes seriously and at length on the prospects of Southern California, with particular reference to the desirability of emigration to that paradise, as he describes it, of climate and fruit-culture; and Mr. Theodore Child contributes an all-inclusive general paper upon Peru, in the South American series. Mr. F. Anstey gives by illustration, but much more by a vivacious and sympathetic pen, a glimpse of the London music-halls; and of most of them a glimpse is quite enough for the reader of ordinary sensibilities. The most interesting paper is Mr. De Blowitz's account of how he became a journalist, and this narrative is of least importance in that part which deals directly with the particular incident that gives it a title; but in the preliminary portion we have a vivid and admirable picture of the political condition of the city of Marseilles in 1870, of the rule of the Commune there in the weeks before it was expressly proclaimed, and of the manner in which the authority of the central Government was restored. Incidentally the sketches of the appearance of southern France during the invasion, of Thiers at Bordeaux and Versailles, and of Paris after the fall of the Commune, are of the best sort of contemporary history. If Mr. De Blowitz's memoirs contain much of the same quality as this chapter from them, they will be of historical value as well as of exciting personal interest.

—*Scribner's* suffers somewhat from a certain belatedness in the contents. To pass over the inevitable misadventure of the article on the Rothenburg Festival-Play, which is saved from being a mere repetition of the account we lately had of it only by its illustrations, the leading article, by Stanley, on the pigmies of the African forest adds nothing to what he has already told us of the race, either in his London addresses or in his volumes, and is noticeable only for the curious effect he notes in himself of contact with undeveloped races, in consequence of which the difference made in man by civilization appears less than we are naturally inclined to think it must be. Prof. Royce's article on Australia also suffers from the fact that he has already told the story at greater length in another magazine, and has cut himself off from that freshness which is requisite in such a contribution. In Mr. W. P. P. Longfellow's survey of the state of architecture at present we find enough to compensate. He takes in a broad field, and he has the happy faculty of throwing side-lights upon his subject from other arts, by means of which his criticism becomes more general and widely applicable. Among the points he makes it is proper to observe his protest against the habit of drawing architecture for magazine illustration with more regard for its pictorial effect than for its architectural value. He singles out Mr. Herbert Railton as a conspicuous example of the designer who resolves a building into a picture. His argument goes to call attention to the firmness, resistance, and in a word the body which architecture must have as its central thought, and to discourage mere color, picturesqueness, and decoration.

—The reports of the Alabama Insane Hospital, at Tuscaloosa, contain matter of such peculiar interest as to deserve the attention of those who are not specialists in alienism. Controversy can hardly arise as to the exceptional merit of this institution on the score of economy and occupation of patients. During the year ending with September, 1890, about 1,050 patients, requiring the attendance and service of over 150 officers and employees, were regularly cared for at an expense of about $130,000. Deducting the amount received from 45 paying patients, some $14,000, the average cost of maintenance was but $117 per annum. This includes, moreover, the expenses of new buildings, repairs, and improvements, which were between $18,000 and $19,000; a new heating plant having been introduced, and a new kitchen and several other structures having been erected. This remarkable result appears to have been attained without stinting the patients, so far as can be inferred from the attractive list of articles of food and clothing supplied. It is partly due to the fact that the hospital premises include a farm and a coal-mine, partly to the fact that the patients labor productively, but principally, of course, to good management. More than 90 per cent. of the female patients and 75 per cent. of the males are usefully employed. The women spin thread from the raw cotton, and make nearly all the clothing worn by both sexes, knitting stockings, making patch-work quilts, doing laundry work, etc. The men work on the farm and in the shops, and grade and terrace and keep in order the grounds. Dancing, in which all the patients are encouraged to join, occupies two evenings a week, while the others are devoted to games, music, and entertainments of various kinds.

—All this, of course, implies the existence of the policy of non-restraint, as to which experts differ and which, of course, we cannot here consider. This policy has been followed at Tuscaloosa for ten years, during which "there has been no resort whatever to any kind of mechanical restraint; not a vestige of restraining apparatus of any kind is to be found about the premises." Dr. Bryce, the Superintendent, declares that he is more and more convinced of the safety and utility of this policy. "The comparative order and quiet that prevail among our 1,100 patients, is evident to every one who visits the hospital; the industry, cheerfulness, and spirit of contentment

which are everywhere apparent, and the absence of all complaints of ill-treatment or neglect of any kind, as well as the universal feeling of confidence and respect evinced for both officers and nurses, are some of the fruits of this system which we would not willingly forego." The percentage of recoveries is about 40; that of deaths 7, a rate partly due to the grippe and to an unusual influx of aged and decrepit patients. As to the suggestion of the disbelievers in this system, that "restraint by drugs" is practised, the physicians of the hospital declare that it is less resorted to than formerly. As the Treasurer's statement shows only $900 expended for "medical supplies and instruments," or less than ninety cents a year *per caput*, the use of drugs must be extremely limited. Altogether, these reports are extremely suggestive, and as we are all prone to doubt whether any good thing can come out of Nazareth, it is really an act of justice to direct the attention of our readers to this remarkable record of progress.

—A work of special value to bibliographers and librarians, and involving an immense amount of scholarly research, is Dr. Gottlieb's volume 'Über Mittelalterliche Bibliotheken' (Leipzig: Harrassowitz. 1890. 8vo, pp. 520). It consists of a series of papers in which the author has collected and presented in available form all accessible and authentic information concerning the character and contents of mediæval libraries, of which he publishes or summarizes more than fourteen hundred catalogues, many of them derived from manuscript sources and here printed for the first time. His account of the formation and growth of libraries before the invention of printing, and of the manner in which this work was carried on by monks and princes, is an interesting contribution to the history of culture as well as to bibliothecal science. The efficiency of cloisters in preserving the remains of classical literature has been greatly overestimated. Long before the close of the middle ages, monastic institutions had ceased to be seats of learning, and naturally took no care of the manuscript treasures which had been confided to their keeping. Many abbots, as, for example, Conrad and Rumo of St. Gall, towards the end of the thirteenth century, could neither read nor write. In 1440 the works of Propertius were discovered in a cloister—not, however, in the library, but in the cellar, where they served to support a cask of wine. And we learn from contemporary descriptions into what utter neglect even the library of the famous Monte Cassino had fallen at this time. For critical editions of classic authors, the genealogy of the manuscripts in which they have been transmitted to us is a matter of first importance. It is impossible to determine the worth of a manuscript unless we can trace its history and know its origin; and it is only by learned and laborious investigations, such as Dr. Gottlieb has undertaken and prosecuted with so untiring industry and conscientious care, that satisfactory results of this kind can be obtained.

NICOLAY AND HAY'S LINCOLN.—I.

Abraham Lincoln: A History. By John G. Nicolay and John Hay. 10 vols. 8vo. New York: The Century Co.

THE Lincoln biography, which was so long followed with great interest by the multitudinous readers of the *Century*, is nearly doubled in size in the book form. The greatest increase is in the chapters on the military history of the war, most of which were omitted in the serial publication. In the treatment of political subjects also we find considerable new matter. The ten stout and handsome volumes certainly contain one of the most notable literary works of our generation. The authors, who were intimately associated as private secretaries of President Lincoln, have continued their partnership in labors which began in the Executive Mansion; and as Mr. Lincoln was the object of their loyal personal devotion while he lived, his memory and his history have been the centre of their joint activity during the quarter of a century that has passed since he died. They have continued, by voluntary self-devotion, through all the active part of a lifetime, the private secretaryship which they shared during the great war period. The world has seen other literary partnerships, but this is unique, not only in the extent and importance of the work, but in the affectionate dedication of two lives to the building up of a noble memorial to their dead chief.

To none could the memory of Lincoln more naturally become a cult than to the two young men who stood in a peculiar way between him and the public during the overwhelming events of his Presidency, and who were often the confidants of his most private thoughts and the instruments of his personal purposes. They would have been his literary executors by force of circumstances, if he had not indicated them by any expressed wish of his own. We have now the fruits of many years of labor—the completion of the task they assigned themselves as they followed him to the grave. They have, in another way, rivalled the widow of Mausolus in the lavish bestowal of wealth and of labor upon a monument.

It is not hard to see how their work shaped itself into 'A History' instead of a biography. Lincoln's Presidency was the culmination of an historical epoch. His election was the last civil struggle between negro slavery and the nineteenth century. He became the commander-in-chief in the war to which the Slave Power appealed when it was defeated on the field of politics, and he died in the moment of his victory over it. His life was an important part of history during the last four years of it, and he had become prominent in the political arena from the time of his notable debate with Douglas a couple of years before. It was natural, therefore, that his biographers should broaden their plan to include an historical treatment of public affairs, at least from the formation of the Republican party and the struggle over the organization of Kansas and Nebraska as States. In a similar way they no doubt found themselves impelled to attempt something more than a sketch of the military history of the civil war. The early campaigns of the Army of the Potomac were so directly under the eye of the Government at Washington, and Mr. Lincoln was himself so responsible a factor in them, that there was no little difficulty in drawing the line between a narrative of what was personal to him and what more properly belonged to technical military history. When a full history of events on that theatre of war was decided upon, many reasons besides the literary sense of proportion would urge them to treat the campaigns of other armies with approximate completeness. The choice really lay between a rigid restriction to matter strictly personal to him, with a careful editing of his papers and correspondence, and a history of the time, with Lincoln as the central figure.

When the choice of what may, in no bad sense, be called the more ambitious plan was made, the difficulties were by no means over. Numerous subjects would demand attention, each of which might well fill volumes. The work would widen as it went on, and the inevitable result was that gaps must be left from sheer inability to do everything. The most notable example of this is the Congressional and legislative history of the war. The composition of parties after the secession of the Southern Senators and Representatives, the analysis of the elements of the Union party, as it was called, the relative strength of its different wings and the personnel of the leading men, the attitude of these towards the President and his Cabinet, the growth and consolidation of party elements, the progress of public opinion as the war went on, and its effect upon Congress and upon the Administration—all these things are so lightly touched, if touched at all, that the legislative history of the war must be said to be practically omitted. The same is true of its financial history. We see Mr. Chase prominent in the general councils of the Government, and his personal relations to the President are not neglected, but the great work done in the Treasury Department is only vaguely sketched. Yet, even as it is, the work is so voluminous that one doubts whether the personality of Mr. Lincoln is not partly lost or obscured by the extent of the picture and the crowds of events and persons which fill it. On so vast a canvas, with so many figures, and each painted rather large, the dominance even of the chief can hardly be maintained without exaggeration.

The authors seem to have felt this difficulty, and to have tried to overcome it by constantly pointing out how, in their judgment, Mr. Lincoln's hand was upon the springs of every movement, and that all the actors in the great drama were strictly subordinate to him, in intellect, in will, and in purpose, as they were in the official hierarchy of the Government. Herein lies, we think, the unsatisfying element of the book. Those who cherish most reverently the memory of Mr. Lincoln, and who unhesitatingly accord him the first place among the great men of the war period, generally recognize the fact that the President was still only first among his peers, and that there was no great gulf between him and his lieutenants such as in ancient legend separated the hero from common mortals. The realism of the present day is in no small part a protest against illusions. To paint an historic character as ideal is held in itself to be proof that the portraiture is not real. Limitations, weaknesses, and errors in judgment as in action, are so universal traits of human nature that their absence is looked upon as a mark of unreality—we would say of fiction, had not the general tendency to realism so thoroughly invaded fiction that fiction is likely to become a protest against all that is ideal instead of being its refuge. The thoughtful reader finds it impossible to conclude that even Mr. Lincoln was always right in judgment and right in action. He cannot assent to the theory that the administration of the Government from March, 1861, to April, 1865, was the best conceivable. He is conscious of internal protest when asked to assume that whenever Congress differed from the President, Congress was wrong, or that such difference on the part of the Cabinet, collectively or individually, was a necessary proof of unwisdom.

The tone and key which will suit the fervor of a brief eulogy will not adapt itself to a history upon a large plan. It is here, we think, that the authors have found their problem practically insoluble. The history suffers by the necessity of making the personality of one man dominant throughout the whole, and the biography suffers from the inexorable "logic of events," which will not brook the conclu-

sion that but one wise and able man lived in so great an epoch. We are made conscious of a certain strain upon our appreciation of the man, from the beginning of his public career. Lincoln's manly protest against the extreme pro-slavery resolutions of the Illinois Legislature in 1837 is weakened by the authors' comment that the right was "reason enough for the Lincolns and the Luthers." Lincoln was no Luther—least of all a Luther in the anti-slavery cause; and the juxtaposition of this characterization with that of Garrison, "the boldest and most aggressive non-resistant that ever lived," one "taking no account of the expedient or the possible," and of Lovejoy, who is described as "a predestined martyr," gives the incongruity a too sharp accentuation (vol. i., pp. 147–151). The high key thus taken in the first volume continues to the tenth. When the narrative reaches Mr. Lincoln's suggestion to his Cabinet in February, 1865, that they should propose to Congress the offer of four hundred millions to the Southern States as a compensation for the slaves, on the condition of immediate surrender and emancipation, the unanimous dissent from the policy of such a proposal is said to prove "it turned out that he was more humane and liberal than his constitutional advisers" (vol. x., p. 135). Mr. Lincoln would have been the last to give it this interpretation. Even so much of the Cabinet discussion as the authors report, shows that perfectly legitimate considerations of public policy and probable effect were the motives by which both they and he were influenced, and no question of personal humanity or liberality was involved.

When our authors give us their general estimate of Mr. Lincoln's character, and try to put the finger upon the trait which most distinctly marks his mental peculiarity as a statesman, they have done it very happily in saying that he was a great opportunist before the word "opportunism" had been invented. This means that he was ready at all times to secure what for the moment seemed the best thing attainable. It means that he set great store by the practical, even at the risk of seeming to neglect the theoretic. It means a devotion to the general good to the extent of willingness to sacrifice particular and subordinate advantages for its sake. When joined with a devoted patriotism, it is still consistent with seeming to go slow in pushing reforms until he sees that the time is fully ripe for them. It will almost inevitably appear laggard to those most ardent for progress, and will in fact be full of caution and conservatism even when most strongly committed to a great purpose. To such a nature, if backed by clear insight and sagacity in judging men and events, there will, of course, come many a fork in the road when the reasons for going to right or to left are so nearly balanced that either path may be taken without sacrifice of principle. A more positive and ardent character might scorn or condemn every route but a straight line; but this one will be quite indifferent to seeming deviations, if he thinks he may thus reach his end most safely and surely. Even when the end is reached, such a one will be ready to admit that there might have been a shorter and directer way, but may fairly waive the discussion in the satisfaction that the goal is won.

We think the popular judgment of Mr. Lincoln is based upon an instinctive appreciation of these traits in his character. He meant to restore the Union and national supremacy, and never faltered in the purpose till it was accomplished. To this all else was subordinated. It is not necessary to argue that he was wiser in diplomacy than Seward, that he was more unselfish and of broader patriotism than Chase, that he was a better anti-slavery man than Blair. In this respect not only are comparisons odious according to the proverb, they are also unnecessary and unwise. What Lincoln accomplished is enough. How he did it, to the minutest detail, will always be matter of fascinating study to all who find interest in human affairs, and we have good old authority for saying this will include all who are really human.

It is necessary to remember that Mr. Lincoln was by nature conservative. He saw clearly that every question of reform had two sides, and the peculiar clearness of his intellect within its range made him appreciate so fully the objections even to his chosen course, that he often seemed undecided when he was only showing that he understood the cost of his decision. He was apt to be impatient (as far as he ever was impatient) with those who were for driving on without, as he thought, recognizing the difficulties in their way. This temperament made him seem slow even to those with whom he had in his own mind agreed. His whole life warrants us in assuming that he was naturally distrustful of men who were regarded as radicals. He began public life with great reverence for such leaders as Henry Clay. He came to the Presidency with a similar respect for such statesmen as John J. Crittenden. He no doubt had a real distrust of himself when he found himself at the head of affairs, with several States declaring themselves, as to us, foreign nations. He shrank from being responsible for any act which would be the beginning of war, and was willing to go to the verge of safety for the sake of preventing an armed conflict. This made him seem hesitating or lukewarm to more ardent men who did not share his responsibilities, and was the beginning of a misunderstanding between him and leaders in Congress which was never wholly removed. It does not matter whether he or they were more nearly right, he had to work out his results according to the laws of his own nature, or become merely a follower of some one else. He was too genuine a character and altogether too much of a man for this last; yet his sincere modesty made him feel his way towards confidence in himself and his own conclusions by hesitating steps. Through the first year of his administration, and to a certain degree through the whole of it, he seems to be wistfully peering into the future with no full assurance as to any step he took; but still he took step after step as one who feels the ground quaking and uncertain under him, but is still resolute to go on. We may think he could have gone more rapidly or more confidently, without detracting at all from the sympathy and admiration for his character as our providential leader. As he measured his thoughts with other men's, he evidently gained faith in himself. As he tested his courage by theirs in great crises of peril, he learned that he was no more dismayed than they. He found his resources as much at command as theirs, and his judgments as often proved right by the event. He thus grew into a statesman and a leader—in his own way and with his own peculiar traits and qualities—but a leader, nevertheless, recognized by the nation and by the world as such when he died.

LOCKYER'S METEORITIC HYPOTHESIS.

The Meteoritic Hypothesis: A Statement of the Results of a Spectroscopic Inquiry into the Origin of Cosmical Systems. By J. Norman Lockyer, F.R.S. Macmillan & Co.

THE title of this latest book of Mr. Lockyer's does it scant justice. An inquiry into the origin of cosmical systems based entirely on spectroscopic evidence would be as futile an undertaking as one could well engage in, and if there is in the book any special inquiry into the origin of nebulæ, suns, or planets, we have failed to notice it. An order of progress in the evolution of such bodies is, indeed, implied, but the main purpose—we might say the whole purpose—of the book is to propound a new theory of the constitution of all self-luminous celestial bodies, as they now exist. The new "meteoritic hypothesis" is that all such bodies as the aurora, the zodiacal light, comets, nebulæ, and stars are composed either of swarms of meteorites or of masses of meteoritic vapor produced by heat. And a meteorite is simply a mass of matter whose weight may be estimated by milligrammes or by tons, moving through the celestial spaces. If this were all, the hypothesis would amount to little more than that all the celestial bodies are made up of pieces. But the kernel of the theory is that these supposed meteorites are hard bodies in rapid motion, which generate heat and vapor and, to use a familiar term, strike fire by their mutual collisions. Were the meteorites which make up a celestial body but few in number, the light thus emitted would appear only as a succession of flashes, no one of which would be visible even in the most powerful telescope. Actually, however, the number of meteorites in the faintest comet are to be counted by billions of millions, and the collisions among them may number millions in a second, thus giving to the flashes the appearance of a continuous light, bright enough to be seen at a distance of millions of miles.

The architectural plan on which Mr. Lockyer erects his structure eaves nothing to be desired. He builds, step by step, from the earth upwards, taking the same pains to prove things that no competent authority has denied for twenty years (the cosmical origin of meteoric masses, for example) that he does to prove what no one will admit. The falling of meteorites on the earth, the phenomena of shooting-stars, the aurora, the zodiacal light, comets, meteor swarms, and nebulæ are all reviewed in logical order. As a record of facts and references on every branch of celestial spectroscopy, if in no other way, the work may be of value both to the investigator and student. The suspicion that one might entertain of facts opposed to his theory being ignored, is materially allayed by the consideration that the author has unlimited confidence in his ability to explain all such facts away.

The hypothesis has, in its purpose, at least, one great merit. If proved, it would simplify the theory of the constitution of most of the heavenly bodies almost as much as the discovery of gravitation simplified the theory of their motions. If all the mysterious and hitherto inexplicable phenomena of comets, nebulæ, and auroras are results of something so familiar to us as the sparks of light which accompany the blows of flint and steel, then indeed we have a discovery of the first order. But we fail to see that Mr. Lockyer adduces any sound evidence in favor of his view that has not been familiar for twenty years, and this evidence only shows that the orbits of comets and meteoric streams are closely related. The very first step in the proof is not only wholly wanting, but left quite out of consideration. The only possible way in which the spectroscope can show that the light of a heavenly body arises from the collision of hard masses is through making known some resemblance between the spectra of the light from

the body and from such collisions. Now, we do not know that any one has ever systematically examined the spectra produced by collisions, and Mr. Lockyer says nothing on the subject, so that one term of his comparison is non-existent. He does not try to prove his thesis by comparing the two sources of light which he holds to be identical, but by comparing the spectra of different orders of celestial bodies with each other. He labors hard to show that the spectra of comets, auroras, nebulæ, and the zodiacal light all have certain distinctive features in common, and hence concludes that they arise from collisions. This form, bad as it is, is the only logical one to which we are able to reduce the reasoning.

But even when we leave this fatal defect out of consideration, it seems to us that Mr. Lockyer signally fails to show that the numerous spectra which he tries to interpret have in common any features which do not belong to all spectra. His efforts to prove that two things wholly unlike on the face of them are really very much alike, remind one of the efforts of the "Baconians" to show that the underlying ideas of the works of Shakspere and Bacon are identical. Indeed, Mr. Lockyer has the harder task of the two, inasmuch as differences of spectra are evident to the eye, while differences of literary style are evident only to the trained intellect. Take, for instance, the spectra of the aurora and of the zodiacal light; the one made up almost wholly of bright lines, the other a continuous band of light without a well-defined bright line in it. The first observer of the latter spectrum, Angstrom, thought he saw a bright line, identical with the principal line of the aurora; but his high northern latitude was extremely unfavorable to his observations, and more fortunate observers have since shown that he was mistaken. But this does not daunt our author in the least. The spectrum of the zodiacal light is very likely variable, and although it was not like that of the aurora when the later observers saw it, it might have been so when Angstrom saw it. Again, the spectra of most comets are as different from both the sharp lines of the aurora and the band of the zodiacal light as any spectrum well could be, being made up almost entirely of "flutings"—broad bands sharp at one edge, but fading off gradually at the other. These flutings are also found in the flame of carbon, so that we here have a well-known resemblance between a comet and a terrestrial flame; but this has no bearing whatever on the meteoritic hypothesis. The fact is, that the spectroscope has so far done little to lead us to solutions of the numerous problems of celestial chemistry to which its use has led. The simple canons of Kirchhoff and Bunsen are true as far as they go, but it was soon found that the same substance would, under different conditions, give very different spectra, and that the changes could not be reduced to any general law. When even the spectrum of so familiar an agent as lightning, where the physical agencies which come into play are fully understood, is one which we should not have anticipated, and can hardly explain to our own satisfaction, how shall we draw any conclusion from the spectrum of a nebula?

It is one of the great merits of Mr. Lockyer's book that one need not go outside of it to see how baseless are its conclusions. The quantitative fallacy, if we may use the expression, is one which runs through the first part of it. This is the fallacy which one should fall into if, hearing of the tens of thousands of ships afloat on the ocean, he should conclude that they must have difficulty in finding sailing-room. In the same way, Mr. Lockyer talks of the upper strata of the atmosphere being "charged with meteoric dust" from the twenty millions of meteorites which daily strike them. A simple calculation will show that if all the meteorites which our planet encountered in ten years were to remain suspended in the air, the most delicate physical test would fail to show their existence. He talks of a meteoritic swarm "ploughing its way through a meteoritic plenum," while he elsewhere quotes calculations which show that in the densest part of this "plenum" the meteoric particles are many miles apart, so that if a person should make the circuit of the sun in the midst of the swarm, the chances would be against his ever coming in sight of a single meteorite.

Our conclusion is, that if the reader of Mr. Lockyer's book would find it either instructive or valuable, he must first eliminate from it all arguments in favor of the meteoritic hypothesis, and remember that all we yet know about the physical constitution of nebulæ can be condensed into a very few sentences. Countless meteoroids, as Professor Newton has called them, are moving through the celestial spaces, but that they are all hard metallic masses we have no reason to believe. Of those which encounter our atmosphere, only one out of a thousand millions ever reaches the earth's surface, and this one is, of course, a very dense mass. What the others are we have, so far, not succeeded in learning. They may be like grains of sand or puffs of vapor or little pieces of the "chaos" of the Greek philosophers. The only circumstance which connects them with comets is that a stream of them is known to move in the orbit of each of two comets; but this affords no sufficient basis for so wide-reaching a theory as the one we have considered.

BOOKS ABOUT THE STAGE.

Curiosities of the American Stage. By Laurence Hutton. Harper & Bros.

The Art of Playwriting: being a practical treatise on the elements of dramatic construction, intended for the playwright, the student, and the dramatic critic. By Alfred Hennequin, Ph.D. Boston: Houghton, Mifflin & Co.

The Othello of Tomasso Salvini, described by Edward Tuckerman Mason. G. P. Putnam's Sons.

Between the Whiffs. By Henry Herman. Bristol, Eng.: J. W. Arrowsmith.

Dramaturges et Romanciers. Par Émile Montégut. Paris: Hachette; New York: F. W. Christern.

Mr. Laurence Hutton writes about the 'Curiosities of the American Stage' with the same fulness of knowledge and with the same loving attention to detail that he wrote about the 'Literary Landmarks of London.' The title of his new book is at once comprehensive and non-committal; it would permit the author to insert almost anything which bore upon the history of the theatre in America. What it does contain is five well-considered essays on "The American Play," the "American Stage Negro," the "American Burlesque," the "Infant Phenomenon in America," and a "Century of American Hamlets." Three of these (including perhaps the most interesting and the most valuable paper of all, that on the origin and development of negro-minstrelsy) appeared originally in *Harper's Magazine*, and reappear here with all their abundant illustrations, each of which has now an unbacked page all to itself. Indeed, no other recent book about the stage, except possibly Mr. Jefferson's 'Autobiography,' has been as admirably or as amply illustrated as this of Mr. Hutton's. No other book certainly has had as careful a list of the portraits it contains, as full an index of persons, or as exact an index of places. These three things are denominated the "Dramatis Personæ," the "Cast of Characters," and the "Synopsis of Scenery" in the "Bill of the Play"—as the author fancifully calls his table of contents: the five chapters also appearing as five "Acts," and the first essay—that on "The American Play"—being broken into sections, here termed "Scenes." Naturally, the preface is called the "Argument," and from this we learn that the author modestly disclaims the critical attitude, and proffers his volume to the "Old Playgoer" and the "Dramatic Collector," two distinct entities not always coupled and inseparable.

Although the author's attitude is not deliberately critical, he collects his many facts and marshals his frequent anecdotes with a full sense of their relative value and importance. Despite his disclaimer, Mr. Hutton is in no wise deficient in what is one of the prime requisites of the true critic—the perception of perspective. Praise and space are here proportioned justly enough, and even the casual reader, while he is amused, will probably pick up a stray hint or two as to the vital principles of the art of the stage. To one of Mr. Hutton's positions we feel bound to take exception. In the most elaborate of his essays, that on the "American Play," in which he considers at length and with a wealth of titles and dates and anecdotes the Indian play, the Revolutionary play, the Frontier play, the play of American character, the New York "local" play, and the so-called "society" drama—in this chapter Mr. Hutton takes occasion to declare that an American play is a play which is American not only in its authorship, but also in its "incidents and scenes and characters" (page 6). There is something to be said for this limitation, no doubt, but a general application of the same principle would force us to maintain that "Hamlet" is not an English play, since its characters and its scenes are Danish, and that "Le Cid" is not a French tragedy, "Wilhelm Tell" not a German drama, and "Aïda" not an Italian opera.

M. Hennequin has a French name, but his 'Art of Playwriting' is subdivided with German minuteness, not to say Teutonic tediousness. He explains the technicalities of the stage with confusing "finickyness"—if the word is permissible; and his explanations are not always accurate. The *wings*, for example, are not "a series of chambers or platforms on each side of the stage" (p. 6); and in three places (p. 45, 87, and 139) he confuses "catch-word," which is a characteristic phrase used by a character more than once, with a "gag," which is an interpolation of the performer; while he nowhere explains the "tag," the concluding lines of a play. We may remark, also, that he has no warrant for calling the entrance of a character on the scene an "enter." These things, of course, are trifles, like the misspelling of *féerie* (p. 49), the attribution of the "Silver King" to Mr. Wills (p. 55), or the accrediting to Scribe alone of the "Bataille de Dames," which M. Legouvé has told us owed but little to Scribe.

Trifles as they are, they seem to indicate a certain carelessness; and, in fact, we discover that with all his multitudinous details, M. Hennequin has no firm grasp on the vital principles of dramatic construction. It is difficult to conceive of the person who can find

his book profitable. A tyro so ignorant of the theatre as to need instruction of this elementary sort had best give up all hope of writing successfully for the stage. Of the mere mechanical processes of the dramatist more can be learned from Mr. Julian Magnus's essay in *Lippincott's Magazine* a year or two ago, or from the very British and rather vulgar book on 'Playwriting,' reprinted from the London *Stage*. Of the more artistic requirements of the dramatist, M. Hennequin reveals no capacity to say anything of value, and the novice can be recommended rather to read certain passages in Mr. Jefferson's 'Autobiography' and of Lewes's 'Actors and Acting,' and to study the advice in the elder Dumas's 'Souvenirs Dramatiques,' in the younger Dumas's prefaces and 'Entr'actes,' in M. Legouvé's 'Souvenirs' and 'Conférences,' and in M. Abraham Dreyfus's lecture on the art of the dramatist.

In his biography of Forrest Mr. Lawrence Barrett likens the actor to a statuary who carves his image in snow; a few days of sunshine, and it is gone for ever. Whatever helps to fix the fleeting image for the judgment of posterity is most welcome. The late Fleeming Jenkin (whose biography Mr. R. L. Stevenson has written with needless condescension) published the notes of Prof. Bell on Mrs. Siddons's *Lady Macbeth;* and Mr. Mason has now attempted a like record of Salvini's *Othello*. Mr. Mason prints the complete text of all the scenes in which *Othello* appears as they are arranged in the Italian version which Salvini acts; gives a diagram of every successive scene, marking the exact positions of every character; and accompanies this with a commentary in which the Italian actor's "reading" and all his "business" are duly recorded with unfailing accuracy. This has been read by Salvini himself, who has added such correction and comment as seemed to him needful. Therefore we have now, as far as may be, an exact record of the way in which one of the greatest Shaksperian parts was performed by one of the greatest actors of our time. This record is most valuable, and for it Mr. Mason deserves the ample thanks of all sincere students of the stage and of Shakspere. Admirable as is George Henry Lewes's criticism of Salvini, it is an æsthetic impression only, and in some ways of less worth than this scientific description. The power and the sweep of Salvini's *Othello* cannot be preserved by mere words, but the means whereby this majesty was attained may, some of them at least, be set down in black and white. It is greatly to be desired that other great Shaksperian performances of our time should be preserved as far as may be in like manner—Mr. Booth's *Iago* for example. Despite the interminable writing about Shakspere, there is still one thing left undone, and this is a history of each play as it has been seen on the stage, with details as to the modifications deemed advisable at each revival.

Mr. Henry Herman is half-author of the "Silver King," one of the best of modern melodramas, and he is the entire author of 'Between the Whiffs,' one of the poorest of theatrical jest-books. Actors have perhaps a broader sense of humor than most of us, and they tell a story better, and have many a good story to tell; but by some strange stroke of ill-fortune no one of these has found a resting-place in this little book of Mr. Herman's. It extends to one hundred and eighty-eight wholly unnecessary pages, and it has a brick red paper cover, depicting a scene at once offensive and impossible.

Reading M. Montégut's 'Dramaturges et Romanciers' is like turning over back numbers of the *Revue des Deux Mondes*—from which distinguished magazine, indeed, these essays are reprinted. And, to borrow a phrase of the day, M. Montégut's criticisms are themselves "back numbers." In 1890, articles on 'Le Roman en 1861,' and on 'Le Roman en 1876,' are curious rather than interesting; and the same may be said of the essay on the plays of the late Théodore Barrière, which seem now sadly old-fashioned. The criticisms of the dramatic work of the late Octave Feuillet, M. Sardou, and the late Emile Augier, are of more value, but, like most French dramatic criticisms—except M. Sarcey's—their point of view is literary rather than theatric; and this is a fatal defect, Charles Lamb to the contrary notwithstanding.

Mungo Park and the Niger. By Joseph Thomson. Dodd, Mead & Co. Illustrated. 8vo, pp. 338.

THE editors of the "Great Explorers" series, of which this is the third volume, have been fortunate both in the choice of a subject and of a biographer; for Mungo Park's tragic career, though short, has an interest equalled by that of few explorers, while to Mr. Thomson's literary skill is added the higher qualification of a wide experience in various parts of Africa, including the Niger. His personal knowledge, therefore, of the difficulties which beset the traveller in savage Africa enabled him to form a just appreciation of Park's extraordinary success, so incommensurate with the means at his disposal. It also lends peculiar weight to his occasional comments, scattered through his narrative, on points connected with the opening up of the continent to commerce and civilization.

In the first chapters he briefly sketches the history of the Niger from the earliest times down to the foundation of the African Association in 1788. During the first three years of the existence of this society, it sent out four expeditions in search of the river, whose existence then was merely known through the accounts of the Arab writers. Though all were unsuccessful and three terminated fatally, Mungo Park, in 1795, offered his services for the same object. He was then twenty-four years old, a Scotchman, whose birthplace, on the Yarrow, was not very far from that of Dr. Livingstone, to whom in many respects he was so like and yet in one important particular so unlike. He started from the west coast with general instructions to trace the course of the river as far as possible, and especially to visit Timbuktu, of whose wealth extravagant ideas were then entertained. In our day a traveller into the interior of Africa requires an army of porters to carry his luggage, but Park had but two, negro servants, all his effects being borne by a single donkey. For the account of this memorable journey, which still remains unexcelled in the annals of African exploration for pure heroism and steadfastness to duty, as well as for its romantic adventures, we must refer our readers to Mr. Thomson's book. After seven months of wandering amid perils innumerable from the lack of food and shelter, from wild beasts, robbers, and especially from the hostile Moorish traders, who naturally looked upon him as a rival, he reached the river alone. One of his servants had deserted him; the other had been made a slave. "I hastened to the brink," says Park, whose account here we prefer to the rhetoric of his biographer, "and, having drank of the water, lifted up my fervent thanks in prayer to the Great Ruler of all things, for having thus far crowned my endeavors with success." Although he was some 2,000 miles from its mouth, the river was "as broad as the Thames at Westminster."

It was a bitter disappointment to the traveller to find, after riding about eighty miles down the stream, that further progress was impossible from the hostility of the people, and he determined to turn back. Before him lay a journey of 1,600 miles, which he must travel alone and on foot, for his horse soon after this failed him, while, to add to his anxieties, the rainy season was at hand. For weeks he struggled on, sometimes being hospitably treated, sometimes being driven from the negro huts at night to find shelter in the forest. On one such occasion, the country being infested with lions, he lay down at the gate of the village, but did not dare to sleep. About midnight the roar of a lion was heard at a little distance. In an agony of apprehension he waited as the beast gradually drew nearer his defenceless prey. "Driven frantic at last by the horror of his situation, he rushed to the gate and madly tugged at it with all the energy of one who struggles for dear life. In vain; his utmost efforts were as little able to move it as were his urgent appeals to touch the hearts of the natives." A little later, however, the gate was opened and he was permitted to enter, the natives being convinced that he was not a Moor, "none of whom ever waited any time outside a village without cursing it and all it contained."

At length his strength was utterly exhausted from hunger, exposure, and repeated attacks of fever, and a wilderness lay before him, intersected by eight rivers, which would be impassable for many months. A slave-trader took pity on the wretched traveller and cared for him during a terrible illness, which kept him hovering between life and death through six dreary weeks. But it was eight months before he could again set out for the coast, this time in a slave caravan under the lead of his benefactor. The caravan numbered about a hundred persons, among whom were "six singing men to lighten with song and antic the toils of the route." In his weakened condition Park could only by the most determined effort of will keep himself from sinking by the way during that terrible march. "The poor slaves," he says, "amidst their own infinitely greater sufferings, would commiserate mine, and frequently of their own accord bring water to quench my thirst, and at night collect branches and leaves to prepare me a bed in the wilderness." And yet, notwithstanding this kindness, and although he saw the slave-trade in all its horrors, even those of the middle passage (for a part of his return voyage was made on an American slave-ship), he has not a single word of condemnation for this traffic, and even indirectly upholds it! Various explanations have been made of this strange attitude of a deeply religious and humane man towards what is now recognized as "the open sore of the world." Possibly his intense feelings of gratitude to the slave-trader Karfa, as well as the general indifference of his time, when the anti-slavery agitation had but just begun, will sufficiently account for it.

Park reached England at the end of 1797, where he was received as one raised from the dead, having been absent two years and nine months. Shortly after this he married and settled down to the practice of medicine at Peebles. But while the mystery of the Niger remained unsolved, he could not rest content in Scotland. In 1805 he was again in Africa, at the head of an expedition consisting of some fif-

ty or more men, all but three or four of whom were whites. It was unfortunate from the beginning, for it started "at the worst possible time of the year, and with the worst possible selection of men." He succeeded in reaching the Niger after superhuman exertions on his part, but only four of the Europeans were with him; the rest had perished by the way. Here his native guide left him on the point of embarking on the river "with the fixed resolution to discover the termination of the Niger, or perish in the attempt." For a thousand miles he sailed safely down the stream, but, when almost within sight of his goal, Park and his companions were drowned while defending themselves against the attack of the natives who were attempting to prevent his further progress. For years his fate remained unknown, and although at length authentic tidings of his death were received at the coast, his family refused to believe that he was not alive. So late as 1827 his son Thomas lost his life in a mad attempt to penetrate into the interior to search for his father.

With this tragedy the main interest of Mr. Thomson's book ceases. The remaining chapters are devoted to necessarily brief accounts of the explorations of Clapperton, the Landers, the French traveller Caillié (not Caillé, as Mr. Thomson persistently spells it), and of his own recent journey in the interests of the Royal Niger Company. It is to be regretted that he has neglected to mention the work of that remarkable African, Bishop Crowther, whose contributions to our knowledge of the geography of the Niger were publicly recognized in 1880 by the Royal Geographical Society. He condemns with righteous indignation the gin trade, which, singularly enough, began about the time of the decline of the slave trade. His well-known views in respect to the civilizing influence of Mohammedanism on the negro are also again stated with much force. Although to one familiar with Park's simple narrative, Mr. Thomson's style seems at times diffuse and rhetorical, his book is of unusual interest and value, not only as a biography, but as a history of one important part of the exploration of Africa. The illustrations are fair, some of them being apparently reproduced from those in the early editions of Park's travels; but we miss the one familiar to our childhood representing Park as driving the frogs from a pool that his horse may drink. There is an excellent index, and several maps showing the various views of the geographers as to the course of the Niger, as well as Park's routes.

Essays in English Literature, 1780-1860. By George Saintsbury. London: Percival & Co. 1890.

Mr. Saintsbury includes in this volume thirteen of the minor authors of the first part of the century, and to give an impression of the work they must be named. They are Crabbe, Hogg, Sydney Smith, Jeffrey, Hazlitt, Moore, Hunt, Peacock, Wilson, De Quincey, Lockhart, Praed, and Borrow. Most of these are out of vogue now, and the principal use of this book is to relieve the reader from the perusal of much dead literature which it is, nevertheless, well to know something about. The best of these essays we have commented upon from time to time as they appeared in magazines. They are all written after a faithful reading of the authors, many of them with spirit and some with an enthusiasm of appreciation which, however, the critic carefully keeps out of his style.

Mr. Saintsbury prefaces the whole with a brief paper on the kinds of criticism, in which he declares his preferences, insists that knowledge of other literature is a necessary qualification of a critic, and praises the comparative method. He protests, also, against the tendency to biographical and impressionist criticism, and calls for a return to the criticism based on fixed principles of taste. All this is in the right direction. His own writing, however, is overburdened with trivialities of fact, and is tedious in its fulness of talk about the subject. He does not present the individuality of the author's genius, his traits, with much body or grace; and in particular he is continually offending by looking over his shoulder at an imaginary somebody who "will say" so and so about the critic's present sentence. One cannot help noting, also, that though aware that these are minor authors and acknowledging it, he usually contrives to insert some judgment which declares the author under examination very remarkable indeed. Thus, he says that Hazlitt "was the greatest critic that England has yet produced," and that Sydney Smith, "for goodness as well as for cleverness, for sound practical wisdom as well as for fantastic verbal wit, has had hardly a superior and very few equals." Similar passages could be quoted from other essays. His account of Peacock, his defence of Lockhart, and his paper on Borrow seem to us excellent, and may be read with profit by any literary student; but it must be acknowledged that Mr. Saintsbury's style is uninteresting, his matter second-rate, and his idiosyncrasies (which are Toryish of a very old-fashioned kind) trying. Neither is his English so pure as should belong to a professional wide reader of the best English as it has been used by great and small writers.

An Introduction to Social Philosophy. By John S. Mackenzie. Macmillan & Co. 1890.

It seems indisputable to the ordinary mind that, if human society is to be made over, there should be some determination of its ideal end; for otherwise, as Aristotle says, we should be like archers without a mark, rather unlikely to attain the needful. Yet most of the social reformers who now flourish are so eager to get at work that they are disposed to omit this indispensable preliminary, and thus discourage intelligent people from following them. It is the merit of Mr. Mackenzie that he recognizes the illogical character of this procedure, and endeavors to throw upon the future of mankind some light from the lamp of philosophy. In this attempt he displays considerable dialectical power, and his treatise is distinguished by lucid and methodical statement. His claim is, moreover, a very modest one, for he declares that philosophy can offer no certain conclusions (for if it did they would be necessarily wrong), and it can never have any results which are not subject to modification by a deeper insight.

"It would appear as if we must either grant that there is no philosophy worthy of the name at all, or else hold that philosophy is nothing more than a vague effort after system, and not in any sense the attainment of it—which, again, would only be another way of granting that there is no philosophy worthy of the name. But the solution of this difficulty is to be found in the consideration of the nature of an ideal. The possession of an ideal may be said to lie midway between the attainment of an end and the mere struggle towards it. In guiding ourselves by an ideal, we are struggling towards an end to which we already possess with more or less completeness the conditions of attainment. Such an ideal is not in the full sense knowledge; but it is a kind of prophetic insight which, for a developing being like man, is as good as knowledge—or, in a sense, even better."

Philosophy, therefore, is the effort to attain clear insight into the meaning of our conceptions, guided by the ideal of knowledge as a completed system. It is higher than science, yet depends upon it—to use Hegel's illustration—as eating depends upon food. All philosophies prove inadequate, and yet through them philosophy gradually takes shape. We must remain unscientific, depending upon a kind of faith—the faith that things have a meaning, that the world is a rational system. Social philosophy, or the metaphysic of social life, is possible, because the structure of society must be regarded as logically prior to the existence of any human being. It comprehends ethics and politics, and has a useful part to play in regulating these subjects. It must "guard against the danger of confounding history with prophecy—of supposing that that which has been is necessarily that which will be, or at any rate that when we have investigated past conditions, we are in possession of a complete clue to the future."

As we cannot here discuss the limits of science and metaphysics, we shall confine our criticism to a statement of what is involved in Mr. Mackenzie's position. He assumes not only that things have a meaning, but also that we can find out what it is. He rejects the view, not that past conditions furnish us a *complete* clue to the future (which no one holds), but that they furnish the only clue. The only basis of science is the uniformity of nature—including man's nature. But Mr. Mackenzie holds that prophetic insight is a further basis of philosophy; that we may divine the future independently of our experience of the past. Now, even if we admit the existence of prophets and prophetic insight in this sense, it is evident that we must have some criterion of their insight before we are in position to determine whether they are true prophets or false. Not every one that says Lo here! or Lo there! is to be followed. This criterion corresponds with verification in science, but we do not observe that Mr. Mackenzie supplies it. The analogy that he refers to between prophetic insight and the scientific imagination is misleading on this account, for the latter is mere dreaming unless tested by verification; while the only verification applicable to the former is to wait until it is fulfilled.

However this may be, Mr. Mackenzie proposes to make a practical use of his philosophy in solving the social problem, which is "to raise up the humble and teach the victorious how to use their power." Society has become plastic and disintegrated, and organic filaments are only beginning to form. "Men were first exploited by men; then they were exploited by things; the problem now is to combine men together so that they may exploit things." Democracy is the culmination of the integrating process. "The possibility of a democratic government is consequently one of the inspiring elements in our present social condition, opening up an almost infinite prospect of improvement in the organization of industry and of life in general. Democracy is, in fact, the ideal form of government for a perfect fluid, as aristocracy is for a solid; and the more our society tends to liquefy, the more entirely does democracy become at once possible and necessary."

The deliberative function in democracy is foreshadowed by the "numerous voluntary associations for social ends which are everywhere growing up," among which Mr. Mackenzie includes the Knights of Labor in America. We apprehend that the social ends of this body are such that his prophetic insight will not gain credit in this country from the

remark—"It seems difficult to over-estimate the good that may be done by such associations as are here referred to, as means for the diffusion of that light and culture which are required to temper our democracy." But we will do Mr. Mackenzie the justice to say that he is not always so unfortunate in his prophecies, and we find many of his observations acute and suggestive. It is not very strong or profound thinking that he does, but it is careful, and those who consider a philosophy of society as attainable will be interested in Mr. McKenzie's ideal. He has read widely, but with the rather annoying result that he finds it hard to express himself except in the language of others. There is scarce a paragraph in his book that does not contain at least one phrase or sentence in quotation marks, and many paragraphs are fairly peppered with inverted commas.

U. S.: An Index to the United States of America, historical, geographical, and political; a Hand-book of Reference, combining the "Curios" in U. S. History. Compiled by Malcolm Townsend. Boston: D. Lothrop Co.

WHILE the making of scrap-books is an interesting and commendable pursuit, the publishing of them generally results in a production of little value to any one except the compiler. This is principally because everything which comes into the net of the scrap-book-maker is treated as good fish, so that, while part of the catch has more or less value, much of it has none. In such collections, along with facts as undisputed as the rise of the tide, one frequently finds other "facts" whose sole source is the inventive faculty of some reckless or facetious journalist. We mention these characteristics of this class of books because 'U. S.,' if no better in plan than many others, is much better in execution. Though we do not altogether approve the selection of facts to be presented nor their arrangement when chosen, the compiler deserves the great (because unusual) credit of having, in most cases, verified their correctness. He is careful to tell the reader, for instance, that the Declaration of Independence was *not* signed on the Fourth of July; that Maine was not so named in honor of the wife of Charles I., as commonly asserted, because, at the time the name was first used, there was no prospect of his marrying a French Princess.

The book is rich in appropriate maps and illustrations—the former hideous to the eye from the coarse drawing and coloring—and in documents. In addition to the text of the Constitution and the Declaration, which are always found in similar works, we have the Confederate Constitution, with a joint index to both papers, very useful for purposes of comparison, and many other reprints. Space fails us to describe the remaining contents, which include a great variety of statistical and other information, some useful, as the history of geographical names and terms, elections and Cabinets, coins, etc., and some that is trivial. We have noticed but few loose statements, though that "In February, 1866, slavery was abolished for ever by act of Congress" must be classed as such, as well as the assertion that Mugwumps were exclusively those "who favored the Democratic candidate for the reason that a change in administration was necessary, as 24 years was long enough for a party to be in power." Of positive misstatements we have observed only one, that Pickering was appointed Postmaster-General from Massachusetts.

Owing partly to its unalphabetical arrangement and to the inadequacy of the index, the book will be less useful, though perhaps more amusing, than better arranged publications, such as Brown's 'Dictionary of American Politics.' In the index, which is well made as far as it goes, we notice an odd error, by which certain attributes of the Presidents in general are attributed to one of them.

Le Opere Italiane di Giordano Bruno ristampate di Paolo de Lagarde. 2 vols. Göttingen. New York: G. E. Stechert. 2 vols. Pp. 800. 8vo.

THE Italian works of Bruno have hitherto been accessible only in the collective edition of Wagner (Leipzig, 1830). The original editions are so excessively rare that a complete set of them is hardly to be found in any one library. Several of them were printed at places—not always, it would seem, those named on the title-page—where type-setters and proof-readers skilled in Italian were scarcely to be had, and Prof. Lagarde gives reasons for thinking that the 'Candelaio' is the only one of them which Bruno himself can have corrected. Under these circumstances it is not surprising that errors of the types, anomalies of spelling, punctuation, and the like, are very numerous, even judged by sixteenth-century standards. The question of an editor's duty in such a case is one of some difficulty. Wagner took a liberal view of his functions, and undertook not only the correction of obviously accidental faults, but a far-reaching modernization of the language of Bruno. That in this he was not uniformly consistent or successful, cannot be wondered at. His procedure has been sharply criticised by Imbriani and others, who have also shown that, apart from intentional changes, the accuracy of Wagner's reprint leaves much to be desired. Numerous examples of omissions of words and clauses, departures from the reading of the original, and erroneous emendations are given by Professor Lagarde (p. 771 *seq.*). The reader can enlarge the list to any extent that he thinks worth while. For instance, in the sentence (Wagner ii. 301, l. 41=Lagarde, 611, l. 6), "la nostra simplice libertà et l'altrui maliciose regole, censure, et institutione," the word *libertà* is omitted, and the sense wholly destroyed. It is not ungrateful depreciation of the work to which we are indebted for whatever knowledge we have of Bruno's Italian writings, to say that Wagner's edition does not at all meet the need of the present-day student. Besides, it is out of print and scarce.

A new edition was therefore a desideratum, and this one is doubly welcome because Prof. Lagarde has done just what his predecessor did not. With an accuracy for which his name is a guarantee, he has reprinted the original editions just as they left the press. Palpable misprints are corrected, but even in this case the original reading is given at the foot of the page. For the student of the Italian language this must be a great gain. The editor points out a number of interesting peculiarities of inflection, which Wagner's modernization consistently effaced, such as the forms *hauessiuo*, *fussiuo*, *harestiuo*, in a single line (53, l. 18), and the third persons in *-eno*, *e. g.*, *discorreno=discurrunt*, etc.

The external form of the edition is worthy of the pains which have been taken to secure the correctness of the text. For the convenience of scholars in citing the edition, the pagination runs through the two volumes, and every fifth line is numbered on the inner margin, so that any line can be referred to by a simple formula, say 100_{10}. A full index of names of persons and places is added. As an appendix, is reprinted a notice of the edition by the editor which originally appeared in the *Göttingische gelehrte Anzeigen*, February 1, 1889. In it Prof. Lagarde has given the impressions of Bruno which he has formed in the long and minute study of these writings. His estimate of the man differs materially from the two ready-made opinions between which the world now seems to be divided. It will doubtless be unacceptable to those who cannot bear to hear Bruno spoken of except in the language of indiscriminate eulogy. Nevertheless, it was a singularly unfortunate mistake of a reviewer in the *Academy*, who could think of no better way of accounting for Prof. Lagarde's judgment than by ascribing it to the prejudice of a Roman Catholic of the common type, and who, being corrected, fell into the almost more surprising error of making Lagarde a Protestant of the common type. Whether we wholly agree with the estimate or not, we must recognize in it a contribution toward a juster appreciation of the Nolan philosopher by a scholar who, like all men of strong individuality, has fixed opinions—prejudices, if you please—enough of his own, but who is singularly free from the worship of the idols of the tribe or the market-place. And does he not hit very near the mark when he points out, as the defect of Bruno's philosophy, that he attempted to solve philosophical problems with an astronomical key?

The interest in Bruno's Italian writings is, however, not exclusively in this philosophy, to get at which through its hard shell requires some perseverance. The picture of the men and manners of Elizabeth's England in the 'Cena de le Ceneri' is not flattering, but it is very entertaining. 'Gli Heroici Furori' is a panegyric of ideal love, in a tone befitting its dedication to Sir Philip Sidney; while the 'Candelaio' is a piece of realism which, in subject and execution, must delight our newest school. Has any one ever investigated its relation to Ben Jonson's "Alchemist"? But, after all, Bruno is not for many; and Prof. Lagarde very frankly says that he has had students more in mind than readers in preparing his edition. Some day, it is to be hoped, we shall have, in addition to this critical edition of the text, a commentary such as the text requires. Prof. Lagarde is his own publisher, which perhaps accounts for the fact that his Bruno has received but little notice.

BOOKS OF THE WEEK.

Abbott, Mary. The Beverleys. Chicago: A. C. McClurg & Co. $1.25.

Seashore Lands.

ON THE MAINE COAST AND OTHER PARTS OF THE NEW ENGLAND SHORE. Having made a specialty of these lands for over ten years, I act as agent for purchase and sale. A number of beautiful shore, island, and peninsula properties on Penobscot Bay, on the "Camden Shore," at "Islesboro," the Fox Islands, and the other principal points now being rapidly developed. These lands generally range in acreage from parcels of 10 acres to 300 acres, have beautiful rocks, trees, beaches, and harbors, and comprise some of the few remaining tracts now purchasable at prices approximating farm values, and offer variously some of the best opportunities for gentlemen wishing independent estates for summer occupancy or for investment. For details, circulars, photographs, and particulars address

J. Murray Howe, 27 School St., Boston, Mass.

Coast of Maine.

CAPE ROSIER.

The lands of the "Cape Rosier Associates" on Penobscot Bay, 50 miles nearer Boston and the West than Bar Harbor, Mt. Desert, are offered for sale in parcels of five and ten acres and upwards. These lands comprise over ten miles of almost continuous shore-frontage in one of the boldest and most beautiful sections on the coast, twelve hours' journey from Boston. They front upon fine harbors, have beautiful rocky shores, beaches, woods, and mountain views. The drives along the shores and among the hills are very varied and beautiful. New wharves have been built, and new connections with daily trains and steamboats established. In these lands is offered an exceptional opportunity to purchase for very small sums fine and perfectly protected seashore estates. The lands will not be sold for speculation or in small lots.

ALFRED BOWDITCH, HENRY PARKMAN, J. MURRAY HOWE, } Trustees,
27 School Street, Boston, Mass.

HAVE YOU A COPY?

Mr. Henry G. Taylor, Newtown, writes us: "That is a wonderfully useful little book—

Books of the Bible Analyzed,

you are offering to the world. I hope you are selling it by the myriad."

The Nation.

NEW YORK, THURSDAY, JANUARY 8, 1891.

The Week.

THE war with Great Britain which was declared by one of our morning contemporaries on Monday, and the news of which, when cabled to London, caused much consternation there, has come to a sudden end. The British Foreign Office authorizes the statement that there is no such war, and now the President sends to Congress the latest correspondence with Great Britain on the Bering Sea question, and all of it up to January 5, 1891. It consists of only two despatches, one from Lord Salisbury, dated August 2, 1890, and a reply from Mr. Blaine, dated December 17. The text of Lord Salisbury's communication occupies fifteen printed pages. Mr. Blaine's fills thirty-seven. If the strength were in proportion to length, Mr. Blaine's paper would be two and one-half times more powerful than the one he replies to. Its repellent force will be found to be even greater than that by those who attempt to comprehend it at one sitting. But it has one great merit in that it formally abandons the *mare-clausum* doctrine as applied to Bering Sea, and substitutes for it some general considerations respecting the preservation of the fur seal from extermination which were laid down by Minister Phelps on the 12th of September, 1888. In other words, Mr. Blaine has got back to the place of beginning. He has boxed the compass, and is now ready to take up the subject where Mr. Bayard left off. He now says: "The repeated assertions that the Government of the United States demands that Bering Sea be pronounced *mare clausum* are without foundation. The Government has never claimed it and never desired it. It expressly disavows it."

"What has the long-winded controversy been about, then?" the public may ask. Reference to Mr. Blaine's letter of June 30, last year, supplies a sort of answer to this query. It would seem that he draws a distinction between *mare clausum* and the alleged right of exclusive jurisdiction over a space of one hundred miles from any coast or island belonging to us, this distance being fixed in the ukase of Alexander I. of Russia dated September 4, 1821. Mr. Blaine is well aware that international law knows nothing of the Emperor Alexander's ukase or of any local regulations touching the high seas, and that it prescribes one marine league as the limit of territorial waters which are not strictly *mare clausum*. So he seeks an *argumentum ad hominem* against Lord Salisbury by citing a British statute which forbade a vessel "hovering" within eight leagues of the island of St. Helena while Napoleon Bonaparte was confined as a prisoner there. What would have happened if any vessel not British had been caught "hovering" in that place would have been something like this: it would have been brought in as a prize to a British admiralty court, and when the fact was established that it was on the high seas and was not a ship subject to British jurisdiction, it would have been discharged, and the Government of the country to which it belonged would have had a perfectly valid claim for compensation. The upshot of the correspondence is, that we are not only not near a war with England, but rather further from it than before. Whether we are any nearer a settlement of the dispute is not so clear.

The taking up of the Finance Bill by the Senate, in preference to going on with the Force Bill, does not indicate in any way the passage of the former measure. Still less does it look to the passage of Senator Stewart's amendment for the free coinage of silver. Votes were cast for the motion to take up the Finance Bill merely because it shelved the Force Bill, and on the other hand votes were cast against taking up the Finance Bill which would have been cast against the Force Bill if the question had been on the passage of the latter measure. The setting aside of the Force Bill has split the Republican party in the Senate, if not in the country at large. Consequently, we may expect the twenty-nine Senators who have been voted down by the eight bolters and the twenty-six Democrats to be particularly alert and determined to defeat what they consider a treasonable coalition. The prospect is that there will be no financial legislation at all at this session. In addition to all other obstacles, the lateness of the period at which the measure is reached, and the necessity of passing the appropriation bills before the 4th of March in order to avoid an extra session with the terrible Democratic majority of the next Congress, will conspire to prevent any decisive action on the bill. There are, in fact, several Senators who habitually lash their sides and paw up the earth for silver, who will favor postponement whenever they can do so by indirection.

Gen. Miles, who is probably as competent to speak on the Indian question as any man living, has a very instructive article on the subject in the last *North American Review*, which we commend to the perusal of everybody who is afflicted by the reports of slaughter and terror which have been reaching us every morning from South Dakota during the last few days. A worse system than our Indian system for the civilization of savages—that is, their maintenance at the public expense as armed and mounted paupers—could hardly be devised, even if it were well administered. But it is not well administered. The agencies are made part of the spoils of office, and their distribution forms one of the steadily recurring scandals of each Administration. Not only are they bestowed nearly every four years on new and inexperienced men, but they are apt to be bestowed on men who have failed in the ordinary pursuits of civilization, or have never turned their attention to any industry but electioneering. And yet the proper charge of a great Indian agency probably requires a rarer combination of talents and attainments than any of the non-professional subordinate offices of the Government. It calls not only for character good enough to bear removal from public observation, but for business capacity, for tact, patience, self-control, and capacity for command and for teaching the ignorant and the dull. That such qualifications are hardly ever thought of in appointing Indian agents we need hardly say. There is, in fact, a mass of literature devoted to the exposure of abuses caused by the incapacity or dishonesty of Indian agents. The story of every Indian trouble begins with some account of the sins, negligences, and ignorances of the agencies. There is a touch of humor given to the tragedy, too, by the arguments, constantly employed by politicians who want the agencies as spoils, that it will not do to intrust the care of the Indians to hard, cold, unfeeling men of war like the army officers; that it is only from old "heelers" and "workers" that these untutored men can get the tender and watchful care which their unhappy situation calls for.

Gen. Miles's article shows that the notion that the danger of Indian outbreaks has been removed by the disappearance of the buffalo is a great mistake. The place of the buffalo as sustenance for roving bands of rebellious warriors has been taken by the cattle of the settlers. Warriors can now maintain themselves fully as well over a vast range of country by raids on the white man's cows as they ever could by the slaughter of the buffalo herds. The Indian is, too, every year supplied with the latest and best firearms, so that the more civilization closes in about him, the more dangerous he becomes. In fact, the time has come for a radical change in our Indian policy, not on grounds of humanity simply, but as a measure of protection for the great civilized communities which are growing up around the Indians. The savages must either be civilized or extirpated. To be civilized they must be [illegible]ed, and they cannot be protected by [illegible] instrumentalities we now employ for that [illegible]pose. We had hoped that when a really [illegible]ligious man like Gen. Harrison got into the Presidential chair, the moral aspect of the Indian question would make a deep impression on him and profit by his spiritual culture.

Of all the lobby forces ever congregated at Washington to promote indefensible measures and robbery of the public Treasury, those which have been precipitated upon Congress to promote steamship subsidies have been the most shameless and persistent and cor-

rupting. The motive power of this lobby comes this time from Mr. H. K. Thurber's Brazil Steamship Company, with some help, perhaps, from the Pacific Mail Company. Mr. Thurber is one of the patriots who distinguished themselves by peddling forged quotations from English newspapers during the last Presidential campaign. The Pacific Mail Company would probably have been content to rest upon its laurels and leave Congress alone, if the allurement of a subsidy had not been dangled before its eyes by the pernicious activity of the Brazil interest. The Subsidy Bill comes up in the House as the first business after the holidays. It contains a flagrant untruth in its title, which recites that it is a bill to put the American merchant marine on an equality with that of other nations. Equality with what nations? If all the maritime countries of Europe were paying subsidies and bounties to shipping of the same kind and amount as this bill calls for, it would still be for the friends of the measure to show two things: first, that it is right and expedient and just to their taxpayers under their several circumstances to do so; second, that our circumstances are the same as theirs. Neither of these things has been proved, nor has it been proved, except in the case of France, that such subsidies and bounties are paid. France does tax the farmer and the wagon-driver to pay the shipbuilder and the ship-owner, but with most discouraging results so far as the promotion of commerce goes. French ships are built and sailed for the bounty, rather than for the trade, and so it will be here if the bill has any effect at all beyond the putting of money into the treasuries of the Brazil and Pacific Mail Companies. The English Post-office pays a fair compensation for actual transportation of the mails, and to this there is no objection. Norway, which comes next as a maritime country, pays nothing. Germany pays nothing that can be called a subsidy. What is paid by Italy or Spain or other third-rate shipping Powers is of no consequence to us, since we are not seeking to emulate them. They are not the countries referred to in the title of the pending bill.

This measure seeks to bind the Government to annual cash payments of unknown amounts for twenty consecutive years. The crowding of such a bill through a Congress discredited and beaten as the present can only be regarded as the desperate resort of men who have a few days left to work the Treasury in. They know very well that the people have pronounced against them in tones of thunder. They know that the Congress elected two months ago would reject such a measure by a two-thirds vote, because the people themselves would reject it if they had the opportunity to pass upon it. Both parties in the West are at heart opposed to it. The man who drives his canvas-covered "prairie schooner" over the plains of the Dakotas without Government aid will not be easily reconciled to the doling of his money out to ship-owners of the Atlantic seaboard under any kind of pretence. He ought not to be. The man who ploughs the land is as much entitled to bounties as the one who ploughs the sea.

There is nothing surprising in the report which comes from Ohio, that there is much less talk than heretofore among Republicans in that State about making Mr. McKinley their candidate for Governor next fall. The impression is gaining ground, even in Ohio, that the task of educating the people to a proper conception of the beauties of the McKinley tariff is a very arduous one. Instead of liking the tariff better the more they see of it, experience appears to have quite the contrary effect. At the present rate of progress, two years, Mr. McKinley's own limit, will be entirely too short a period in which to convince anything like a majority of the voters of the country that high prices are good for them and low prices "nasty" and degrading. As less than one year intervenes between the present popular ignorance and the next Ohio election, Mr. McKinley himself would probably admit that he ought not to attempt to force the issue by running for Governor this year. By the time the Presidential year comes round, his limit will have expired so nearly that he may be willing to take a Presidential nomination. If he consents to allow the Republicans to nominate him, we venture to predict that the Democrats will do nothing to interfere with the programme.

The farmers of Minnesota have got their heads cleared of the protection humbug if the resolution of the Alliance may be taken as an expression of their aggregate opinion. They adopted the following resolution at their Convention at St. Paul on Thursday:

"We demand that the war tariff, which has too long survived the object of its creation, shall be radically revised, giving very material reductions in the necessaries of life, and placing raw material on the free list, to the end that we may compete with the world for a market, and that such luxuries as whiskey and tobacco shall in no measure be relieved from internal taxation till the high protective tariff has been wholly rid of its extortions; and we especially denounce the McKinley Bill as the crowning infamy of protection."

Where, we should like to know, were those working farmers Delano, Harpster, and Lawrence when this resolution, with its demand for free raw materials, such as wool and goat's hair, was under consideration? And where were Uncle Jerry Rusk, Secretary of the Department of Agriculture, and Statistician Dodge, the farmers' guide, philosopher, and friend?

A new kind of Republican club is starting up in Massachusetts, which takes for its creed on the tariff question the following resolution:

"(2.) We believe in a protective tariff that shall impose duties where they are needed, *and only where needed*, to equalize the labor cost of production and to develop American resources and American commerce, but not to relieve favored corporations or individuals from foreign competition."

This is not McKinleyism. It is the kind of Republicanism represented by the Chicago *Tribune*, the St. Paul *Pioneer Press*, the Omaha *Bee*, the Keokuk *Gate City*, etc., in the West. It has one representative journal in Boston, however, in the *Transcript*, which says:

"The McKinley prices for all household supplies, from dry goods to provisions, are the true educators of the people on the tariff question, and ex-Congressmen are not needed to instruct them. The lesson is a severe one, and its severity is daily increasing, but it is getting in some most important work for the good of the country.'

Apropos of Mr. Henry C. Lea's hopeful view, in the *Atlantic Monthly*, of the improving effect on the Republican party of its late reverses, on which we recently commented, it will be remembered that he said among other things that the Pennsylvania election had delivered the party "from the grotesque spectacle of the predominance in such a party of a man like Quay." But has it? We find in the *Ledger* of January 3 the following account of the visit of "such a man" to Philadelphia on New Year's Day:

"He was visited yesterday at the Continental Hotel by many political workers, including friends of Bromley Wharton, who have been active in their support of that gentleman for appointment as Magistrate, to fill the vacancy caused by the death of Magistrate Smith.

"The delegation included Surveyor of the Port John J. Ridgway, J. Edward Carpenter, Richard M. Cadwalader, Frederick M. Bissel, E. C. Knight, jr., Lewis H. Redner, G. Heide Norris, Dr. James F. Hayes, E. Waterman Dwight, John S. Forbes, George Q. Horwitz, Samuel T. Pemberton, Hobart Miller, and Frank E. Bond.

"They assured the Senator that the sentiment which demanded the reëlection of Councilman Etting was equally strong in favor of Mr. Wharton, and that this sentiment should be recognized in the appointment.

"The delegation received an assurance from Senator Quay that he appreciated the position of affairs, and was anxious that the person appointed should be of irreproachable character, so that there might be no friction when the time came to select the appointee."

There is much richness in this, particularly in the character of the members of the delegation—all highly respectable and some belonging to old Philadelphia families; and in Quay's anxiety that the appointee should be a man of "irreproachable character." Quay is said to be a wag; if so, he must be having lots of fun just now.

The Buffalo *Courier* and the Plattsburgh *Republican* are having a joint debate on the fitness of Mr. Smith Weed to represent the Democrats of New York in the United States Senate, especially in his character as a supporter of the present tariff of 75 cents per ton on iron ore. The Plattsburgh paper, which supports Mr. Weed's claims, made the erratic statement that "far more labor in proportion to capital invested is required in the production of iron ore than in any other branch of iron manufacture." This certainly has a suspicious ring. It sounds like all the unprincipled rubbish which the McKinley Bill is composed of. But the *Courier* meets it with a quotation from the testimony of Abram S. Hewitt before the Tariff Commission of 1882, in these words:

"In New Jersey, where I am a miner of magnetic ores on a large scale, and in Pennsylvania, there is not a pound of ore—and I mine at least 100,000 tons—that is not put on the cars for less money than the freight from Africa and Spain to New York. This freight alone *is more than it costs me to dig my ore and pay* $1.50 *a day*."

This means that if the labor of mining iron ore in Spain and Africa cost nothing at all, the freight charges would be ample protection to the American miner without any tariff duty whatever. Now, if Mr. Weed and the Plattsburgh *Republican* cannot controvert Mr. Hewitt on this point, the less they say about Labor, the better for themselves.

The *Tribune's* Albany correspondent throws some light on the Senatorial contest. "The election of Smith M. Weed," he says, "a protection Democrat, as Senator from New York State, it is said, was strongly pressed upon Gov. Hill by Senator Gorman as one means of allaying the alarm of manufacturers at the prospective coming into power of the Democratic party, and also as showing these men that Gov. Hill is not a free-trader, like Grover Cleveland." It may well be doubted whether so shrewd a politician as Senator Gorman has shown his hand in the politics of New York on either side, but it is well known that his leanings have heretofore been towards the "protection Democrats." There are a few of these still extant, here and there, but Mr. Gorman will be the only one remaining in the Senate after the retirement of Mr. Payne of Ohio. It is for the Democrats of New York to decide whether they want to perpetuate the variety by sending Mr. Weed to Washington to take Mr. Payne's vacant place as a Senator out of harmony with nine-tenths of his party. Any Democrat who is concerned to "allay the alarm of the manufacturers" had best join the Republicans at once and give in his adhesion to the McKinley Bill.

According to the Albany correspondence of the *Times*, Tammany has sent two advance agents to the Governor demanding practical control of the incoming Legislature through its committee chairmen and clerks. Both Tammany and the Democratic machine in Brooklyn have, it is said, demanded more chairmanships, clerkships, and other minor positions than there are in the gift of the Assembly. There is nothing improbable in these reports. The Tammany appetite, always large, has been stimulated beyond all bounds by the recent victory at the polls, and it long ago became evident that this city alone would not be able to give it complete satisfaction, though extraordinary efforts have begun to be made to that end. Salaries are being increased in many instances, larger appropriations have been made for nearly or quite all of the municipal departments, every newly elected official has been compelled to distribute the subordinate offices within his gift as Tammany dictates, and it will be found, as time goes on, that the number of "places" will be steadily multiplied throughout all branches of the service. As for the demands on the Governor both from this city and from Brooklyn, it is natural that they should be made, for his following is composed exclusively of the kind of men who expect to be paid for their support at the public expense.

In the current *North American Review* the "Scholar in Politics" engages Statistics, that "modest handmaid of political science," to teach the American people how to deal with the problem of immigration. He has found in some official returns the following figures, in which the immigrants for the years 1873 to 1886 are classified:

Professional	31,803
Skilled	587,349
Miscellaneous	2,052,294
Occupations not stated	128,782
Without occupations	2,596,188

Mr. Lodge is much terrified by the great number returned under the last head, and thus comments upon the untoward circumstance: "Throwing out those immigrants with occupations not stated, it appears that, of all the vast immigration during those fourteen years, nearly one-half are persons avowedly without occupation or training, or, in other words, unskilled labor of the lowest kind, while professional and skilled labor amounts to nearly 11.49 per cent. of the whole. 'Miscellaneous,' which is neither skilled nor professional labor, amounts to 38 per cent." Further on, he finds indications that of late years this dangerous class of persons "without occupation" has "slightly increased" in proportion to the whole number of arrivals, and concludes that we have here one of the reasons why America should close the wide doors heretofore opened for newcomers from all parts of the world, and open a little postern only for the élite of mankind. Now, whatever grounds there may be for notifying Europe, as we have already notified Asia, that we want no more of her surplus millions, the 2 600,000 persons "without occupation" do not furnish any; for these persons are simply the *wives and children* of the adult men whom they accompany or follow. That only 48.1 per cent. of the immigrants are thus classified, instead of 60 or 65, shows that much of the immigration—say one-fourth of it—does not come in family groups, but is made up of young men and young women seeking to better only their own fortunes.

The *Engineering News* publishes statistics of railway-building during the past year which show that 5,981 miles were added during the twelve months—viz., 3,181 miles in the South and Southwest, and 2,800 miles elsewhere. The Northwestern section (Minnesota to Montana) had 991 miles, the Pacific States, including Utah, 696, the Northern Central States (Ohio to Wisconsin) 693, the Middle Atlantic States 328, and New England 92 miles. The year's work brings the total mileage in the United States to 167,255, or more than sufficient to span the world six times. Hitherto the business prosperity of the country has been intimately associated with new railway construction. The building and equipping of new lines puts countless wheels in motion, and provides employment for capital and labor in a great variety of forms and places. The work is nowhere near completion. It will go on for many years, and even after the country is laced with as many lines as the traffic will support, the work of improving the existing roads will call for very large outlays, as is the case in old England and in New England at the present time. But the heyday of railroad-building in our own country is past. There is much undeveloped territory still in the Northwest, much in the South, and there are spots all over the Union which will bear some further elaboration. But the great distances have been spanned, and the wide expanses of fertile soil and valuable timber have been pretty well covered, so that we must look eventually, and at no very distant day, beyond our own borders for the profitable employment of surplus capital which has heretofore been absorbed in new railway construction.

The establishment of savings banks in the South is a noteworthy evidence of progress in that part of the country. Such institutions have been almost unknown there, and the absence of secure repositories for savings has been a great obstacle to the development of thrift. Memphis has been one of the first among Southern cities to realize their importance, and they have multiplied within the past two years until there are now seven. The fact is both the cause and result of the fortunate condition of the city as thus described by the *Appeal-Avalanche*: "Memphis is remarkable for its peace and good order. At night the streets are quiet. The average man prefers to spend his evenings at home. During the day groups of loiterers are rarely seen. Everybody seems to be at work. There is no lack of employment. In all quarters of the city scores of new residences, valued at from $2,000 to $5,000, have been built within the past two years, or are in course of erection. These structures are the work, in large measure, of men and women of moderate means. To them, and to those who wish to build homes at a future time, the savings banks are essential." The negro has suffered perhaps more than the white from the almost entire absence of savings institutions in the South. Thrift was the first lesson which a race just entering upon freedom needed to learn. It is not too much to say that the failure of the Freedman's Bank was the greatest misfortune the negroes have suffered since emancipation, for it was calculated to destroy the virtue of thrift just as it was beginning to develop. Practically it put the race back in this respect fully twenty years, for the bad effects have been felt down to the present day.

R. G. Dun & Co.'s tables of mercantile failures in the United States for 1890 foot up 10,882, with liabilities of $189,856,964, as against 10,679 with liabilities of $148,784,337 the previous year. The showing is by no means unfavorable when compared with the years 1873, 1875, 1876, 1877, 1878, and 1884, all of which showed a larger aggregate of liabilities of failed firms. The failures of the year 1857 exceeded those of 1890 by $2,000,000, although the amount of capital invested then was probably not more than one-third what it is at present.

"DEATH OF THE REPUBLICAN PARTY."

By the votes of eight Republican Senators uniting with the Democrats, the Force Bill was on Monday set aside in the Senate. The shelving of the measure is universally regarded as equivalent to its rejection, and even Senator Hoar admitted that it would be useless to press it further.

This result is occasion for hearty rejoicing on the part of all patriotic citizens, North and South, and congratulations should be extended to the Republicans who brought it about—Messrs. Teller and Wolcott of Colorado, Washburn of Minnesota, Stewart and Jones of Nevada, McConnell and Shoup of Idaho, and Stanford of California. It is an ideal retribution upon Republican Bourbons of the Hoar school that the two new Senators from Idaho, who had been admitted before the Territory was qualified to become a State, in order that they might help to impose radical legislation upon the country, should have cast their first votes on the other side.

The significance of the result will appear more clearly as time passes. Senator Hoar, extraordinary as it may seem, perceived it instantly, and stated it clearly. "Five minutes after the vote was taken which announced the death of the Force Bill," says the correspondent of the *Sun*, "the Massachusetts Senator walked down the marble steps leading to the restaurant, and, in answer to the query of a friend, said in an emphatic and solemn manner, 'That means the death of the Republican party.'"

In truth, the Force Bill scheme was the last rational attempt which is possible to maintain the theory that "the mission of the Republican party" is not yet fulfilled. That party was organized for a single purpose—to resist the aggressions of slavery. Its first national convention, in 1856, assembled in pursuance of a call addressed "to the people of the United States, without regard to past political differences or divisions, who are opposed to the repeal of the Missouri Compromise, to the policy of the present Administration, to the extension of slavery into free territory, in favor of admitting Kansas as a free State, of restoring the action of the Federal Government to the principles of Washington and Jefferson." The second national platform, adopted in 1860, began with a declaration that "the history of the nation during the last four years has fully established the propriety and necessity of the organization and perpetuation of the Republican party, and that the causes which called it into existence are permanent in their nature, and now, more than ever before, demand its peaceful and constitutional triumph."

From 1856 to 1888 the Republican party continued a political organization primarily devoted to issues growing out of slavery. For the first half of the period it really had a "mission." Before the war it was necessary to restrict the progress of slavery. When, through the war, slavery had been abolished, it remained to pass the constitutional amendments which made the black man the equal of the white before the laws of the land. That done, the work of the Republican party as it was organized in 1856 was completed. But its managers had found the slavery issue so profitable that they sought to perpetuate it. When the party came into power for the second time in 1889, it was on a platform which proposed two important policies growing out of the slavery issue, both of which were contrary to all the traditions and precedents of our history during the century from Washington to Harrison.

One of these policies proposed that the Federal Government should assume control of the schools in the States, by making appropriations from the Treasury at Washington for distribution among them, supervision necessarily following the appropriation. The other proposed that the Federal Government should assume control of the elections for Congressmen in the States, such control necessarily involving interference with the supervision by State authorities of the State elections held at the same time. Both of these measures were advocated expressly in behalf of the negroes, and as essential sequels to their emancipation. The Blair Bill was urged on the plea that the Southern States would not educate the blacks, and that consequently the Federal Government must interfere; the Lodge-Hoar scheme on the plea that the Southern States would not give the blacks fair elections, and that consequently the Federal Government must interfere.

The first of these policies was rejected last March, by reason of the defection of a number of Republican Senators. The other was rejected on Monday, by reason again of the defection of a number of Republican Senators. In each case Republican Senators rejected fundamental principles of the last Republican national platform, and declared their conviction that the Democratic party was right in opposing those principles. The eight recalcitrants of Monday voted against the principle which was set down as first and chief in the resolutions adopted at Chicago in 1888.

Moreover, it is well known that the open opposition to the Force Bill in the Senate represented only a small part of the actual desire for its defeat on the Republican side. What is still more important, the opposition in the Senate, both open and secret, does not equal the opposition among Republicans throughout the country as their views find expression in the party press. In other words, a large proportion of those who have called themselves Republicans are against a policy the enforcement of which the last national platform declared to be the chief reason for the party's existence. Under these circumstances Mr. Hoar is probably right if he said that Monday's vote "means the death of the Republican party."

Political organizations, like individual politicians, often do not recognize that they are dead for some time after the event. The Whig party really expired in 1852, although the funeral ceremonies did not occur until a good while later. In like manner, the Republican party may survive for some time as an opposition to the apparently eternal Democracy, but its fate as an organization based upon the slavery issue is sealed. There is no longer any "propriety or necessity for its perpetuation."

The defeat of the Blair Bill last March meant that the black man must "take his chances" with the white man in the matter of schooling. The rejection of the Force Bill means that he must take his chances also in the matter of voting, like the "Canuck" in New England, the "Dago" in New York city, the Pole in the manufacturing cities of Pennsylvania, or the Scandinavian in the agricultural regions of the Northwest. "When a man has emerged from slavery," said truly the Supreme Court of the United States in annulling for unconstitutionality the Civil-Rights Act, "and by the aid of beneficent legislation has shaken off the inseparable concomitants of that state, there must be some stage in the progress of his elevation when he takes the rank of a mere citizen, and ceases to be the special favorite of the laws, and when his rights as a citizen or a man are to be protected in the ordinary modes by which other men's rights are protected."

The rejection of the Force Bill means that this "stage" has been reached, and consequently that "the mission of the Republican party" has been discharged. The future of political organizations cannot be forecast, but Senator Hoar is right in regarding Monday's action in the Senate as ending a chapter in our history.

SENATOR SHERMAN ON FREE COINAGE.

When the debate on free coinage of silver was started in the Senate by the setting aside of the Force Bill, the cause of sound money found a ready and well-equipped champion in Senator Sherman, who led off in a speech of unusual strength and earnestness. The text of this speech, as published in the *Record*, is much more effective than the newspaper reports indicated, and much less crippled by the commitments of the Senator to the Finance Bill of the last session or the one now pending. As to these half-measures, Mr. Sherman was particular to say that he yielded his own judgment to the supposed necessity of a compromise, but he did not refrain from pointing out the erroneous principles of those measures. Both measures, providing for increased purchases of silver by the Treasury, are bottomed on the thesis that Government ought to do something for that suffering metal, something to lift up its drooping head and advance its price in the market. The judicious and benevolent intentions of Congress, as expressed in the bill of last session, had (it was said) been frustrated by speculators. The Government had been buying four and a-half million ounces per month, but in spite of these well-meant efforts to revive silver and bring it to a parity with gold, there had been an accumulation of twelve million ounces from various parts of the world in the New York market, and the Committee on Finance had been besought to take off that load, and so give silver another

chance. Upon this point Mr. Sherman remarks:

"I do not believe that was a wise idea; but still, in common with the President, the Secretary of the Treasury, and the general feeling on this side of the Senate, we thought it was better to relieve the minds of our friends from this load, as they said, which bore down the market, and we proposed by the first section of the bill to buy that bullion at its market price and get it out of the way."

Something might be said here about Mr. Sherman's own shortcomings. Apparently he puts some blame on the speculators for frustrating the good intentions of the act of last year. "If they had waited," he said, "and allowed the ordinary course of the business world to deal with the masses of silver that were brought out; if we had purchased regularly at the market price four and a half million ounces of silver a month, the advance in the market value of that silver would have gone forward slowly and gradually, and in a few years it might have reached the standard of gold. But that was not the policy. Speculations were entered into," etc. If we are to treat this conception seriously, was it not incumbent on the statesmen who passed that bill to take speculation into the account as a factor to be reckoned with? People will always be found ready to make money by buying property that they think is going up, or by selling what they think is going down. To legislate as though such persons did not exist would be very foolish indeed. But it is not true that the speculators prevented any beneficent results from following the Silver Act of last year. They could no more make a permanent price for silver than the grain or cotton speculators can make a permanent price for those staples. Moreover, it was not for their interest that the price of silver should fall. On the contrary, it was greatly for their interest that it should rise—the higher the better for them. They set out, according to the programme published at the time, to carry the price up to 129. They got it up to 121, and at that point so much bullion came forward from one place and another that they could not carry it.

All this by way of apology for a bad measure in order to avoid a worse one. But it appears that the worse one is not avoided—not if the free-coinage phalanx, led by Stewart and Teller, can muster a majority of votes in favor of the amendment proposed by the former to the pending bill. That amendment is for free coinage of silver, or rather for free bullionage, which is worse, since coinage takes time, while bullionage precipitates upon the country, in the form of legal-tender certificates, all the surplus silver in the world at once, or as fast as it can be collected together and presented at the mints. Against free bullionage or free coinage Mr. Sherman brings all his powers as a debater, a financier, an economist. He shows that this means the demonetization of gold and the striking out, at one blow, of the larger half of the circulating medium, and the oncoming of a financial crisis more sweeping and disastrous than the world has ever seen. He shows, too, that instead of raising the price of silver bullion, the free-coinage bill would cause it to fall, since then it would exchange for other commodities only at its actual value, whereas now its value is enhanced by the Government's purchasing arbitrarily the entire product of our own mines.

It is a noteworthy fact that one of the effects of the recent pinch in the money market has been to close a large number of silver mines in Colorado. The operation of cause and effect in this case is perfectly clear. The apprehension of the silver standard led to a hoarding of gold. Every gold dollar drawn causes the banks to curtail at least four dollars of their loans and discounts. The banks of Colorado could no longer make their customary advances to the smelters, who could no longer buy the ore from the miners. Hence all of the latter who were not forehanded and able to do their own smelting or to pile up their ore were obliged to stop work. If this was done in the green tree, what shall be done in the dry? If the small mines have suffered by reason of a slight contraction of the loans and discounts of the banks, what will happen when one-half of the metallic money of the country, which is the half upon which loans and discounts are based, is stricken out altogether?

Mr. Sherman has presented in stronger terms and with greater fulness the ideas embodied in the letter of President Cleveland to Mr. Warner of Ohio in February, 1885. It is easy to say that the trouble which Mr. Cleveland predicted has not come to pass. The truth is that it was only postponed, and it is not far distant now, if the present programme of the silver-men is to be carried out. We have had a foretaste of it in the past sixty days, and we shall get another and a more bitter one just in proportion as we approach, or as the public think we are approaching, the silver standard. And this experience will be repeated just as often as that apprehension comes. We shall live in a semi-panic until all such fears are dissipated. Industry will be ground down, factories and mines will be closed, bankruptcy will be chronic, and distress will be so great that even the misery of the McKinley Bill will be forgotten.

A LESSON IN BALLOT REFORM.

THE grave controversy at Hartford over the Governorship is a most timely warning as to the unwisdom of all secret-ballot laws which do not provide a genuine official ballot. To the absence of any such provision in the existing Connecticut Ballot Act, passed in 1889, many of the present complications are due, and many more are certain to ensue hereafter unless there is an essential change in the new voting law of the State. The experiences with that statute are an instructive chapter in ballot-reform legislation, especially at the present time, when many State legislatures are soon to meet and either pass new ballot acts or revise those already adopted.

Near the close of the long session of the Connecticut Legislature of 1889, there was passed an excellent ballot bill, modelled on that of Massachusetts. There was at the time of its passage little doubt that Gov. Bulkeley would approve the measure, as he had intimated that he would do so. But at the eleventh hour some of the "practical" politicians of the State got his ear. They professed to have discovered "complications" in the bill which would make it "clumsy" in its operation. So, acting partly under their advice and partly under his own later and more partisan impulse, the Governor vetoed the measure, and his veto was sustained by influences brought to bear on certain legislators. But the clamor excited by the Governor's act, his public likeness to Hill which the Connecticut papers began to point out, and the grave responsibility which the Republican party had assumed, scared its leaders. So, almost at the last legislative day, the present crude law was hatched, rushed through both houses, substantially without amendment, and promptly signed. Naturally enough, it was filled with verbal blunders and with doubtful phrasing, but to these we do not now refer. The point we wish to emphasize as the immediate warning, is the fact that, although it compelled the State to stamp the ballot as "Official," to supply the paper for the ballots, and to specify the type to be used, the law gave the printing and the distribution of the ballots, in any number desired, to the party managers.

Now let us see how these pseudo-official ballots have worked in practice. Altogether there have been held under the Connecticut law, since it was passed, two local elections in each city and town of the State, and one general State election. At all of these contests there have been endless wrangles as to the proper and legal form for printing the ballots, the use of pasters, the places where the ballots could be put, and half-a-dozen other matters. A number of cases, moreover, have already got into the courts. One was the case of the "Citizens' tickets" put out at Hartford last spring, which the Supreme Court in October found illegal, and which so tarnished Gov. Bulkeley's name. Besides, there has been the contest over the "For" votes which now awaits a Supreme Court decision; the blanks on the Prohibition ballots left under the title of Judge of Probate, which Judge Hall of the Connecticut Superior Court has decided to be illegal, and which may yet throw out several thousand votes in the State; the rejection by the moderator of more than a hundred votes in Bridgeport said to have been marked; and other questions without number which either party can raise if it wants to. All but one of the cases stated enter into the Governorship contest now pending. As a direct result, therefore, of the blunder of letting the parties handle the ballots, the State is plunged into a bitter and involved party conflict affecting the whole administration of the Commonwealth during the next two years, the outcome of which no man can now see.

Another old and familiar device which has been tried anew in Connecticut and has been found defective is the "envelope" plan. It was held by the promoters of the new

law that the envelope assured secret voting, and to some extent it did protect the voter, as the election returns from the "bull-dozed" factory towns showed. But, on the other hand, in almost every Connecticut town at the last election a number of votes were lost from failure to seal the envelopes, and the total number of votes thus nullified in the State must have been several hundred—enough, perhaps, to have changed the whole result of the election and to have averted the impending contest. Again, at each election some of these envelopes have been missed. This means their possible misuse by political tricksters in working the "Tasmanian dodge," and sending around the bribed voter with a sealed envelope to bring back one unsealed to prove his fulfilment of his evil compact. Unless the State Ballot Act is changed, or unless the Secretary of State varies, as he has not hitherto done, the form or color of the envelopes, those that are outstanding now may be used at future elections, not only for purchasing the voter, but also for certifying the delivery of his venal ballot.

The sharp lesson which these Connecticut experiences teach us is, that for the State ballot pure and simple, without any clumsy "envelope" attachment, there can be no adequate substitute. Any other plan necessarily leaves the party with its blunders and trickeries as an agent in the voting mechanism. Between the old method of voting and the real official ballot there is no compromise. We must either adopt a plan in which the ballots are prepared and given out in the voting-room by officers sworn under penalties to the faithful and accurate performance of duties, or else let the politician "run" the ballots, with the certainty that they will be botched by his knavery or ignorance. To a real official ballot we can justly attribute the smoothness and accuracy with which the Massachusetts Secret-Ballot Act has done its work; and to a hybrid system we can with equal certainty charge the legal snarls and the befogged Governorship contest in which the sister State of Connecticut, just over the Massachusetts line, is now so deeply involved.

CORRUPTING TESTIMONIALS.

During the examination of Mr. Porter, the Commissioner of Charities and Correction, the other day, before the Fassett Committee, the appointment of "Fatty" Walsh to the Wardenship of the Tombs came up, and Mr. Porter mentioned the names of several prominent citizens who had signed testimonials recommending him for the place. Mr. Ivins, who was examining the witness, thereupon added, as reported in the *Evening Post*, that "if he had been asked to sign the recommendation for his [Walsh's] appointment, he would have done so, as he thought he was a good enough man for the place and able to do the work." As this seemed somewhat startling, Mr. Ivins was asked for a confirmation of it, and he corrected it as follows:

"The reporter who wrote that caught the spirit of what I had said, but not the letter. I did say that if I been asked *at that time* to sign the recommendation for his appointment, I should have done so. I considered Mr. Walsh at that time a good enough man for the place. If anybody had asked me to recommend him for appointment as warden of a penitentiary or State's prison, I should have refused, because I never should have considered him fully capable of filling such a position."

Now, the difference between a State prison or penitentiary and the Tombs is that the two former are places of punishment, while the Tombs is a place of detention in which persons are confined while awaiting trial or the execution of the death penalty, or in default of bail. The inmates of the Tombs, too, are a much smaller number than those of the penitentiaries, and therefore, on this account, that prison presents fewer difficul ties of administration. But Mr. Ivins's notion that persons confined in the Tombs are not entitled to as much consideration from the city government as persons confined in any other prison, is, coming from a reformer engaged in actual reform work—taken *flagrante delicto*, so to speak—so curious and likely to prove so mischievous, and has already produced so much mischief, that it deserves some notice.

There appears to be at the bottom of it some sort of vague impression that the character of jailer should in some degree depend on the character of his prisoners, and that if they are mostly riffraff, such as find their way to the Tombs for want of bail, anybody is good enough to take charge of them. There is nothing new in this idea. It governed the prison administration of nearly every prison in Europe before Howard's time, and produced the horrors in English and Continental jails of which people now read with a shudder, and the disappearance of which is used in histories as illustrating social and religious progress. It was succeeded by the idea, which is now supposed to govern the penal system of all Christian nations, that the officers who represent the State in its management of the helpless portion of its population, namely, its criminals, paupers, and lunatics, should be taken, to use the words of our illustrious Mayor, "from the highest order of citizenship the county affords"; that is, that no man can be too wise, or too good, or too humane, or too experienced to take charge of a jail or an almshouse. He should represent to the unfortunate inmates the community at large in its best moods, and show, both in his character and career, the qualities on which it teaches its children to set most value.

That the services of such men cannot always be procured for such work does not affect the rule. It is the duty of civilized governments to seek them by every means within their reach, and the duty of all good citizens, and especially reformers, to proclaim the need of them in season and out of season. We have no more right to allow cruelty or injustice to be practised on the prisoners or paupers than on any other class of the poor or unfortunate. Our duty to them is not measured by their deserts, but by our obligations as civilized men administering a Christian government. Moreover, the prisoners in the Tombs are not necessarily criminals. Every man in America is held to be innocent of crime until he is proved guilty, and most of the Tombs prisoners are persons who have not been proved guilty of anything. It probably contains throughout the year many scores who are innocent in fact as well as in law. But whether really guilty or simply friendless and unfortunate, we are none the less under a solemn obligation not to put them into the hands of men of bad character or ruffianly temper.

Mr. Ivins's qualification in his corrected statement, that he would have signed "Fatty" Walsh's recommendation at the time of his appointment, with the suggested inference that he would not sign it now, having seen "Fatty" dismissed for misconduct in office, does not mend matters very much. All candidates, everywhere but in Bouffeland, for administrative offices which they have never filled before, rely mainly on their character and previous career to prove their fitness. If they have no marks for experience, their standing in honesty, integrity, and efficiency must be at least 100. The theory that if the work desired be the care of bad men, the candidate need not be a good man, is about as rational as the famous assumption that a man "who drives fat oxen must himself be fat." There is no rationality in it. It is a nursery theory. If "Fatty" Walsh was fit to take charge of the chief prison of a great metropolis, it would prove the folly of inquiring into a man's antecedents before giving him any responsible place whatever. Fatty's career, in fact, ought, anywhere but in Bouffeland, to have proved his special unfitness for the care of the criminal class. A rumseller and gambler is in New York the very last person to receive a share in the administration of criminal justice. Whatever would be considered a disqualification for any respectable private place, ought to operate as a disqualification for this.

The incident on which we are commenting is a good illustration of the way in which the growth of the criminal and semi-criminal class in this city is fostered by the moral and religious and well-to-do. We venture to assert that this reckless signing of testimonials in which so many respectable men indulge is a direct premium on crime and disorder. There are thousands of young "toughs" in this city beginning life very much as Fatty Walsh began his, and who, if they reach middle age, will have passed their lives as he has passed his. We invite the lawyers and merchants and judges who sign these testimonials to ask themselves what the effect on the juvenile criminals and rowdies of our streets must be of seeing careers of violence and disorder and lawlessness rewarded with well paid wardenships of prisons and seats on the judicial bench. Every year the mire of our semi-criminal politics gets a little deeper, but we never unearth one of its scandals without coming on a lot of semi-religious promoters of it in the persons of certificate-writers.

THE ENGLISH UNIVERSITIES IN WINTER.

London, December, 1890.

Cambridge and Oxford lose much of their enchantment, in externals at least, to those who have seen them only in their summer attire, if they revisit them at the wintry season. There may be green turf in the courts of the

colleges, and here and there an ivy still of dark green; but the bare anatomy of the trees and the dull expanse of many leafless vines on their walls serve to emphasize the naked decay of a large part of the buildings, and one looks upon them as upon monarchs in tatters, and they are easily dethroned in the imagination. I never felt before so much—for this is my first sight of these university towns in the cheerless season—that hoar antiquity, or the *quasi*-antiquity which the English climate so speedily produces, gains most of its loveliness from the verdure which shrouds it. It seems, too, as if there had been of late years a good deal of stripping of the ivy from the walls, to arrest the decay and disintegration which, with all its beauty, it serves to produce. The grimy and ragged aspect of the worn-out stone facings of many of the college buildings—more, perhaps, in Oxford than in Cambridge—is far from pleasing; nor is the sensation much helped by the painful contrasts where a spotted restoration has been made.

But friendly sympathy, eliciting the most hospitable of courtesies, makes the visitor in this season, when so much depends on indoor intercourse, delay his departure from either of these academic circles. I came to them from Edinburgh, where the professors of the University had been very kind, and even endeared to me; but the absence of the college halls is an unpleasing contrast, and the cosiness of a don's chamber has no counterpart in the Scotch University, or even in our own. One remembers a dinner or a lunch at a master's lodge as a board of which one may have some conception at the table of the president of an American college; but a dinner at the high table of Trinity or King's, or St. John's at Cambridge, or at New College or Queen's at Oxford, is something not within our American academic experience. The Latin grace at the beginning is said, by varying custom, sometimes by a scholar and sometimes by whatever senior officer may chance to be at the high table. At Trinity in Cambridge, it was read in alternating sentences by the Vice-Chancellor—now the Master of that College—and by Aldis Wright, the Shaksperian, the Vice-Master. It is, perhaps, owing to the less diversified dinner of the undergraduates on the floor of the hall that their repast is sooner ended than that of the dons. They steal out of the hall, each one as he finishes, and the stranger on the dais, eager in talk with his neighbors, suddenly awakes to the apprehension that there is no one left in the hall but the occupants of the high table.

Customs in the two towns and at the colleges in the same town vary much. The final grace is said at the high table. The sign for it in at least one hall in Cambridge is that the head-waiter places a large silver loving cup before the presiding officer. On rising from the table the dons retire to a room which they call in Cambridge a "combination" room, and in Oxford a "common" room. It is usually a large and handsome room, hung with the portraits of eminent graduates of the College. In retiring to this room, it seems to be the custom in Oxford to take the dinner napkin along with you; in Cambridge it is not. Here again I found different practices prevail in the half-dozen halls in which I dined at the two universities. At Trinity in Cambridge, for instance, you sit in this room at a long table and help to keep the decanter in motion, and have some biscuit and cheese with celery to nibble at. The usual practice, however, is to sit in a semi-circle before the fire with little round tables for the dessert and glasses, either in front of each chair or between each two. The propulsion of sherry, claret, and port—these seem to be the orthodox wines of this after feast—gives a man something to do, in the gaps of conversation. With the fireplace forming the link which connects the ends of the horse-shoe curve of sitters, there is a difficulty in the course of the viney propulsion. At some colleges I found they got over it by reversing the direction; but at New College and Queen's in Oxford, they had devices of their own. At the one a little track ran along the hearth and sustained a little carriage, in which the restless and viney vessel sped across the hot side of the circle; and at Queen's the track was placed upon the mantel-piece. After a half hour or more spent in this room, the dons separate for the smoking-room, if they have one, or break up into little parties, and go to the rooms of one or more of their number, and continue the talk in a cloud of smoke. By this time the intercourse becomes more friendly, and the guest of the evening, who is likely to be of the same party, finds a succession of companionships in talk likely to keep him amid such hospitality till towards midnight. As he makes his somewhat angular march to his lodgings, forced into zigzags by the perversity of the short cuts in the narrow streets, he is pretty sure to encounter the proctors, with their attending "bull dogs," on the watch for vagrant students.

I saw something of the literary activities of the two universities; but that which most interested me at Cambridge was the work which I found Aldis Wright doing for a new edition of his standard Shakspere. The coming edition will appear under his sole charge, and his own critical instincts will have fuller play than when he worked on the earlier edition in connection with a collaborator. There will be accordingly some revision of judgments. The edition will be kept at its old number of volumes, but each will be increased in bulk. I found he had three volumes nearly finished; and the publication will begin, I think, with the New Year for volume i., and with a reserve of completed volumes sufficient to insure a regular periodicity in publication. The student of Shakspere will remember that this long-established Shaksperian text now under revision was made with the great advantage to be derived from the use which the editors could easily make of Capel's wonderful collection in the library of Trinity, and with such reference as was occasionally necessary to the twin accumulation which stands in Malone's name in the Bodleian at Oxford. I have recently looked, for the second time in twenty years, at these marvellous accumulations for the Shaksperian student. It was easy to observe that the catalogue of the Barton collection of Shaksperiana in the Boston Public Library—which collection it fell to my lot to arrange in 1873-'77—is a not unused key to the use of similar collections here.

At Oxford I visited Dr. Murray and his workshop, where the great historical Dictionary of the English Language which bears his name is in the course of compilation. The University people speak of Dr. Murray's *scriptorium*, and when I handed in my card at his house a little way out of town, the doormaid asked me to step round to the *scriptorium*. This is a building built of corrugated iron, which stands in the rear of Dr. Murray's residence, and it is the workshop in which he and his staff are engaged. You are struck first on entering it by the array of the fore edges of the slips showing by citation the use of words during the successive periods of the language. These slips stand on shelves, edgewise, as high or higher than you can reach, on all the walls of the room, and the mass represents the results of the reading of a large number of scholars who have been employed to read for changes in the use of words through the historic periods of the English tongue. The number of such readers embraces scholars wherever the English language is spoken—in Europe, America, or in Asia. On slanting shelves everywhere that the spaces of the room admitted, the leading dictionaries, whose collation is found necessary in passing on from word to word, are arranged, open at the points of present attention, so that the collator passes with the least impediment from one dictionary to another. It has been my fortune in years past to have been in the similar quarters of the staffs of the great dictionaries of Webster and Worcester, and more recently in that of the still larger 'Century Dictionary' in New York; but the work or aims of no other has required quite the same extension of detail. I have spoken in previous letters of two books which have come in my way during my present visit to England, which had been scored by Dr. Johnson when he was reading for his own dictionary. One I had found in the possession of Mr. Samuel Timmins of Arley, another at the Chapter Library at Lichfield, and a third Dr. Murray now showed me among the books in his own working collection.

I found Dr. Waldstein at Cambridge just closing up his University lectures preparatory to starting to take charge of the American School of Greek Archæology at Athens.

JUSTIN WINSOR.

TALLEYRAND IN LONDON AND AMERICA.

PARIS, December 25, 1890.

M. PALLAIN, the Director of the French Customs, employs his leisure in historical work. He has turned his attention to the diplomatic correspondence of Talleyrand, and published already the inedited correspondence of Talleyrand with King Louis XVIII. during the Congress of Vienna. He intends to publish later a relation of his administration while he was Minister of Foreign Affairs of the French Directory, his memoirs and reports addressed to Napoleon I., his instructions to ambassadors, his correspondence with his secretaries, etc. The volume just issued relates to Talleyrand's mission to London in 1792, and contains also his letters to Lord Lansdowne, written from the United States after 1794.

Talleyrand arrived in London on January 12, 1792, with the mission of forming a defensive alliance between France and England. On his deathbed, Mirabeau, who was the colleague of Talleyrand in the Diplomatic Committee of the Constituent Assembly, had recommended this alliance to him. All the recent researches and publications of Sybel and others have proved that Europe was never really united against the French Revolution. Prussia, Russia, Austria had views and interests of their own which could not well be reconciled. England did not really wish to make war so long as Antwerp and Amsterdam were not threatened. The first coalition had been broken after two years of vain and disconnected efforts. The death of Leopold and the excesses of the French Revolution had been the signal for a second coalition. Talleyrand suggested that a mission should be sent to Prussia, and offered to go himself to London in order to neutralize the efforts of the coalition. England was still neutral, and was in an expectant attitude.

Talleyrand felt convinced that England would not join the coalition if France did not attack the Netherlands. Lord Grenville clearly explained to the French Ministers that the

Netherlands were the tie between England and Europe; at the Congress of Utrecht, England had stipulated that the Belgian provinces should never go out of the House of Austria—they were to remain a permanent barrier between France and Holland. England remained in reality neutral, and resisted all the offers of the Continental Powers till the French Government adopted a policy of conquest and of propagandism. In vain did Talleyrand furnish arguments in favor of a policy of non-intervention; the Revolutionary Government wished to create new republics, and was not long in threatening the Stadtholder of the Netherlands. Talleyrand, by his ability, had brought England to the acceptation of the French occupation of Belgium; it was the maximum which England would and could accept. Holland was to be left outside of the influence of France. But the policy of Talleyrand was not adopted, and, after the famous 10th of August, his mission came to an end. He remained in London no longer as an Ambassador, but as a refugee. He asked first the Grand Duke of Tuscany for permission to retire to his States; his request was refused. In January, 1794, he received from the English Government an order to leave England in twenty-four hours. On the 3d of February, 1794, he left for America, where he remained till 1796.

His correspondence with Lord Lansdowne is published for the first time by M. Pallain, to whom it was generously lent by the present Lord Lansdowne. It begins with a letter written as far back as October 3, 1791, from Kensington Square. He replies to Lord Lansdowne, who had asked him to make him a visit at Bowood, that he is detained in London by the necessity of giving help to some French friends "devoted to the cause of liberty, but turned out by pikes." . . . "At a moment when everything is denaturalized and perverted, the men who remain faithful to Liberty, notwithstanding the bloody mask which atrocious scoundrels have put on her face, are very few in number. I cannot weary of admiring M. de Montmorency and M. de Beaumetz, who have come to me after having for a whole month been on the point of being murdered, and who still love liberty even for France and detest the foreign invasion." Then comes a good picture of the debasement of France under the Terror: "The clubs and the pikes kill all energy, and accustom the people to dissimulation; and if we allow it to contract this infamous habit, it will soon find happiness only in a change of tyrants."

The second letter of the collection is written long afterwards, in Philadelphia (Feb. 1, 1795), and it has so much interest that I may be allowed to give exceptional attention to it. Talleyrand was led to examine "what are the necessary relations that exist between the United States and England; what are the *true* dispositions of the two peoples towards each other." In order to answer this question, he looks beyond the present moment and makes conjectures regarding a distant future. The passions ruling in 1795 will not be the passions ruling in the nineteenth century. He tells Lord Lansdowne very frankly that "the ties which united America and England when America was the subject and England the sovereign, are inevitably destroyed; and all hope of resuscitating them, all effort in that direction, all expectations given or accepted on this subject, must be looked upon as the dream of a delirious imagination or of a coarse and lying adulation. This I hold to be admitted." It would seem at present (1795) as if there were in the United States a strong inclination towards France and a great aversion for England. Talleyrand explains this state of things by the remembrance of the War of Independence; he admits that there are moments when the new Republic, though it is in essence pacific, would seem to be inclined to let the balance of neutrality fall on the French side. He finds England at fault for exercising her neutrality, as far as America is concerned, in a manner which resembles open hostility. He adds, however, and here one must admire his foresight and his powers of observation, that "it requires more time and reflection than is at the service of an ordinary traveller to find out that, notwithstanding these circumstances, *America is still all English* [*tout anglaise*]; by which I mean that *England has still every advantage over France for deriving from the United States all the benefit which a nation can derive from the existence of another nation.*" (These words are underlined in the text.)

How can a nation be useful to another nation? It must first desire it and then be capable of it. Talleyrand boldly assumes that the natural inclination of America is "in favor of England." This proposition might seem paradoxical; but the war had come to an end, the pride of America was satisfied; the Americans are governed by their passions less than any other people; all their habits make them tributary to England with a force of necessity which no declaration could diminish.

"The similarity of language establishes England's right of ownership over all the inclinations of the Americans in an irresistible manner. It fixes between the men of the two countries a common character which will always unite them and make them recognize each other. They will naturally think themselves at home when they travel in each other's country, and they will exchange with a reciprocal pleasure their full thoughts and a discussion of their interests, while an insurmountable barrier is placed between peoples of a different language who cannot pronounce a word without warning each other that they are not brothers, and to whom all transmission of thought is a painful task and no longer a pleasure."

Talleyrand notes besides in the Federal Constitution a great resemblance to the leading traits of the English Constitution. He speaks of the habeas corpus, of trial by jury. In the discussion or application of the laws who is cited? Whence are the analogies taken, and the examples? In the customs and rules of the British Parliament, in the common law, in the statutes and judgments of the English courts. "It is in vain that the words republic and monarchy seem to raise distinctions between the two Governments which cannot be confounded. It is clear to any man who goes to the bottom of ideas that something savors of *republic* in the representative constitution of England and something of *monarchy* in the Executive power of America." When Talleyrand wrote these lines, Gen. Washington was President, but their truth was independent of his great prestige and popularity.

Talleyrand explains afterwards how the French Ambassador tried to interfere with the establishment of the Federal Constitution and to keep the States disunited. "He wished to condemn them to a long and painful infancy before they could be emancipated without having the wisdom to conduct themselves or the strength to protect themselves. Such were the instructions of M. de Ternant, then the King's Minister to the United States." Talleyrand sees in the efforts of M. de Ternant and afterwards of Genêt the germ of anti-Federalism. The Federalists became instinctively hostile to France, and their hostility became more and more marked. These men, "though they had applauded the first efforts of France towards liberty, did not see with pleasure that she was taking a new road in the art of constitutionalism, and opposing the experience of England with bold essays which furnished momentary weapons to their adversaries. These interior motives have insensibly established between the so-called democrats and the so-called aristocrats in the United States an issue on a point which ought to remain entirely foreign to the objects of the two parties, viz., the inclination towards the French or the inclination towards the English."

Talleyrand concludes his letter, which is in reality a long memoir, with commercial and economical considerations which have not lost their value, but which I have no room to translate. He ends by advising England to treat the United States with the greatest consideration, to send to Washington distinguished Ministers. "I conclude by saying that the Americans will remain independent, that they will be more useful to England than any other Power, and that this utility will be proportionately augmented as the English Government lays aside the haughty forms which it now employs in its relations with America."

There are three other letters addressed by Talleyrand to Lord Lansdowne, from New York, but they have no great importance. One of them relates to the Jay Treaty. "All the debates on the Treaty have been kept secret; though the parties were very much excited, nothing has transpired."

I recommend to all the readers of M. Pallain's new volume a note in the Introduction (page 30), containing a letter written to Talleyrand by Madame de Staël in 1809; the original is in the British Museum. I have spoken in my letters to the *Nation* of the first relations of the famous daughter of Necker with Talleyrand, at the time when he was still called the Bishop of Autun. When Talleyrand returned from America, it may be said that Madame de Staël made him Minister of Foreign Affairs, by introducing him to the important men of the Directory. In 1809 she was in exile, the object of the special persecution of Napoleon. Her letter to Talleyrand, written in the interest of her children, is a masterpiece of delicacy, of feeling, and of dignity.

THE SIDON SARCOPHAGI.—I.

WINCHESTER, VA., December 9, 1890.

BEHIND Sidon and Tyre, at the foot of the mountains, there is an almost continuous line of rock-cut tombs. As in Palestine and the country east of the Jordan, so in Phœnicia also, the dead were buried in rock-cut tombs on steep hillsides and along deep watercourses, where the formation of the land allowed caves to be excavated with the least labor. Rich men, however, often built their tombs in their gardens, although this was liable to cause more labor, at least where the surface of the rock was flat. In order to construct the caves in which they used to place the sarcophagi, they were then compelled to sink deep shafts in the solid rock, at the bottom of which they hollowed out their cave-tombs. Tombs of this description are often found in the grain fields and gardens behind the town of Sidon and between that and the mountains. It was in such a tomb to the southeast of Sidon, on the rock plateau just beyond the gardens, that the sarcophagus of King Eshmuna'zar, now in the Louvre, was found. This sarcophagus had been rifled of its contents, removed from the royal tomb, used again, and deposited in a tomb at that point; so it seems. Here it was that Renan excavated, finding a number of tombs, so that

on his map he designates this spot as the necropolis of Sidon. This designation is entirely incorrect, for just as many tombs exist everywhere else behind the town as at Renan's so-called necropolis. The whole surface of the rock plateau above the gardens and below the hills is honeycombed with these tombs, occurring sometimes singly, sometimes in groups. Stone-cutters pursuing their occupation are continually discovering new tombs. They ordinarily rifle them, selling the lamps, bottles, etc., which they find to antiquity-dealers or chance travellers. It was stone-cutters who discovered the tomb containing the sarcophagus of Eshmuna'zar referred to above. The peculiar character of this sarcophagus led them to communicate the find to others, and it was obtained by the Duc de Luynes for the Louvre.

Between three and four years ago a stone-cutter discovered a tomb containing sarcophagi on the edge of the plateau, close to the gardens, about as far to the northeast of the town as was Renan's "necropolis" to the southeast. The peculiar nature of the sarcophagi which he saw led the stone-cutter to inform the American missionaries at Sidon of his discovery, and through their agency, I believe, the fact was communicated to Hamdy Bey, director of the Imperial Museum at Constantinople. This led to his excavations at Sidon in the spring of 1887, and the recovery of those remarkable sarcophagi which are just being thrown open to the public in the new Museum built to receive them in the Turkish capital.

In the winter of 1887-'88 it was reported by telegraph that one of these sarcophagi was the sarcophagus of Alexander the Great. An enterprising New York daily forthwith interviewed a number of savants here and abroad, and devoted much space to a discussion of the subject. After that the matter was allowed to drop, and very little has been heard of the sarcophagi since, except an occasional complaint that Hamdy Bey had not published his results, nor allowed any one to see and study the sarcophagi themselves. In point of fact, he had no place to put them, and they remained in their boxes in the open air, while he was arranging for the erection of a proper building—for which the Sultan gave the money—and superintending its erection. The building is now about completed, the sarcophagi on exhibition, and Hamdy's work on the same making its appearance. The latter is published in *fascicules* by Leroux of Paris. It is to be uniform with Renan's 'Mission en Phénicie,' and abundantly illustrated; for Hamdy Bey is a well-known artist and also an excellent photographer.

I saw the sarcophagi in September and October of this year. They were still in their cases, but I was allowed to examine them as long and as often as I wished to. I shall never forget my first visit. I had just arrived in Constantinople, and had gone to call on Hamdy at the Museum. He proposed to show me the sarcophagi, which were in the lower story of the unfinished new building. He commenced with the sarcophagus of the "Weepers," opening one at a time, and finishing with the great sarcophagus which had been attributed in the telegrams sent to this country to Alexander the Great. I was amazed and utterly carried away; for although I had heard something of the beauty of the sculptures, I was not prepared to find such wonderful art treasures. I had never seen anything to compare with them, and each time I saw them afterwards, the more closely I examined them, the greater the impression. They take their place in the very front rank of the art treasures of the world, and it is worth a long pilgrimage to see and study them.

There are seventeen sarcophagi in all, nine of which are adorned with polychrome sculpture. There were two tombs, one a Phœnician royal tomb practically unviolated, and the other a Greek tomb, all the sarcophagi in which had been broken into and violated. The Phœnician tomb was at a higher level than the Greek. At the time the latter was constructed all knowledge of the existence of the former was lost. The builders sank their shaft and began to cut a chamber into the rock, when the hollow sound warned them that they were penetrating into an older tomb. Accordingly they sank their shaft still deeper, to the unusual depth of forty feet, when they were below the other tomb, and could cut the requisite chambers without breaking into others already existing. Some notice of the discoveries in the Phœnician tomb, and more particularly of the inscribed sarcophagus of Tabnith, the father of the above-mentioned Eshmuna'zar, was published in the *Revue Archéologique* in 1887, the writer erroneously, however, speaking of the Greek tomb as being at a higher level than the Phœnician. The writer of the article, M. Renan, also attributes the Phœnician tomb, and consequently the inscription of Tabnith, to a date at least a century too late. Driver of Oxford does the same thing in his discussion of the early history of the Hebrew alphabet in the introduction to his 'Notes on the Hebrew Text of the Books of Samuel,' assigning it to 300 B. C. Now there is one of the Greek sarcophagi already mentioned, found in the tomb first discovered, which cannot be later than 300 B. C., and, as already stated, at the time when the tomb containing the sarcophagus was constructed, the existence of the neighboring Phœnician royal tomb seems to have passed out of remembrance. There are certain further details which Hamdy Bey feels determine the date of Tabnith approximately, but which I am not at liberty to state. At least, his discovery furnishes conclusive proof that the date of 300 B. C. for Tabnith is too late by a hundred years or more, a result of some importance in Phœnician epigraphy.

The inscription on Tabnith's sarcophagus reads as follows:

"I, Tabnith, priest of Ashtaroth, King of the Sidonians, son of Eshmuna'zar, priest of Ashtaroth, King of the Sidonians, lie in this chest. Thou whosoever findest this chest do not open my tomb (?) nor violate it, for there is no image of silver, nor image of gold, neither any jewels hidden (?). I only lie in this chest; do not open my tomb nor violate it, for that is an abomination unto Ashtaroth; and if thou dost at all open my tomb and violate it, mayest thou have no seed among the living under the sun, nor resting-place among the shades!"

There is something pathetic in the testimony which this inscription affords to the insecurity even of royal tombs. The pains which had been taken to secure the sarcophagus in its chamber bear further testimony of the same character. It was buried in a hole in the rock floor of the chamber, which was filled up with small stones and mortar, and on top of all was a great block of stone about ten feet long and five feet thick. But the pathos of the attempt to preserve this tomb inviolate both by curses and by material means is somewhat marred by the fact that the very sarcophagus in which Tabnith's mummy was found had been stolen from an Egyptian tomb. There are uneffaced Egyptian inscriptions both without and within, from which it appears that this great mummy-shaped stone chest was originally the coffin of a certain Egyptian general named Panephtah. It seems probable that, after the conquest of Egypt by the Persians, many ancient tombs were violated, and that a traffic sprang up in second-hand Egyptian coffins.

The sarcophagus of Eshmuna'zar in the Louvre is an Egyptian stone coffin of the same type as that of Tabnith, a result of the same traffic in funeral spoils. As I have already stated, it was not found in its original condition, nor apparently in its original position. Hamdy Bey is inclined to suppose, with considerable probability, that the tomb of Eshmuna'zar was in the same neighborhood as that of Tabnith. If so, then there is a possibility that the tomb of Tabnith may be a part of a sort of royal necropolis, and that unviolated graves of other kings of Sidon may be discovered hardly less interesting. Last summer stone-cutters ascertained that other tomb-chambers exist close to those already found in the same grain and olive field. Hamdy Bey hopes to be able to excavate those next spring, and we must wish for him at least some part of the remarkable success which attended his excavations in 1887.

In the tomb of Tabnith, besides the chamber containing his own sarcophagus, were other chambers containing uninscribed stone sarcophagi, presumably the coffins of the women of his family. With none of these, so far as I am informed, was found anything of interest, but merely lamps and vases of ordinary forms. These also were transported to Constantinople to form part of the unique collection of sarcophagi which fills the whole lower floor of the new Museum and overflows into the court in front.

JOHN P. PETERS.

Correspondence.

THE SIOUX "WAR."

TO THE EDITOR OF THE NATION:

SIR: To any one who knows all the facts, the present massacres of the Sioux are inexpressibly sad and shocking. The Government makes treaties with the Indians promising them annually certain supplies. The supplies are mainly stolen by the agents, the Indians suffer in body from hunger, and suffer in mind at the thought that they are perfidiously treated. Their case is hopeless, and to any one who studies the matter, it is a very pretty example of like causes producing like results when we see them, in the same situation as the Jews under the Romans, losing all hope of earthly help and turning towards the thought of supernatural deliverance. They quickly adapted the Messiah idea to their own case; the ground was ready for the seed.

It was my fortune to meet the Sioux as hostiles the first time I ever saw them, and our party, outnumbered five times, narrowly escaped a fight that meant, as the mountaineers said, that we should have been "rubbed out." Though I was then but a boy, it was plain to me that we were in the wrong as they charged us—making a new wagon road through their country without their consent by treaty or otherwise—though it took away none of the bitterness as we looked around at the hills with but five minutes more to live, as we believed.

The following year I went to work at Fort Laramie in an old historical building of stone and adobe, as "cub" or store-boy, selling goods to soldiers of the garrison, freighters, and emigrants, and to the Sioux who were all around there. On quiet afternoons a party of Sioux would walk in and sit down wrapped in robes

or blankets and silently smoke and pass the pipe around. Sometimes the silence was broken by discussions on various subjects. The proprietor, my employer, had gone among the Sioux and Cheyennes at the age of sixteen, and raised an Indian family. But the squaw and most of the children were dead, and "Yellow Hair" was a great rich man with a white squaw, and on his rare visits to the place his old friends felt honored to get to shake his hand and say "How."

A frequent subject of conversation was how that the Great Father (President) sends goods for the Sioux, and the agents give them one-tenth and sell the other nine-tenths to the traders, who trade them to the Sioux for peltries instead of giving them. I remember especially one Indian, who came in with his boy and began telling me that he was just back from the *wak-o-pominy*. That meant a free distribution of annuities or presents. He told me he had a squaw and three pappooses, and "This is the share that my whole family got," said he, as he contemptuously stuck his butcher-knife into a big plug of tobac o that looked as if it had been rained on. The Indians said "such a trader"—naming a Frenchman, formerly a trapper—"got one wagon-load of the goods sent us by the Great Father"; such another "got two loads," and so on, "and they traded some to us, and sent others up north to trade to other bands of our tribe."

Differentiation has done as much work among Indians as among whites, and there is not more difference between Crispi and a dago than between Spotted Tail, Little Thunder, Afraid-of-My-Horse (erroneously called Man-Afraid-of-His-Horses), or Red Cloud, or any great Sioux chief, and the dregs of the Kaw tribe, for example. "Yellow Hair," my white employer, said: "I spent the winter of my sixteenth year in a Cheyenne village of two thousand souls, and every woman in it was virtuous. Any one could rely implicitly on the word of every man, and I should like to see the white village of which the same could be said." But he added: "That was before they had met the white men."

There was something so fascinating in the honest straightforwardness of the Sioux, who, *en passant*, call themselves "Lah-kota," that I would have imitated my employer and gone among them as one of them, for I do not see how any impulse can be stronger than was then "the love of vert and venison." But it was plain to me that the wave of white men would sooner or later go over it all, and then I should be like the "squaw-men," neither a white man nor an Indian. While female beauty was not general among them, it was true that Wahziminy, "The-One-Who-Smells-Like-Pine," and Tinggaliska, "The Antelope Fawn," and others, were as handsome as women can be who are not white.

All through the bloody year of 1865, when we were prompted to feel each morning whether our scalps were in place, we could not fairly deny that the danger we were in came from the faults of our own race in their bad faith with Indians. The last lot of Sioux that I saw was Red Cloud and other chiefs and "Strong Hearts," in Cheyenne, en route to Washington. They were as straight as arrows, and as they stood in the streets surrounded by crowds of the curious, they were like so many Sauls, a head and shoulders above any of the white men in town except the Sheriff (an old soldier of Stonewall Jackson's) and two men who are now Senators from Wyoming. I asked one his name, and the words brought back recollections like forgotten dreams; but I could not exactly translate it, and he asked "Lo-lo-wah shnee?" (Don't you know? also meaning, "I don't know.") I could but feel a pang in thinking that such a race had extinction as its certain fate, and that their smooth, beautiful tongue, to them and their neighbors the international and diplomatic language, as French is to the whites, must be lost to comparative philology.

To me there is no dime-novel glamour about Indians to prompt this writing. Two generations back of me in my family there were honorable gentlemen who were Indian agents, a name now almost synonymous with thief. I first saw the light in an Indian agency house, and near that my grandfather lies buried, and at one side of him is an Indian chief who asked that he might rest by the faithful friend of his tribe. I know by heart the Indians' side of the story of the Black Hawk war, from my father, who was a lieutenant in Zachary Taylor's regiment; and he said it was a sickening sight to see the Illinois militia shoot squaws who were trying to swim the Mississippi with pappooses on their backs. "Nits make lice," was Harney's expression when he fell on Little Thunder's band; in more elegant English it means, Kill the children, or you will have to kill them when they are grown.

The soldiers who do the butchering cannot be blamed. When Indians have been starved into desperation and determine and begin to kill all they can, there is nothing to do but to kill them. In somewhat intimate talks with Crook on the plains, I noted how cautiously that "Gray Fox," as the reds called him, avoided, as a soldier, expressing himself against the thieves of the Interior Department who drive the Indians to desperation.

Is there no remedy? Some persons at Fort Laramie were green enough to think that the exposure of the robbery of the Indians would be followed by reformation in the methods of the Administration. They learned that the thieving agent was somebody's brother-in-law, and that if public servants could plunder the white people of millions right under the eyes and nose of the Administration in a hundred ways, then, *a fortiori*, the Indian eel must learn to keep quiet in the skinning. All attempts at exposure and reformation only made powerful enemies for those who tried it. The best thing to do is to read the story of the Roman proconsuls' plundering, and congratulate ourselves that we did not invent the infamy.

Though Big Foot was not one of my acquaintances, his track is familiar by repute. The frontiersmen have told me of seeing it after a disappearance of horses, and that it was as long as the stock of a gun. Studying languages as a pastime, I have learned something of twenty, but not all of them furnish me an expression of my feelings as I think of him butchered in time to keep him from dying of pneumonia. And the pappooses! No people are as kind to their incipient warriors as the Sioux, for they say, "We are raising them to be killed and we must treat them well." Let the man who unquestionably gave assurance that these butcheries might occur with impunity, make a collection of Indian baby scalps as toys for his grandchild, and go to church and listen to the Scripture, "Suffer little children," etc.

It was discovered that by turning the Indians over to the churches, the "Indian problem" would be solved. A certain long-haired bishop thought that if he could lay his hands on Red Cloud's head, he would reduce him to peace when he was at war. A warden of the same church got to be agent under the régime of that religious denomination, and while his agency was in northern Nebraska, he went no further than Fort Laramie, where he industriously played poker, and left his subordinates at the agency to do what is usual in the matter of the Indian appropriations.

And you, gentle reader of a great and scholarly publication, kindly overlook the faults in this article by a writer whose education has been mainly gathered at odd times by himself. Turn your eyes to the plains of Nebraska and South Dakota, where the blizzard is sweeping in resistless fury over the frozen bodies of the red mothers pierced by the bullets from the Hotchkiss and Gatling guns that killed the babies on their backs at the same discharge. They are frozen now, and the wolves are gnawing the breasts of the mothers and tearing off the legs and arms of the children who once sucked them. Not even their Messiah came to help them. Take up your 'Bleak House' and your 'Uncle Tom's Cabin,' and as you read them feel thankful that we are a great and Christian people, and that the party in service is a party of High Moral Ideas.

GEORGE WILSON.

LEXINGTON, Mo., New Year's Day, 1891.

THE PENSION ABUSE.

TO THE EDITOR OF THE NATION:

SIR: Is there any other safe treatment of our general financial interests than the entire repeal of all pension legislation enacted since (say) 1870?

If not speedily done, it seems to me our entire fiscal system must be dangerously modified to procure the necessary revenue, entailing radical changes in commercial, social, and other respects, which on examination will be found inseparable from such change of system. The odious and fraudulent "protective" deception is doomed, as it ought to be, and the danger now is that it may carry down with it even the good and time-honored system of raising revenue by a "tariff for revenue," which in some form has prevailed throughout the national existence. It is improbable that any Congress, with the Western preponderance now fatuously given it for partisan reasons, will venture to restore the easiest-bearing, cheapest-collected, and most lucrative of all taxes, viz., a moderate duty on sugar, coffee, and tea; and without those items no tariff, either for revenue or protection, can long afford the enormous amounts required. Already we see a graduated income tax called for by demagogues to meet the artificial and unnecessary deficiency.

But such a tax, once incorporated into our regular system in time of peace, involves results of far-reaching consequence which it is of the greatest importance should not be lost sight of till too late. It must cause not merely the concealment of capital, but its transfer in large masses to trustees and agents within foreign jurisdictions, and even the acquisition of foreign residence by citizens whose presence, abilities, and capital are important to all classes here. It must also transfer a large part of the traffic in portable securities from American cities to London and other European bourses; and, worse than all for those who prefer or have to live here, it must tend, as intended, to impose the entire burden of the public expenditure on a small number, probably not exceeding 10 per cent. of the population, leaving the remaining 90 per cent. either indifferent to the rate of expenditure or directly interested in its augmentation.

None of these results and other kindred ones that will occur to thoughtful readers, can benefit any class of persons in this country; and yet a graduated income-tax, once fastened

upon our regular system, would probably be harder to remove than any other fiscal blunder, since the exempted 90 per cent. will soon learn to prefer a method which imposes neither inconvenience nor visible burden upon them, and the borrowing States will see no objection to laying the whole burden on the older States that have labored longest and saved most.

If there be any force in the views thus imperfectly sketched, can there be any more pressing public necessity than timely agitation for the repeal of pension abuses which can alone supply a plausible excuse for a graduated or any other income-tax, with its train of half-foreseen mischiefs behind it? Notwithstanding the growing hosts of pensioners, with the Washington lobbyists and their $37,000,000 of realized plunder at their back, there yet remain to set against each at least twenty other voters as yet unsubsidized, and with sympathies considerably modified by the more recent legislative outrages. This condition would seem to offer a fair chance for successful agitation of the subject, if not too long deferred. I. J. W.

PHILADELPHIA, December 31, 1890.

THE PARTY OF INTELLECT AND CULTURE.

TO THE EDITOR OF THE NATION:

SIR: In your notice of Mr. Henry C. Lea's article in the *Atlantic Monthly* on "The Lesson of the Pennsylvania Election," I am somewhat surprised at your remark: "We agree with Mr. Lea in thinking that the [Republican] party contains 'the major portion of the intellect and culture of the land.'" If you had used the past tense, I could agree with you, for during the years when the Democratic party was vainly endeavoring to reconcile the irreconcilable, to adjust the party creed to wild and dangerous propositions and prejudices which seemed likely to command votes with which to grasp power, not only the intellect and the culture, but the plain hard sense of the country was against it.

But parties are made for men, not men for parties. Men are not born into parties as into a caste, or, if they are, they leave one for another if it appears to them that, through the agency of the other, the ends which they believe to be good for the community or selfishly good for themselves may be thereby better subserved. Therefore the lesson of the November election (leaving out of count the result in Pennsylvania) seems to be not so much that men are changing their views of economic principles, or of the proper functions of the general Government, as that they have discovered that they have vainly tried to get them expressed and embodied through one agency, and in vast numbers have gone over to the other.

By way of illustration I add a story told me by a Massachusetts friend (and here condensed to its hurt). It is to the effect that the Ghost of Vice-President Wilson recently visited Senator Hoar and inquired as to the results of the November election in Massachusetts. The Senator gave him the names of those who had been elected as Governor and Congressmen, and told how those who had been defeated had cut down the "normal" majority of their opponents in the way we know. The Ghost was delighted. "And now, Senator," said the Ghost, "tell me who were the Democratic candidates."—Yours, JOSEPH PARRISH.

PHILADELPHIA, January 2, 1891.

MR. RAILTON'S DRAWINGS.

TO THE EDITOR OF THE NATION:

SIR: A very agreeable notice in last week's *Nation* shows that my reference to Mr. Herbert Railton, in an article in the last *Scribner's*, is liable to mislead by seeming to imply condemnation of his work, which I admire. Nothing is better of its kind than his published sketches of picturesque buildings, and he has shown that nobody's hand is surer when there is occasion for rendering architectural form. Allow me to explain that the criticism was of draughtsmen who, having fallen in love with his picturesque touch, can think of nothing else when it comes to subjects that demand a different treatment. Pen drawing is an art in which the manipulation is so conspicuous and so enticing that it constantly draws the attention of the beholder, and of the artist, from the thing to be expressed to the means of expressing it. Here is the danger of following too enthusiastically a favorite example.

W. P. P. LONGFELLOW.

BOSTON, January 5, 1891.

THE MISPLACED *H*.

TO THE EDITOR OF THE NATION:

SIR:

"Chommoda dicebat, si quando commoda vellet
Dicere, et insidias Arrius hinsidias."

Perhaps both Mr. Oliphant and "F. H." would agree in admitting that this bit from Catullus illustrates the chronology and chorology of the "Habused Haitch." Mr. Coote does not strengthen his argument by citing it in his 'Romans in Britain.' The suggestion that 'Arry lurks in Arrius can hardly be such an etymologema as causes Mr. Skeat to "listen in silent shame." A. I.

NEW BEDFORD, MASS., December 30, 1890.

TO THE EDITOR OF THE NATION:

SIR: In general, one gets little profit from any attempts to correct the blunders of the hopelessly ignorant. But the recent letter by "F. H." (*Nation*, December 25, 1890) entitled "*H* Displaced and Misplaced," in which he touches upon Mr. Oliphant's 'New English' and upon the vulgar English wilfulness in foisting everything bad or ignoble in speech upon America, provokes one to an expression of scholarly spleen.

The only thing in "F. H.'s" stricture that surprises me is its extreme modesty. That he, one of the chief readers for Murray's Dictionary, and saturated with English lexicology from the fourteenth century down, should stoop to mention such paltry dates as 1801, 1796, 1793, disconcerts me, in fact. Or is "F. H." keeping back his trump cards? Had he written down boldly "811" instead of "1811," even then he would have fallen short of the mark, for the *haitch* is as old as recorded English speech. The oldest monument is the Epinal Glossary, of which Mr. Sweet, 'Oldest English Texts,' p. 2, asserts, "The MS. may have been written any time between 600 and 700." Turning to this Glossary, word No. 50 (p. 38), we find the Latin *avellanus* glossed *aesil*. The Corpus Glossary (later and differing somewhat in dialect) has *hael* [for *haesl*], and—in another place—*haeselhnutu*. The word is our well-known "hazel," German *hasel*. That the *h* is an organic part of the word is shown by Kluge, in his German Dictionary. Kluge assumes a pre-Germanic **Kaselo*, cognate with Latin *corylus* (*r* from *s* by rhotacism) and old Irish *coll* for *cosl*.

Turning now to Sweet's edition of the 'Pastoral,' printed as long ago as 1871, we read, p. xxxi: "The frequent omission of initial *h* is a remarkable feature of the Pastoral MSS.: *æfdon* [for *hæfdon*, 'they had'] 27^{25}; *æfde* [for *hæfde*, 'I had'] 153^{18}; *is* [for *his*] 43^{17}, etc. The addition of an inorganic *h* is rarer: *his* for *is* 215^{19}, compare *ahebbad* [for *a-ebbad*, 'ebbed away'], *Chronicle*, ed. Earle, p. 95^{33}."

All these examples are from genuine Wessex documents of the ninth century. And see Cosijn, 'Altwestsächsische Grammatik' (erste Hälfte, p. 181).

From the tenth century I cite *animo suo*= *is* [for *his*] *mode*, Kentish Glosses, No. 584 (*Zeitschrift für deutsches Altertum* xxi. 31).

Later MSS. show the *haitch* frequently. Thus An.-S. Minora (*Anglia* xii.) *gif we hit ge-hearnian* [read *earnian*] *willath* p. 514^{28}; *be is* [read *his*] *ge-earnunge* 516^{16}; for *hus* [read *us*] *synfullan* 517^{35}. See also the examples cited by Logemann in his edition of 'The Rule of St. Benet' (E. E. T.), p. lix. § 72. For the fourteenth century we may note in Chaucer *ost* for *host*, 'House of Fame' i. 186; *haboundance* (for *abundance*), 'Fortune,' 29. In the documents of this century, *houre* (for *oure*), *heuery* for *every* (Morsbach, 'Ursprung der Neuenglischen Schriftsprache,' p. 100).

I have gathered only a few examples, such as have lain in my path while hunting for words. No one, to my knowledge, has made especial study of the point, but I am confident that whoever does will be able to multiply examples indefinitely, and make it clear even to the wayfaring man, though a fool, that the English language from the seventh to the nineteenth century has always been lax in its *haitches*. The examples from the Epinal, Pastoral, Chronicle, and Kentish glosses preclude the possibility of assuming Norman influence. J. M. HART.

CORNELL UNIVERSITY, January 3, 1891.

Notes.

MESSRS. CHARLES SCRIBNER'S SONS and Scribner & Welford announce that the branch of their business heretofore conducted under the name of Scribner & Welford will henceforth be carried on under the former name, which will thus include all departments of their business. This change must have been anticipated on the death of the late Charles Welford, whose name the book-lovers of this city may be trusted to cherish without the usual reminder. The Messrs. Scribner have in press 'A Practical Guide to Whist,' by Fisher Ames; 'Talks with Athenian Youths,' five selected dialogues from Plato, newly translated; the annual edition for 1891 of Janvier's 'Mexican Guide'; and the three concluding volumes of Henry Adams's 'History of the United States,' embracing the second Administration of Madison.

'Men *and Women* of the Time' will be the expanded title of the new edition of 'Men of the Time,' to be issued in the spring by Geo. Routledge & Sons.

Macmillan & Co. will publish shortly 'Studies in Literature,' by John Morley, and a new nine-volume edition of the 'Cambridge Shakspere,' revised by W. Aldis Wright.

The Cassell Publishing Co. have nearly ready, in two volumes, T. Wemyss Reid's 'Life, Letters, and Friendships of Richard Monckton Milnes, First Lord Houghton.'

The United States Book Co. will be the American publishers of Dr. Japp's edition of the posthumous works of De Quincey, and of Mr. Edmund Gosse's authorized translation of Ibsen's latest play, "Hedda Gabler."

Unwin Brothers, Little Bridge Street, Ludgate Hill, London, E. C., invite subscriptions to an ordinary and a large-paper limited edition of the 'Collected Sermons of Thomas Fuller, D.D.,' begun by the late lamented John Eglington Bailey, author of the best Life of that worthy, and carried through by Mr. W. E. A. Axon. Each edition will be in two volumes. Many of the sermons are very rare.

Among the publications of the English Folk-Lore Society for 1890 is an interesting and valuable 'Handbook of Folklore,' edited by Mr. G. L. Gomme, Director of the Society. The object of this modest little volume is to give a definition of folklore and directions for its collection. The first chapter attempts to explain what folklore is and to classify it in twenty-one classes, under four general heads: superstitious belief and practice (nine subdivisions); traditional customs (four subdivisions); traditional narratives (four subdivisions); and folk-sayings (three subdivisions). Each of the twenty-one chapters which follow contains a definition of the particular class of folklore treated therein, and a few typical examples "illustrating the way in which the folklorist compares and identifies the beliefs, customs, and traditions of modern ages." Then follows, in most of the chapters, a series of questions (there are 784 in all) for the direction of collectors. In chapter xv., "Folk Tales, Hero Tales, Drolls," Mr. Baring Gould's convenient classification (adapted from J. G. von Hahn) of "story radicals" (seventy classes) is given, and it would be well for future collectors of popular tales to observe this arrangement as far as possible, in order to facilitate reference. In conclusion, three chapters treat of the way to collect folklore, library work, and a sketch of the Folk-Lore Society. In the second of these three chapters an account is given of the elaborate tabulation of folk-tales and customs undertaken by the Society, instalments of which are printed from time to time in the journal of the Society (now published under the name of *Folk-Lore*, a Quarterly Review of Myth, Tradition, Institution, and Custom). Mr. Gomme's book is deserving of wide circulation, and will undoubtedly do much to increase the interest already felt in the subject.

We have received the second annual issue of the 'Public Schools Year-Book' published in London by Swan Sonnenschein & Co. It is edited by three public-school men of Eton, Harrow, and Winchester, and has every mark of system and thoroughness. Some American parents may find their account in the information imparted about preparatory schools, examination papers, admission, studies, charges, scholarships, prizes, etc. The second part, about two-thirds as full as the first part, is wholly given up to athletics; and this may attract our college undergraduates. One of the appendices records and classifies the educational books of the year.

In the 'American Manual of Photography' for 1891 (New York: Scovill & Adams Co.) the most noticeable feature is an interesting collection of twelve portraits of Daguerre. Several of these are from daguerreotypes, and in one case we have both a process print from the somewhat battered original, and Kruell's wood-engraving from the same, properly reversed. The daguerreotype of 1848 has never before been reproduced, and is one of the best of the series.

The exigencies of Boston University, with its mixed classes, have forced Prof. Lindsay, in editing 'The Satires of Juvenal' (American Book Company), to omit whole satires and mutilate others beyond ordinary precedent. Such editions will make us doubt seriously if colleges constructed on the theory of coeducation must not at last consent to strike certain classical authors out of their course altogether, rather than use them in a form which can only lead to a distorted and incorrect notion of their contents. The editor's notes, too, show great absence of proportion. Considerations of text occupy too much room for beginners, while advanced students—and only such ought to attempt the study of Juvenal—will be teased by the most elementary translations and comments. There is the fashionable profusion of pictures, including a reduction of Gérôme's "Circus Maximus"; but Prof. Lindsay's scholarship finds no real chance to show itself under so many hampering conditions.

A good selection of Cicero's letters edited for colleges is such a desideratum that our anticipations were strongly raised by Prof. Montague's 'Selected Letters of Marcus Tullius Cicero' (Philadelphia: Eldredge & Brother); but it is a very disappointing book. The letters are selected almost wholly for their historical importance, and hence some extremely hard ones are given, and given early, while the editor, like too many editors of Cicero's letters, neglects the profusion of short, simple, and easy letters to Tiro and Terentia, which throw no light indeed on Clodius or Cæsar, but form an admirable introduction to epistolary Latin and Cicero's domestic history. The book is loaded with extracts from all sorts of familiar manuals like Forsyth's 'Life of Cicero,' and some very antiquated ones, like Zumpt's Grammar and Leverett's Lexicon. Tedious elementary information about subjunctives, to be found in every grammar, and known to every teacher, fills up space belonging properly to explanation of local and specific difficulties. Obsolete spellings like *otii*, *conticerentur*, are retained; in one place the note assumes *haud* when there is none in the text; and elsewhere the impossible date *A. D ii Kal: Mai:* appears.

M. Édouard Rouveyre, a Parisian publisher, who has already deserved well of all book-lovers for his sumptuous volumes on the fine-art of book-binding, has now begun the issue of a new "Bibliothèque des Connaissances utiles aux Amis des Livres" with a volume on 'Les Ex-libris et les Marques de possession du Livre,' by M. Henri Bouchot (New York: F. W. Christern), which pleasantly supplements the information in Poulet-Malassis's amusing monograph and in the more ponderous book of Mr. Leicester Warren. M. Henri Bouchot points out that the book-plate had its origin in Germany, where the art of book-binding was never cherished, and that in the beginning the book-lovers who were clothing their precious volumes in gilded morocco bearing their arms, emblem, motto or name, scorned the mere paper-label of Teutonic origin. Nowadays, however, every true book-lover has his book-plate, and nowhere is the ingenuity of French taste more advantageously displayed than in the making of these dainty devices. Even in inartistic England, the fancy is spreading; and Mr. Lichtenstein and Mr. Laurence Hutton have already written about American book-plates.

A winter trip to California is coming more and more into vogue with those who can spare the time and money, and the Sandwich Islands, too, are commending themselves as a pleasant and inexpensive excursion from San Francisco. The round trip can now be made for $125, the time required for reaching the islands being a week. This information, with a great deal more of value and interest to travellers, is given in 'The Tourist's Guide through the Hawaiian Islands,' compiled by H. M. Whitney and published by the *Hawaiian Gazette* Company at Honolulu. It contains four maps of the different islands, and twenty illustrations of the finest scenery. In describing the volcanoes, the editor has quoted freely from the writings of others, especially Miss Bird, whose book, though a little out of date, is still the most readable work on Hawaii. Of course, the information given in it as to routes and travel conveniences holds good no longer, and in this respect Mr. Whitney's guide will prove a useful supplement. There are now two regular routes to the volcano of Kilauea. On one of these the tourist is surprised to come across a railway of twenty miles, on which a bye-excursion can be made; and almost as much, on reaching the Volcano House, at finding there a stove, a liberal supply of food, a parlor with easy-chairs, and even a small library. Several pages are devoted to the leper settlement at Molokai.

We lately had occasion to notice the 'Cyclopædia of the Manufactures and Products of the United States' published by the Seeger & Guernsey Co. of this city. The firm have now made a Spanish edition of the work, in which the *indice de los articulos* alone fills nearly a hundred pages. The undertaking is one that makes for peace as the McKinley tariff makes for war. Mr. Cleveland is quoted in a testimonial as saying of this Cyclopædia that "its contents ought to stir the pride of every American, and suggest to him that our industries are no longer infantile." This expression is much within bounds.

With other college catalogues, those of Harvard and Yale come to us, full of significance of the training to be got at either institution, and with interesting differences in the scheme of display. Together with them we receive the Treasurer's report of the Harvard Law School Association, which has made a prodigious growth during the past year, the accessions exceeding the first year's membership as well as the accessions of all the intervening years put together. The Law School's own membership, it appears—very likely *propter hoc*—has kept pace with the increase in the Association, whose total membership is now 1,612; more than half being credited to Massachusetts (643) and New York (222).

Mr. Henry F. Waters's "Genealogical Gleanings in England," in the January issue of the *New England Historical and Genealogical Register*, are divided between Harvard College and Washington. The Hollis family, so conspicuous for munificence among the early benefactors of the College, is here presented in the wills of several generations; and there is a good body of testamentary and other evidence concerning Lawrence Washington the emigrant, which serves to fix the date of his coming over to Virginia. The Washington connection, also, of Sandyses and Spencers is developed at some length with satisfactory results. Mr. John Ward Dean adds his interesting discovery concerning Roger Williams's first love and rejected suit which has been already made known to our readers. The thirty-second paper of the Rev. George M. Bodge's exhaustive researches relative to the "Soldiers in King Philip's War" begins a general review of the events of that war. He thus binds together the several narratives in which the personnel and the fortunes of each company have been set forth.

Those who are interested pro or con in the American origin of 'Mother Goose Melodies' will find in the Boston *Commonwealth* of December 27, 1890, a return to the subject on the part of Mr. W. H. Whitmore, clinching, if possible, his negative argument already elaborated

in his curious volume published by Joel Munsell's Sons in Albany. A letter from the most effective promoter of the American legend, the late William A. Wheeler, is the chief feature of the article.

The second paper on "The Preludes of Harper's Ferry—John Brown, Guerrilla," appears in the *Andover Review* for January. From a note-book of the Kansas period it reproduces memoranda of the effect produced on John Brown by the reading of Stocqueler's Life of Wellington, particularly in what relates to the Peninsular campaign and the operations of the Spanish guerrillas. The rest of the paper is supplementary to Sanborn's narrative in the Life of Brown.

President Gilman of Johns Hopkins opens the new *Educational Review*, edited by Prof. Nicholas Murray Butler (New York: Henry Holt & Co.), with a brief article on the "Shortening of the College Curriculum," mostly in the nature of a summary, but with the suggestion that the beginning of college life be brought back to an earlier age—sixteen for the average student. There are four other leading articles, by William T. Harris, Josiah Royce, Andrew S. Draper, and Charles De Garmo; Discussions, as on coeducation in Boston, the Bennett Law in Wisconsin, etc.; Editorials, and Reviews. The *Review* is attractively printed.

Teachers of the classics and all students of educational systems and methods will be interested in a new German magazine, which the recent widespread discussion of proposed reforms in the curriculum of the gymnasia has called into existence. The quarterly is entitled *Das Humanistische Gymnasium*, and is edited by Director Uhlig of the Heidelberg Gymnasium and published by Carl Winter in Heidelberg, at a yearly subscription of two marks. Dr. Uhlig is known among educationists through his syllabus of the courses of the study in the various German gymnasia and other pedagogical writings, and to Hellenists by his work in the Greek grammarians, in particular his edition of Dionysios Thrax. At the recent educational congress in Berlin he was one of the most prominent figures. The magazine represents in general the cause of gradual and cautious reform of existing institutions as against the proposals of radical change and overthrow. It will contain full reports of current discussions and of educational conferences, as well as original papers by the leading educators of Germany. A remittance of sixty cents will cover subscription and postage.

Petermann's Mitteilungen for December contains the closing part of Prof. Ratzel's summary of the scientific results of the Stanley expedition, and a paper on the rainfall of Europe, Western Asia, and Northern Africa, with four maps showing the amount at each of the four seasons of the year. An interesting indication of the variety and extent of the geographical literature of the past year is given in the index to the notices of books and papers on geographical subjects which have appeared in the scientific serials. The whole number of notices is 2,475, of which 523 are of a general character, including histories of geography and biographies of travellers. Of the remainder, 753 are devoted to Europe alone; Africa having but 408, and America following a close third, with 391. Australia and Polynesia are fourth with 175, and Asia is fifth with only 118. This comparatively small number is probably to be explained, not by lack of interest, but by the difficulties and dangers still attending explorers in the remote regions of that continent. There were sixty notices of works and papers on the oceans, and forty-seven on the Polar regions.

The second winter meeting of the Geological Society of America, recently held in Washington, was an even greater success than the first meeting a year ago in New York. The attendance included representative men from all sections of the country, although the geologists of the National Survey naturally made a large part of the number present. The papers read were generally of excellent quality, and promise a large and valuable volume of bulletins for the coming year. It is difficult to select a few titles from the large number for brief mention; but all who were present must certainly recall with especial interest and pleasure the reports by Mr. Hayes on two peculiarly complex Appalachian overthrusts in Georgia, and by Mr. Russell on his explorations last summer among the mountains and glaciers of Alaska. The summer meeting of the Society will be again in Washington, falling between the sessions of the American Association for the Advancement of Science and the International Geological Congress.

Mr. A. F. Ernst writes to us from Watertown, Wis., of a recent controversy in these columns: "You allow the Missouri Lutherans to be attacked in the *Nation* in a manner so incorrect and unjust that I must believe 'Andover' to be a personal enemy of them. And your readers must believe that the Missourians are the Lutherans. That is all wrong. In our Central Committee, consisting of fifteen members, there were just two so-called Missourians; and though they helped us as much as all the rest, they neither led nor originated the movement."

A serious typographical error made us say last week that the annual fee of membership in the American Dialect Society is ten dollars, whereas it is but one dollar. The Secretary's address, we will repeat, is Mr. E. S. Sheldon, No. 27 Hurlbut Street, Cambridge, Mass. In the same unlucky paragraph, "biographies" was printed for "bibliographies."

—The *Atlantic* opens the year with a light travel-paper, the first of a series, describing the journey of the author, Mr. Percival Lowell, to Noto, an outlying province of Japan. The present sketch does not take him to his destination, but narrates the incidents of the way, and paints the scenery with that delight in the people and the country which is the common charm of all who are now writing on the subject. Mr. Lowell differs from the rest mainly by putting more of himself into the page and never being dull, though it must be said that his intellectual vivacity or nimble-mindedness sometimes becomes acrobatic. The remainder of the number is somewhat heavily packed with serious matter. Two articles upon education are of interest, but particularly the plea, by Cleveland Abbe, for courses in terrestrial physics in the universities. The state of our knowledge about the subject is set forth and the lines of immediate investigation are pointed out, with so much detail that the paper is really of the sort usually found in scientific periodicals. Prof. Royce's account of Hegel is also a novel topic, out of the common course of the general reader's opportunities to enrich his knowledge; but it cannot be said that the expositor has succeeded in bringing Hegel within the reach of popular comprehension—he is as obstinately metaphysical and recondite as ever. There are two political articles, one on Boulangism, the other on the lesson of the recent election in Pennsylvania, by Mr. Henry C. Lea, on which we commented last week. A very thoughtful examination of the means by which the State may exert some control over railway-strikes and other labor contests is contributed by Mr. Charles Worcester Clark, whose discussions of public questions we have before had occasion to recommend to our readers. The temperateness of the view taken is, in this as in the other instances, a striking characteristic. His discussion of the penalties to be imposed in case of the rejection of arbitration is perhaps the most suggestive, as it certainly is the most difficult, part of the paper.

—The *Century* brings the long-awaited Talleyrand memoirs in the rather unsatisfactory shape of excerpts. Minister Reid furnishes an introduction, which is not a remarkable performance. The memoirs themselves, in this instalment, deal with Talleyrand's childhood, and part of his life through the time of his visit to America. The principal persons especially mentioned are the Duke of Orleans and Alexander Hamilton. The disjointedness of the paper, however, with its parenthetical notices of what is omitted, is unfortunate and vexatious to the reader; but whether the lack of vigor in the personal impression of Talleyrand is due to this cause is uncertain. It seems clear that the writer has passed over some of the salient points of his career with silence. The running comment on public policy and on his own principles of action are the most interesting portions, but the lack of portraiture and narrative is noticeable. It appears likely, however, that these memoirs will be an advantage to Talleyrand's historical reputation. We must not pass over the shocking English of the translation, which is not only ungrammatical and slipshod, but full of French idioms and phrases often quite unintelligible. What, for instance, does this mean? "She desired M. de Mercy to oppose the appointment of a French cardinal before the *promotion of the crowns. . . . Since then, my cardinal's hat is likely to have spent a few years in French fortresses.*" The second main subject in the number is California, which is the occasion of two articles and several pieces of ana. The Thibetan journey goes on, with no great vivacity in this chapter, among the Mongols of the Azure Lake. Octave Thanet contributes a very interesting picture of the Irish famine from the papers of an "Irish gentlewoman"; and not altogether out of harmony with this is the sketch of the estates and country houses of the planters of the Lower James, with some historically valuable cuts of architecture and interiors. A fine portrait of Saint-Gaudens by Kenyon Cox is the artistic feature of the number, and with it goes a eulogistic sketch of the painter. The war is represented by a well-joined block of reminiscences of "Morgan's Rough Riders" by participants in the events narrated.

—Mr. Gosse writes in the *Forum* of the probable future of poetry; and though the question has been much debated, he restates some phases of it with cleverness. He disabuses the reader at once of the notion that popular interest in verse is any sign of present excellence or future productivity. A great genius may be unnoticed by his contemporaries, and, on the other hand, many an inferior writer has been the laureate of the age. The really new condition in the present is obviously the competition which our poets are forced to bear from the whole body of the dead. Until within the last half-century, the public read the writers of its time; but the antiquarian interest that has resulted in supplying us with editions of the poets of every English reign, and countless volumes of selections, has made

the struggle of new writers for recognition more difficult than in the case of the Elizabethans, the eighteenth-century poets, or even the Romanticists of this century. Mr. Gosse foretells a reaction and a coming intolerance of these older works; but, on his own theory that recognition does not affect the appearance of original genius, this wider competition should have no effect, except by discouraging new poets, and discouragement has frequently given the true poet only a sweeter and more piercing note. In forecasting the probable course of the verse of the next age, Mr. Gosse intimates that it will succeed more by matter than manner, that it will take the form of narrative in highly developed rhyme and music, discarding blank verse; that it will revive the drama (a dream which others indulge, and which will come true if it is held long enough); and that it will be "very bare and direct, unembroidered, perhaps even arid in character," and "experimental rather than descriptive, human rather than animal." He does not look for any reversion to didacticism, but nevertheless holds that there is much in the gathered stores of modern knowledge that issues in spiritual moods, and in hopes and fears for which only poetry can provide expression; and he anticipates a special characteristic impressed by the democratic social movement. He is, after all, an interested rather than inspired prophet, and deals with the convenient may-be, not the shall-be of thorough conviction. Meanwhile the muse keeps her counsel, with quite the taciturnity of nature, according to her ancient wont.

—The movement for "university extension" marks the progress of the democratic ideal in education. An indication of the vigor of this movement in America comes to us in the Constitution and Circular of the "University and School Extension." This association, a sort of Chautauqua of higher grade, designs "to supplement and to strengthen the university and the school systems; to increase the culture and to promote the interests of teachers as members of a profession; and to advance and extend the knowledge of letters and of the arts and sciences." The Executive Committee of the University Extension Faculty consists of Presidents Dwight, Patton, and Low; Dr. W. T. Harris, United States Commissioner of Education; Norman A. Calkins, and Seth T. Stewart. The President of the Board of Directors is James W. Alexander, representing Princeton College; and the Vice-Presidents are Chauncey M. Depew, representing Yale; Charles S. Fairchild, Harvard; and W. Bayard Cutting, Columbia. The Society aims to be national in character. State and local societies are to be formed as auxiliaries. The constitution provides that "the Faculty of the University Extension shall consist of a president and professors appointed by him from the universities and colleges in the several States, on the nomination of their respective presidents, and, if deemed expedient, from among prominent specialists not professors of colleges. The four institutions [Harvard, Yale, Princeton, and Columbia] represented in the first organization of the University Extension shall be entitled to equal representation, and each State shall be entitled to at least one member in the Faculty." The means of instruction are "outlines for courses of study, class instruction, courses of lectures, correspondence, examinations, etc." Syllabuses have already been prepared in Language, English Literature, History, and Science. Among the specialists who have prepared these outlines are Profs. Child, Macvane, Kittredge, and Shaler of Harvard; Ladd, Peck, and Seymour of Yale; Young of Princeton, and Theodore Dwight of Columbia. Other syllabuses are in process of publication.

—What the English have done in this direction has been told in the address recently given in Washington and Boston by Prof. R. G. Moulton of the University of Cambridge. Prof. Moulton, we believe, is one of the committee appointed by that university, in connection with Oxford, to have charge of this work, and, having given nearly all his time to it for fifteen years, not only as manager, but directly as lecturer, believes enthusiastically in its value, both as bringing learning within reach of the hundreds or thousands of adults already longing for it, and in spreading among a larger class a knowledge of possibilities in the way of education of which they had no idea; and, above all, for the reflex action upon the teaching body of the universities derived from their vicarious contact with the people through the university lecturers. Then, if we consider lectures as a means of education rather than of amusement, the superiority of the English system as compared with our so-called lyceum lectures is obvious. Again, a most important feature is that each course (of twelve lectures) is given to one subject—not Tennyson this week, Astronomy next, and Nihilism after that. As compared even with course lectures, such as those of the Lowell Institute, in this country, the English system has great advantages, first, in the application of the principle that the lecturer's business is not to give instruction (this being done by authorities named in the printed syllabus of the course), but to create or to stimulate the desire to learn; and, by means of the hour "class" held before the lecture, to exert personal influence and, incidentally, to get at the particular wants of the audience.

—A valuable aid to the student of modern German literature is Max Koch's select edition of Karl Immermann's 'Werke' in four volumes (Stuttgart: Spemann, 1890), issued as numbers 159 and 160 of Kürschner's "Deutsche Nationalliteratur." Immermann was unquestionably a poet of superior, although essentially imitative, talent. His dramas, even when they represent scenes from contemporary life, are all patterned after some model—Shakspere, Calderon, Goethe, Schiller, or other typical author, whom he happened to be studying; as reading they are not especially animating, and have proved utterly ineffective on the stage. The same holds true, in a great measure, of his imaginative prose writings. The influence of 'Wilhelm Meister' is traceable on every page of 'Die Epigonen,' which, in turn, had sufficient vitality and plastic force in it to inspire and shape the earlier romances of Gutzkow, Freytag, and Spielhagen. The only production of Immermann's that is an independent and really original creation is 'Münchhausen,' the best part of which, and indeed the only part that can be enjoyed and fully appreciated by the reader of to-day, is the charming episode of Westphalian peasant life, now published separately under the title of 'Der Oberhof.' 'Münchhausen' proper is not only the persiflage of an impecunious and unprincipled *Junkerthum* or squirarchy, but also a satire on all the social, political, and literary tendencies of the time, in caricaturing which the author enters into details familiar only to a few of his contemporaries, and utterly forgotten by the present generation. Dr. Max Koch, in his annotations to 'Münchhausen,' has taken great pains to follow out and explain the drift of these obscure allusions, and has thus provided the work with a commentary which in fulness and accuracy leaves nothing to be desired. It is a monument of literary industry; whether the game was worth the candle or not is another question. It is certain, however, that no one who wishes nowadays to read 'Münchhausen' and understand it, can do so without Koch's edition.

NICOLAY AND HAY'S LINCOLN.—II.

Abraham Lincoln: A History. By John G. Nicolay and John Hay. 10 vols. 8vo. New York: The Century Co.

In military matters the cautious but steady progress of Mr. Lincoln towards asserting himself was interestingly marked. He evidently began with the idea that the art and mystery of military strategy was the result of long and laborious education. But contact with Scott and McDowell and McClellan and Meigs and Franklin soon taught him that its professors widely differed among themselves. He read authoritative treatises, and found that nothing over which so much noise has been made is in fact so simple. To know where your enemy is, how strong he is, and to learn the theatre of operations as if you had lived in it and hunted over it from childhood—these are the elements out of which a courageous heart and cool head solves the rest of the problem by striking your *forte* against his *faible*. By the opening of 1862 he thoroughly understood this, and never forgot it. His criticisms of his generals in the Virginia campaigns go straight to the mark. They pierce through all assumptions of unuttered military wisdom and mysterious plan. His letter to McClellan giving details of a proposed movement from Antietam in October, 1862, showed that he was as familiar with the mountain gaps of Virginia as with the street-crossings around the White House. It simply demonstrated the success of the movement if it were pushed with vigor. Indeed, it was the fashion, before it was known that Lincoln was its author, to argue, in certain circles, that its excellence proved the singular capacity of McClellan as a general and the singular incapacity of the Administration that removed him. We now know that Lincoln resolved on the removal because the plan was not executed as it demonstrably might have been.

In dealing with matters at a distance the President sometimes misjudged; but no worse than Halleck and his other advisers. Few people could make a very good guess at the distance, say, from Calcutta to Hong Kong in a straight line. We are used to maps of foreign parts on a small scale, and we have no ready unit of measurement when we think of the few inches on the map. The authorities at Washington in the fall of 1863 seemed to think Burnside could move from the Watauga River on the confines of East Tennessee and Virginia to Chattanooga, or that Sherman could march from Memphis to Rosecrans's assistance, with about the same ease that a division could march from Washington to Bull Run or to the Rappahannock at furthest. Few were willing to make the effort to learn what breadth of country and what mountain chains and rivers lay within the scope of the little space they covered on the common map. Indeed, we may doubt if such an effort is ever thoroughly made by anybody less painstaking than an officer of the German General Staff. It was not strange, then, that Mr. Lincoln should sometimes slip on the topography of distant regions. He was equal to any one about him in his comprehension of the military

problem and the proper methods, in general, for its solution.

In reading the history of the time we cannot help wishing that Mr. Lincoln had sometimes put his military suggestions in the form of imperative orders. He so often and so plainly pointed out the right thing to do, that the command to do it was the only appropriate conclusion for the despatch. Halleck was less suggestive and more unwilling to assume responsibility than the President. His maxim that a general in command of an army must not be ordered to move or to attack, was the cause of many a fiasco. When Longstreet was going to reinforce Bragg in September, 1863, and Meade was unwilling to attack Lee's reduced forces unless ordered to do so, not to give the order was to abdicate the position of general-in-chief of the army. Mr. Lincoln might well hesitate to command when he found Halleck so set against it, but he was sometimes forced to intervene peremptorily, and the fullest knowledge of the facts which we can now get justifies the wish that he had done so oftener. After the progress of the war had developed in Grant, Sherman, and Sheridan commanders whose energy needed no prompting, Mr. Lincoln showed his modest self-poise by withdrawing from active effort to influence their action; but from first to last his grasp of the military situation was quite as clear and strong as that of any of his professional advisers.

In dealing with his generals in high command, Mr. Lincoln was patient, sympathetic, and free (too free, if anything) from the assumption of power or control. He saw the weaknesses of men, and was tolerant of them because he doubted whether things would be bettered by change in commanders. No one ever acted more constantly upon the rule that it is "better to bear the ills we have than fly to others that we know not of." With this was curiously blended a deference to assumed public opinion, in the army or in the country, which sometimes looked like want of proper self-confidence. There was no need of removing McDowell after the first battle of Bull Run. Scott was still general-in-chief, and everybody now knows, what the President then knew, that the tactical handling of the army on the field had been good and the disaster was not the fault of McDowell. A brief proclamation saying so, and appealing to the people to be patient, would, as it now looks, have been met with an encouraging response. In a similar way, after the second defeat on that field, he knew and declared that Pope had done all that could be expected of him. It was understood that Halleck was to take the field with McClellan and Pope as his immediate subordinates when the Army of the Potomac landed at Alexandria. A Presidential command was needed to overcome Halleck's inertia. Had it been given, the services of both the younger men might have been continued to the advantage of the country. But though Mr. Lincoln gave to Pope a strong written approval of what he had done, a popular clamor was supposed to make a necessity for retiring him from active service. It looks again as if Mr. Lincoln had underestimated the influence he could exert upon public opinion by taking the country into his confidence through a few earnest words.

In dealing with those in high command, he had not only been personally kind and patient, he had ignored political preferences and party politics. In making subordinate military appointments and promotions, he did not disguise the fact that political influences were powerful. An example which his biographers have brought into renewed prominence by their effort to prove him always ideally right, is typical, not only of his methods and his standpoint, but also, we are sorry to say, of the manner in which Messrs. Nicolay and Hay deal with facts when they stand in the way of their theory. The case is that of Gen. Sherman's celebrated protest against certain promotions made in his army, during the Atlanta campaign, without consulting him.

The biographers say: (1.) That Sherman "regarded Washington with whimsical horror as a sink of corruption and iniquity, and thought that no good could come out of it." (2.) "This prepossession sometimes had ludicrous results," *e. g.*, (3.) Osterhaus was made a major-general, and Sherman wrote on July 25 an angry despatch to Washington saying, "If the rear be the post of honor, then we had better all change front on Washington." (4.) "This despatch was shown to the President, who, instead of resenting its tone of disrespect and insubordination, wrote in his kindliest and calmest manner a letter to Gen. Sherman, in which he informed him that the promotion of Osterhaus had been made upon written recommendations from no less trustworthy sources than Gens. Grant and Sherman," *i. e.*, at the close of the Vicksburg campaign of the preceding year. (5.) That these recommendations had "somewhat faded" from Sherman's mind. (6.) That Sherman "frankly acknowledged his error, and repeats in his Memoirs that he was 'fairly caught.'" (7.) That "the Government bore him no malice for this incident. They continued to comply heartily with every request he made." (8.) "They even offered him, voluntarily, eight promotions to the grade of brigadier-general to be distributed on his recommendation among the most meritorious colonels of his command." (9.) "It is curiously characteristic of the General that in his Memoirs he attributes this proof of signal favor to the Osterhaus letter."

We must examine a little in detail this "curiously characteristic" statement.

(1.) Sherman had advised Halleck and Grant that the vicinity of Washington was a perilous place for a general because of the facility for intrigues by subordinates and by the political "influences" there. The experience of McClellan, Burnside, Hooker, and Meade had, each in turn, demonstrated it, and every writer of history, including the biographers, had noted it. The "whimsical horror" must therefore be put in the category of rhetorical depreciation for the sake of making the rest of the case easier.

(2.) The present case could only be "ludicrous" to those who have no glimmering of the conditions of good military administration. To others it has been the reverse.

(3.) There were two brigadiers promoted, not one. Sherman's Memoirs say they were "Generals Osterhaus and Alvan P. Hovey." Sherman's reason, which he repeated in his despatch to the President of July 27, was that "they had gone to the rear—the one (Hovey) offended because I could not unite in the same division five infantry and five cavalry regiments, and the other (Osterhaus) for temporary sickness." The "offended" officer had, of course, either asked to be relieved or tendered his resignation, and the papers were officially forwarded to Washington. The omission of the graver case by the biographers tends to belittle Sherman's position.

(4.) The despatch was addressed to Col. Hardie, Inspector-General, and Sherman had no idea that the President would see it, or know more of it than that he regarded the promotions as "an act of injustice to officers who stand by their posts in the day of danger."

(5.) Sherman had not forgotten his former recommendations of these or others. There were recommendations for promotion dating from Vicksburg, not only, but from Stone's River, Chickamauga, Missionary Ridge, Knoxville, that were not acted upon. The time and circumstances of the selection made the cause of complaint. It was, or ought to have been, an understood condition of promotion, under old recommendations, that there should be continued meritorious conduct down to the time of confirming the new grade. Sherman's complaint was that the case was the opposite of this. He knew, too (what the biographers are too familiar with the War Department records to have overlooked), that at that very time captains and lieutenants were being summarily dismissed the army for tendering their resignations when their commands were in the presence of the enemy.

(6.) Sherman confessed no error in the matter. He simply assured Mr. Lincoln that the despatch was not meant for his eye, and that he had loyal confidence in the President. On the other hand, he repeated, in more measured phrase, every assertion he had made, and said to Mr. Lincoln himself: "I do think you will admit that their promotion . . . was enough to occasion disappointment." The words "fairly caught" in his Memoirs only "fairly" mean that his sense of humor recognized Mr. Lincoln's good-natured and "characteristic" use of the adroit *argumentum ad hominem*.

(7.) Mr. Lincoln was far too clear-sighted and just to "bear malice" when the error was his own. His answer to Sherman (which is not given in the History) confessed that he felt obliged to make military promotions under political "influences." It was a formal apology for what he had done, and we honor his memory best by earnestly believing that he laid the lesson to heart with the teachableness that we admire so much in him. His biographers do not seem to appreciate the facts they narrate; for they themselves, in another place, have repeated the rather hackneyed but always successful jest about the boy throwing a stone at random in Washington city and hitting three brigadiers seeking promotion, when it was not a very good day in Washington for brigadiers, either.

(8.) When the eight promotions of colonels were put at the nomination of Sherman, he named them on the recommendation of division, corps, and army commanders, for gallant and meritorious services in the campaign; and in his Memoirs he emphasizes the advantage to the army of making promotions in this way and not the other. It must not be forgotten, however, that the Administration did *not*, with these, offer him, "voluntarily" or otherwise, any promotions to the rank of major-general; those had been already disposed of, as we have seen.

(9.) The connection between the correspondence and the authority to name eight colonels for promotion is this: The despatches were all telegraphic. Sherman's protest to Col. Hardie was dated July 25, 1863; Mr. Lincoln's answer is dated 26th; Sherman's reply is dated 27th; and the authority to promote is dated 28th. We believe the biographers will stand alone in imputing it to vanity in Sherman that he connected the action of the 28th with the correspondence of the 25th, 26th, and 27th.

It would be very difficult, in so narrow a compass, to find so many examples of what history ought not to be. It might well serve

as a *Seminar* exercise for university students testing history, according to modern methods, in original sources. We are obliged, however, to repeat that it is typical. There is hardly a prominent name of the great war period that is not subjected to a similar process of belittling by innuendo, and of condemning by half-statement or by distorted statement of facts. Seward, Chase, Stanton, Bates, the Blairs, Wade, Winter Davis, Greeley, all foremost men in the Administration party, suffer in this way. Their moments of weakness are made the criterion of their characters, and the anecdotes which put them in an unfavorable light are those by which we are asked to judge. This depreciation is systematic and persistent. Each is treated to perfunctory praise for patriotism and ability, and each in turn is pictured in the concrete as unworthy of the praise. It would often be as easy to expose the injustice of this as in the example of Sherman. It will, of course, be gradually done. The epoch was too important, and the interest of the country in her foremost citizens is too great, to let any partial view stand for the history of the time. The thing chiefly to be regretted is that Lincoln, who needs no such belittling of others to stand as the central figure among his contemporaries, should have his memory thus linked to any wrong to them.

This criticism applies only to what may be called Lincoln's personal relations to other men. Frequently recurring as such passages are, they are a small part of the book. The great current of events, both civil and military, is pictured with vividness and with success. The standpoint of a writer must always affect his view, but, in the general way of which we are now speaking, the estimate of events and of men, of campaigns and of generals, is fair and able. No one who has strong and well-defined opinions will find his views always in accord with the writers, but he will differ no oftener than he would with any other historians.

In trying to picture Mr. Lincoln as he lived, the modern methods of physical portraiture come happily in to give satisfaction to our realistic tendencies. The publishers have provided a dozen excellent reproductions of photographs, of paintings, and of statuary. The invention of Daguerre often gives us a hardened caricature of a man with no soul in it. Such photographs are worse than death-masks. But the hardest subject is sometimes caught in happy moments, and out of vast numbers of repellent pictures we may find some that help us to understand the person. Among these of Mr. Lincoln several help us to see the wisdom and the charity, the shrewdness and the friendliness, the clear intellect and the latent will that inhabited his homely form. The frontispiece to the first volume is a satisfactory presentation of the man that was nominated in 1860. The life-mask taken at the same time is strong, with grave prophecy in its lines of the statesman grappling with his task. The picture taken from the photograph of the group in front of McClellan's tent at Antietam shows him towering, like Saul, above other men, while it is thoroughly characteristic in its pose and its slight stoop. The sitting picture of Lincoln and his son "Tad," with its not ungraceful repose and its unconscious dignity, appeals to everybody. The life-mask of 1865 is strong and pathetic, showing a great man who in four years has passed from iron vigor to waning age, but still fit to be the Nestor of his people.

The illustrations have been judiciously restricted to portraits of men who have some prominence in the narrative, very few of any other sort being retained. They make a gallery worthy of study as types of race and character, apart from their connection with the story.

TREES OF NORTH AMERICA.

The Silva of North America; a Description of the Trees which Grow naturally in North America, exclusive of Mexico. By Charles Sprague Sargent, Director of the Arnold Arboretum of Harvard University. Illustrated with figures and analyses drawn from nature by Charles Edward Faxon, and engraved by Philibert and Eugène Picart. Volume I. Magnoliaceæ–Ilicineæ. Boston: Houghton, Mifflin & Co. 1890. Large quarto, pp. ix., 119, tt. 50.

MICHAUX published his 'Histoire des Arbres Forestiers de l'Amérique Septentrionale' in 1810–13. The work was in three quarto volumes, and contained one hundred and forty-five colored plates, while the number of species of trees described was one hundred and fifty-five. Some years later an English translation was published at Philadelphia; and three additional volumes by Thomas Nuttall contained one hundred and twenty-two plates, with descriptions of nearly as many trees, some of them from Florida and others from the Rocky Mountain region and the Pacific Coast. There was a still later edition also. These books, with Emerson's 'Trees of Massachusetts,' were for many years the chief available works for the student of American trees; for Lambert's magnificent 'Description of the Genus Pinus' is so rare and costly that few Americans have ever even seen it. Government reports have described some of the trees of the Pacific Coast, and the various Floras of different sections of the country have given brief accounts of the trees of their respective districts; but there was no systematic account of the whole silva of the United States, no one work in which one could find figured and described the sequoias of California, the hickories of the East, and the palms of Florida.

Prof. Sargent was charged with the task of making a report on the forests of North America for the Tenth Census. To do this he visited all portions of the country, collecting specimens of all the trees he could find—leaves, flowers, fruit, wood, and bark—and making notes on their habit, distribution, uses, cultivation, abundance, and destruction. He also availed himself of the observations and collections made by many able assistants and correspondents. His report forms the ninth volume of the final report on the Tenth Census. He found not less than four hundred and twelve different kinds of woody plants which attain the dignity of trees. After enumerating them, with full references to their bibliography, he gave tables of the specific gravity, and of the resistance to compression and transverse strains of the different kinds of wood, and concluded with a review of the economic aspects of the forests of the United States.

Having finished this work for the nation, he has now undertaken to provide a complete botanical account of all the native trees of the United States and British America. Apart from his other qualifications for this work—and these all botanists know are of a very high order—his long experience as Director of the Arnold Arboretum and his work in preparing his census report have made him preëminently the proper person to write the long-needed new North American Silva. In the choice of an artist to illustrate his work, he has been very fortunate. Mr. Faxon's drawings of ferns in 'The Ferns of North America,' some ten years ago, were highly appreciated, and it is now evident that he has so far perfected himself as a botanical draughtsman that he may be fairly considered in this regard the peer of Sprague and Fitch. His work in the present volume compares favorably with that of Latour and Vivian in the 'Flora Javæ.' If a little stiffness is now and then perceptible in his drawings, it is more than counterbalanced by the accuracy of the abundant details of structure which accompany all the plates. Under the direction of the celebrated Riocreux Mr. Faxon's drawings have been engraved with sympathetic care and artistic nicety, and the result is worthy of the highest praise.

The publishers' circular puts the number of trees to be described in this work at 422, indicating an addition of ten species since the census report was printed. We are informed that Mr. Faxon has already finished the drawings for the entire work, 600 in all, having devoted the last eight years to the task. The engravings for three volumes are already made, and it is the purpose of the publishers to issue two volumes a year until the whole work, consisting of twelve volumes, is completed. When this is done, the silva of no other country will have been so amply described as ours. Perhaps the second place in this respect will belong to New Zealand, for the Colonial Government has recently published a sumptuous folio volume on the forest-flora of those islands. But the 142 plates of that work, though carefully drawn, are only lithographs, and cannot be compared to these excellent copper-plate engravings. Dr. T. Kirk, the writer of the New Zealand 'Forest-flora,' it may be said in passing, has not confined himself to a botanical account of each species, but has devoted much space to the various economic uses of each kind of tree.

The first volume of the 'Silva of North America' contains the descriptions and illustrations of thirty-four trees, beginning with the genus *Magnolia*, and following the usual sequence of natural orders through the holly family (*Ilicineæ*). Out of the twenty known species of magnolia, six are found in the United States, two in Mexico, and the rest are natives of Asia. One of the finest of them all is the Himalayan *Magnolia Campbellii*, which is figured in Hooker and Cathcart's 'Illustrations of Himalayan Plants.' This tree is often eighty feet high, and has a trunk four or five feet thick; the leaves are large, but deciduous, and the great flowers vary in color from white to deep rose-color or almost crimson; they open all over the branchlets in April, while the tree is yet leafless. Our own great magnolia is scarcely less in stature, and has thick and shining evergreen leaves and "deliciously fragrant creamy-white flowers seven or eight inches across when fully expanded," so that it is a question which of the two species is the finest of the genus. The six North American species are given by Prof. Sargent as *Magnolia fœtida*, *M. glauca*, *M. acuminata*, *M. macrophylla*, *M. tripetala*, and *M. Fraseri*.

The first name is proposed instead of *M. grandiflora*, by which designation the most beautiful tree of the Southern States has been known since 1762. Botanists of conservative views in regard to nomenclature, and all persons of good taste who are not botanists, must regard it as singularly unfortunate that Prof. Sargent should feel it necessary to reject a name so fitting and so long recognized as *grandiflora*, and substitute for it the inappropriate and unseemly appellation *fœtida*. His reasons for the change were given in *Garden and Forest*, ii., p. 615. It seems that Linnæus at first supposed all our magnolias to be of one species, and to that he gave the name of

M. Virginiana, describing the several forms as varieties, and this tree was called *M. Virginiana, var. fœtida*, in 'Species Plantarum,' ed. i. (1753). Nine or ten years later, when the great Swedish botanist had learned more about American trees, he distinguished four kinds of magnolia as species, naming them *M. grandiflora*, *M. glauca*, *M. acuminata*, and *M. tripetala*, dropping the name *Virginiana* altogether, and substituting for the first of his newly recognized species the name *grandiflora*, as being more suitable than *fœtida*. It is now claimed that having once uttered in print the word *fœtida*, Linnæus could never recall it, even though it was proposed as the epithet of a supposed variety, and not as the name of a species! This is enforcing the modern law of priority with a vengeance, and gives it a retroactive effect which our national Constitution denies to civil and criminal law. Linnæus seems to have confessed that in ignorance he had used an ill-chosen expression, for he replaced it by an unobjectionable name. Is it not reasonable to accept his implied apology and adopt the amendment? Surely the great majority of well-advised naturalists will say yes, and this almost peerless tree shall still have an honorable name in botanical science. Even to meet the distinguished author of this book on his own ground, which is "the method which imposes on a plant . . . the oldest specific name used by Linnæus in the first edition of his 'Species Plantarum,' or by any subsequent author," it is pertinent to object that Linnæus did not employ this offensive word as a specific name, and to ask why the Linnæan specific name *Virginiana* was not used for some one of the species which it at first included.

The sweet bay (*Magnolia glauca*) extends its range further to the northeast than any other American species of the genus, for it has long been known in a certain swamp in Gloucester, Mass.; and although the trees are fast being destroyed or removed into gardens, yet we learn from Prof. Robinson that there are still one or two less accessible swamps in Essex County where the tree grows in comparative security.

Next to the magnolias comes the tulip-tree (*Liriodendron Tulipifera*), one of the three largest trees of the forests of the Atlantic States. As *Magnolia* is a genus common to Eastern North America and Eastern Asia, so *Liriodendron* occurs in China as well as in the United States. But in this case the identity is specific, for it is our own tulip-tree that gives its shade to the Celestials. This genus, though now monotypic, was represented during the Cretaceous age by several species, both in America and in Europe. More than a dozen of the ancient tulip-trees are described by palæophytologists, and it seems strange that while none survive in Europe, a solitary species should exist to-day in such widely separated lands as China and our eastern coast. Mr. Theodor Holm of Washington has very recently printed in the 'Proceedings of the National Museum' some "Notes on the Leaves of Liriodendron," in which he endeavors to ascertain what was the form of leaf of the archetypal tulip-tree. Confessing the difficulty of coming to any conclusion, he is "not unwilling to suppose" that it was oblong or acuminate, and not very unlike the magnolia pattern. He also discusses the variation in shape of the leaves of the existing species, and compares the definitions given by different authors. He considers the four-lobed leaf the normal form, but mentions and figures leaves with two, six, and even eight lobes or teeth. In the 'Silva' only the normal four-lobed leaves are described, and no mention is made of the variant forms which may be found growing together on any good-sized tulip-tree; and yet, curiously enough, the specimen from which Mr. Faxon's fine drawing was made has leaves with an extra lobe or tooth on each side.

The papaw of the Middle States (*Asimina triloba*) and the pond-apple of Florida (*Anona glabra*) are the representatives of the custard-apple family, a family much more numerous in tropical countries than in our own. The fruit of our papaw is said to be edible, and at times even sweet and luscious; that of the pond-apple is insipid, though slightly aromatic. Two more Floridian wanderers from the tropics follow next, the Jamaican *Capparis*, and the wild cinnamon (*Canella alba*), the bark of which is used in medicine. Next are the two arborescent species of *Gordonia*, a genus not far from *Camellia* in botanical characters, and somewhat resembling it in general appearance. The loblolly bay (*Gordonia Lasianthus*) is common enough in Southern swamps, but will scarcely live north of Philadelphia. The other species (*Gordonia Altamaha*, or *G. pubescens*, as it has been more commonly called) is one of the few American trees, perhaps the only one, which is now unknown in a wild state, for though it is sometimes found in cultivation, both in our country and in Europe, it seems to have entirely disappeared from its native haunts on the Altamaha River in Georgia, and it is now a century since it was seen growing without cultivation.

Plate xxiii. is a good representation of a branch of a small Californian tree, discovered by Frémont in 1846, and named *Fremontia Californica* by Dr. Torrey in 1850. It is the only North American tree belonging to the same family with the gigantic ceiba (*Eriodendron*) of the West Indies. Three species of linden or basswood follow next. The first (*Tilia Americana*) is a common shade-tree in our streets, and is valued for its timber, which is soft, fine-grained, and easily worked into panels, tables, etc., or hollowed into the common woodenware of our kitchens. The other two species, though beautiful trees, are too rare to be of any commercial importance. One of the trees yielding the exceedingly hard and heavy wood commonly called lignum-vitæ (*Guiacum sanctum*) comes into southern Florida, and so has a place in this 'Silva.' The specific name is thought to have been given to it on account of its supposed wonderful and even miraculous healing virtues. Three southern species of prickly-ash (*Xanthoxylum*) have their places next; then comes the hop-tree (*Ptelea trifoliata*), whose bitter fruits have been used at times as a substitute for hops. Then follow several more less-known tropical trees of our southern peninsula, and on plates xliii. and xliv. is represented the true mahogany (*Swietenia Mahagoni*), which once grew in southern Florida so abundantly as to be cut for exportation, but at the present time is found only sparingly on two of the Keys.

The volume closes with the five arborescent species of holly. The first of them (*Ilex opaca*) is much like the holly of Europe, but lacks the brilliant polish of the upper surface of the leaves. It is very rare in southern New England, is tolerably common along the coast of New Jersey, and is more abundant southward to Florida and in the lower half of the Mississippi Valley. Its spiny-bordered leaves and red berries are gathered for sale about Christmas-time, and its beautiful and almost ivory-white wood is much used in cabinet-work and interior decoration. The botanical names of the Dahoon holly and the Yaupon or Cassena have been more or less confused ever since the time of Linnæus, who supposed them to be varieties of one species. Professor Sargent has chosen names for them in accordance with the method announced in the preface, but at variance with the preferences of most of his predecessors.

The next volume will contain the maples, the buckeyes, and probably the locust trees of various kinds, and will be eagerly watched for by all tree-loving enthusiasts. This latter class would have been gratified if the illustrations could have been so planned as to give portraits of individual trees of the different kinds, as well as faithful engravings of the leaves and flowers, and the details of floral and carpological structure. Emerson has a few such portraits, notably the Charter Oak and the Northampton Elm. A good series of American tree-portraits will undoubtedly come at some future time. *Garden and Forest* is amassing one in the way of photographic process prints.

MOULTON'S ANCIENT CLASSICAL DRAMA.

The Ancient Classical Drama: A Study in Literary Evolution. By Richard G. Moulton. Oxford: Clarendon Press; New York: Macmillan. 1890.

Mr. Moulton's book is a study of very ancient material from a novel and interesting point of view. It is perhaps a little alarming to be told in his preface that in the ancient classical drama we see "developments traceable in embryo and on to maturity—unstable forms that continually originate literary changes, reversions to type, and survival of forms long after their *raison d'être* has passed away; while the Drama as a whole will present the double process of growth in simplicity from the indefinite to the regular, and the passage from the simple to the complex." This language, which has a familiar if not seductive sound, shows that the writer has saddled a theory which he rides hard and occasionally rides to death. Yet there is undoubted truth in the basis of his investigation; and the larger part of his work has, moreover, a wider and more practical aim which should commend it to any student of literature. It presents the ancient drama from a purely literary standpoint, and it is addressed to readers in English as well as in the original. It differs, therefore, from the ordinary histories of the classical literatures, such as Müller's, Mahaffy's, or Crutwell's, in that it assumes no acquaintance whatever with the original languages, and omits largely from consideration the personal or biographical element.

The author has shown skill and resource in the difficult task of introducing his untravelled reader to the flavor of the mangosteen. He does this the more successfully because his own work shows everywhere a fresh and immediate acquaintance with the original sources. He dwells with great variety of illustration on the difference between the ancient and the modern dramatic form and conception, and illustrates this by many felicitous comparisons. The structure of the choral ode, for instance, is instructively contrasted with that of the Psalms. The Phallic Procession, or Comus, in which comedy originated, is paralleled by the curious customs of the Cornish flower-dance, or "Furry," which is still kept up at Helstone on the 8th of May. The transition from satire to satiric acting is explained by a sword-dance, partly lyric, partly dramatic, still practised in Northumberland, in which the performers at

one time recite a ballad, and again act its contents. The fundamental differences between ancient and modern tragedy are strikingly brought out by a very ingenious version of "Macbeth" arranged as an ancient tragedy. In this arrangement we have all the Greek conventionalities—a permanent scene, the courtyard of Dunsinane Castle, a prologue spoken by *Hecate*, and a chorus consisting of aged clansmen of *Macbeth*; the physician of *Lady Macbeth* speaks a *rhesis* of the Euripidean order, and a messenger, a spy who has been with the British army, describes their approach and the incident of Birnam Wood. On hearing his story, *Macbeth* bursts out in the traditional trochaic metre:

"Ho, mine armour—ring the alarum—give the clamorous trumpets breath;
Bid them speak from every quarter, harbingers of blood and death!
Hang our banners from the ramparts, to our kingdom's utmost bound
Horsemen ride, and yet more horsemen, let them skirr the country round."

This speech is the last of *Macbeth's* crimes. His death, the battle, and the explanation of *Macduff's* birth must be reported, in accordance with the limitations of the Greek stage, by the aid of an English prisoner and messengers. It must have required something of the British hardihood which does not quail before the composition of Greek iambics, to attempt this clever bit of work; but it answers its purpose excellently, and it incidentally reminds us how fortunate we are that Shakspere belongs to us, and not to the age of Pericles.

The effect of the varying metres, both in tragedy and comedy, and the shades of feeling represented by their transitions, are analyzed and presented with great fulness and an accuracy which is remarkable, considering that technicalities are avoided and English versions are used exclusively for illustration. The varieties of dramatic motives and of the choral odes are described with clearness and detail, and the remarks on the contrasts between these and the modern drama are generally so sound and acute as to tempt one to quotation. We should question the suggestion that the "Hippolytus" is an illustration of "artistic retribution," and that its moral is the *ne quid nimis* even in temperance. The very statement sounds like an absurdity. We doubt, again, whether the Greeks of Pericles's time thought of *Admetus* as a "holy personage," representing the "cause of the religion of hospitable splendor," for which sacred cult and personage *Alcestis* naturally offered her life. The dying speech of *Alcestis* gives not the slightest support to such a notion. The hospitality of *Admetus* is a good reason for the friendship of Apollo and Heracles, and is dwelt upon accordingly. Euripides simply took an old legend, embodying the primitive idea that the Fates must have their victim or a substitute, and made the most of unpromising and difficult material.

The origin of Greek tragedy and comedy, the steps and growth by which they changed their character and put on a modern aspect in the new Attic comedy, in Terence, in Plautus, and in Seneca, are pretty clearly made out as a matter of history, and must always be interesting even when dissected and dried and analyzed to fit the nomenclature of a theory. Mr. Moulton, as we have intimated, is very fond of Mr. Herbert Spencer's ideas and phrases, and notwithstanding all his cleverness—perhaps by dint of cleverness and a great turn for analysis—he has managed to make a rather dry herbarium of his classification of literary species and development. "Choral instability and decomposition of dramatic unity, as lines of development," "Counter tendency to imperfect unity," are expressions which would be less forbidding if they were more accurate. While they wear the austere air of science, it must be remembered that they are based only on analogy and are simply rather stiff and ugly metaphors. For Mr. Moulton seems to forget occasionally that, on the whole, plays are made and do not exactly grow, and that a poet is something more even than a gardener. At one time he speaks of "tendencies" and "cross-tendencies" and "agglutination," of "underplot, embryonic in Sophocles, and complete in Euripides"; at another he uses ordinary language, and calls the prologue and the "miraculous close," *inventions* of Euripides. Would it be any truer to regard the "Alcestis," for example, as a "sport" of the satyric drama which gave rise ultimately to melodrama, than to call it a first experiment and invention of the poet? The fact is, that where we have history, we cannot neglect the personal and creative element; where history fails, the language of evolution answers well enough if we remember that it is based on analogy. The unhistoric growth of literary forms corresponds reasonably well with the unconscious processes of nature; the work of the conscious artist is apt to put the formulas of evolution to confusion.

If Mr. Moulton is too much disposed to wire the flowers of literature into geometrical patterns, we may also complain a little of his passion for categories. This is a failing which perhaps leans to virtue's side. His distinctions are generally clear and well-drawn, but they are sometimes overdrawn. Here, for example, are his varieties of comic wit: "the simple surprise, the reverse surprise, surprise perversion, surprise iterations, comic enumerations, comic persistence"; and these are the ingredients of Aristophanic laughter! Yet, in spite of a certain rigidity of method and a fancy for hard names, there is, we believe, no book in English which exactly fills the place of this survey of the steps by which the Ancient Drama approached and merged into the Modern, none which presents the whole subject more distinctly and accurately, though not always with the charm and sympathetic treatment that the subject deserves.

Under the Cambridge University Extension scheme, Mr. Moulton's lectures were delivered before adult audiences, representing all classes of society, in which not one person in ten would know a word of Greek or Latin. He finds that the ancient classics "rank second only to Shakespeare and Goethe as an attractive subject for lectures." At Newcastle-on-Tyne, his audiences reached a weekly average of over seven hundred, many of whom did regular exercises upon the subject of the lectures and were tested at the end of the course in a formal examination. A recent article in an excellent periodical (the Syracuse *Academy*) advocated the substitution of Anglo-Saxon and early English for the training derived from the Greek and Latin classics. Mr. Moulton's wide experience goes strongly against any such substitution. "The old English writers," he says very truly, "have had less influence in moulding our literature than have Homer and Virgil and the Greek Dramatists. As a practical teacher of literature, I find it almost impossible to give an intelligent grasp of form in Shakespeare to those who are ignorant of Classical Drama."

Another suggestion comes with much weight from an instructor of Mr. Moulton's experience, and may be nearly as much needed with us as it is in English schools and universities. He complains that in practice, study of Latin and Greek is almost exclusively a study of language; that, with the student in the schools and the passmen of the universities, the element of language almost entirely swallows up the element of literature. He reminds us once more that, after all, it is Greek and Roman literature and ideas we are studying, and that the mass of students get little or nothing if they carry away no clear conception of books and authors as a whole. Yet "the ordinary student cannot cover the ground fast enough to compare work with work and author with author." His study of the classics loses all perspective, "tithing the mint and anise and cummin of *oratio obliqua* and the paradigms, but omitting the weightier matters of a poet's conceptions and literary force." To meet this difficulty, various useful expedients, such as extensive sight-reading and private reading, are practised in our best colleges. Mr. Moulton boldly recommends that where a few books of the 'Odyssey,' or a couple of plays, are read in the original, the whole 'Odyssey,' or a group of plays, be prescribed for a study in English, or some course of reading in ancient and English classics combined, of which his appendix contains examples. As to this appendix, we might ask a place in it for Worsley's 'Odyssey,' and we might query whether the 'Epic of Hades' is really an "English classic," and whether the toil and sweat spent in reading it might not advantageously be transferred to the 'Paradise Lost'; and, lastly, we should warn studious readers against Ruskin's 'Queen of the Air,' as a dazzling bubble, blown of so thin and doubtful material that it will mislead more than it can possibly instruct.

In the Footprints of Charles Lamb. By Benjamin Ellis Martin. Illustrated by Herbert Railton and John Fulleylove. With a bibliography by E. D. North. Charles Scribner's Sons. 1890.

A MORE readable book of the sort to which Dr. Martin's belongs does not often come in the way of the reviewer. It is agreeably written, pervaded by a fine literary feeling, and has the touch of personal devotion that often gives a charm to inferior matter. Lamb is an author who is loved by those who care for him at all, and it is the nature of such literary affection to be curious about the small things of the hero's life—where he lived, what he wore, how he conducted himself in his own house, and other such matters of little concern except to those who wish to enjoy the sense of intimacy which only living acquaintance can give in its fulness. Lamb is an excellent subject for writing in this fashion. His personality was interesting, his life had both tragedy and humor in it, some qualities that all men admire mixed with weaknesses which it is mercy to forgive; he was, also, the centre at his own rooms of a notable literary group on the one hand and of a strange collection of odd characters on the other. The man who joked Coleridge and Wordsworth at his ease, and could, as he said, "love a fool," cannot fail to be winning; and yet the story needs that delicate touch of appreciation and understanding which Dr. Martin has successfully given, and given quite naturally, without patronage or preaching. He follows Lamb from lodging to lodging, and, aided by the illustrations of the different houses, has made this rambling journey a kind of narrative; but the substance of the book lies in the successive portraits he draws of Lamb, in the anecdotes he recalls, the scenes from his life that he describes, and in general the filling in of the chapters with a kind of personal reminiscence at second hand. The papers originally appeared in *Scribner's*,

where our readers may remember them; but they gain very much by being read continuously, and they have been admirably printed and set forth to the eye and hand of the reader.

The Story of My House. By George H. Ellwanger. D. Appleton & Co. 1891.

MR. ELLWANGER has been fortunate in giving his reveries and little essays a local habitation in the house which apparently he never built. He cultivates the literature of sentiment and of rare objects of taste; and the associations of a house, its plan and outlooks, its furnishing and decorations, and artistic pleasures, give an excuse as well as a probability to much that would otherwise seem merely the extravagance of a collector in many fields. An essay on the building of a house, with all its kaleidoscopic possibilities in the way of reform, and its tantalizing successes before the fact, is always interesting; and the author is not niggardly in the good points he means to secure. It is but natural to follow these with a treatise on rugs, full of Orientalism and enthusiasm; on the literary den and the caller, welcome or otherwise; on the cabinets of porcelain, the rare editions on the shelves, the briefly indicated details of the spoils of the chase in their proper place; on the greenhouse, with its curious climate and wonderful botany and odors, about which the author writes with unusual charm and precision; on the dining-room and the dinner, on the one culinary feat that serves as example for perfection, and the salad which, though he mentions it not sadly, required the sacrifice of the fragrant blue violets on the table before its edibility was quite "divine"; and on many other of those topics about which it is agreeable to read if the author is himself sufficiently interested in his task. The outer world is kept in view by means of landscape and weather, and talk about the angler's and the hunter's sport; and quotation, which is an indispensable element in this kind of literature, is frequent, and often affords some excellent bit of verse from out-of-the-way volumes. The book aims only to be agreeable; its literary flavor is pervasive, its sentiment kept well in hand, its interest in curios perhaps a trifle out of proportion; but it has an individuality of its own, and is a pleasing addition to those winter books of the study which have come in the track of the summer books of outdoors and form a little class of their own.

BOOKS OF THE WEEK.

Balzac, H. de. The Chouans. Chicago: Rand, McNally & Co.
Bellamy, Blanche W., and Maud W. Goodwin. Open, Sesame. Boston: Ginn & Co. 90 cents.
Charles, C. Honduras. Chicago: Rand, McNally & Co. $1.50.
De Lagutry, N. Love Conquereth: Poems. Sewanee, Tenn.
Garnett, Prof. J. M. Selections in English Prose from Elizabeth to Victoria (1580–1880). Boston: Ginn & Co.
Harrison, S. F. Pine, Rose, and Fleur de Lis. Toronto: Hart & Co.
Hopkins, T. The Nugents of Carriconna. D. Appleton & Co. 50 cents.
Hylton, Dr. J. D. The Sea-King. Palmyra, N. J.: J. D. Hylton.
Jonas, C. Bohemian Made Easy. Racine, Wis.: C. Jonas.
Leisure Hour. 1890. Fleming H. Revell. $3.20.
Lesueur, D. The Marriage of Gabrielle. Chicago: Rand, McNally & Co.
Lyon, Anne B. No Saint. Louisville, Ky.: John P. Morton & Co. 50 cents.
New York Charities Directory. Charity Organization Society.
Niblack, A. P. The Coast Indians of Southern Alaska and Northern British Columbia. Washington: Government Printing Office.
Nield, T. Oliver Cromwell. The Argyle Press. $1.
Peattie, Elia W. The Judge. Chicago: Rand, McNally & Co.
Peyrebrune, G. de Marguerite. The Belford Co. 75 cents.
Phisterer, Col. F. New York in the War of the Rebellion, 1861 to 1865. Albany: Weed, Parsons & Co. $5.
Romance of Real Life. London: Religious Tract Society. $1.40.
Royce, N. K. A Study of Genius. Chicago: Rand, McNally & Co. $1.25.
Schofield, Dr. A. Health at Home Tracts. London: Religious Tract Society.
Scott, Sir W. Old Mortality. Boston: Ginn & Co. 70 cents.
Stratmann, F. H. A Middle English Dictionary. Oxford: The Clarendon Press; New York: Macmillan.
The Secrete Log-Boke of Christopher Columbus. Brentano's.

Wilson, E. L. In Scripture Lands. Charles Scribner's Sons. $3.50.
Wiltse, Sara E. Kindergarten Stories and Morning Talks. Boston: Ginn & Co.
Winter, J. S. He Went for a Soldier. John W. Lovell Co. 25 cents.

HENRY HOLT & CO.

HAVE JUST READY:

Taine's 'Modern Regime.'

By H. A. TAINE. Translated by John Durand. Vol. I. 12mo, $2.50.

The New York *Times* says: This volume "opens with a remarkable study of Napoleon Bonaparte. It is a careful, thorough analysis of his character, and presents him more impartially and comprehensively than any previous writer has done. . . . So trenchant and critical a review and survey of past and present as this volume constitutes has not seen the light for many a day."

Peru.

Incidents of travel and exploration in the Land of the Incas. By E. GEORGE SQUIER, M.A. With illustrations. New Edition. 8vo, cloth, $5.00.

Johnston's Shorter History of the United States.

By ALEXANDER JOHNSTON, Professor in Princeton University. Pp. 340. With maps. Teachers' price, 95 cents; by mail, $1.06.

Adapted to younger pupils and shorter courses than the author's previous 'History of the United States.' Before his lamented death he had written and twice revised the manuscript, and except for a few minor alterations that he would naturally have made in the proofs, the book now appears in the shape in which his hand left it.

A New Volume of

Champlin's Young Folks Cyclopædia.

Games and Sports.

8vo, pp. 831, $2.50.

Dyspepsia

HORSFORD'S

ACID PHOSPHATE.

In dyspepsia the stomach fails to assimilate the food The Acid Phosphate assists the weakened stomach, making the process of digestion natural and easy.

Dr. R. S. MCCOMB, Philadelphia, says: "Used it in nervous dyspepsia, with success."

Dr. W. S. LEONARD, Hinsdale, N. H., says: "The best remedy for dyspepsia that has ever come under my notice."

Dr. T. H. ANDREWS, Jefferson Medical College, Philadelphia, says: "A wonderful remedy, which gave me most gratifying results in the worst forms of dyspepsia."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION: Be sure the word "Horsford's" is printed on the label. All others are spurious. Never sold in bulk.

Letters of Credit. We buy and sell bills of exchange on and make cable transfers of money to Europe, Australia, and the West Indies, also make collections and issue Commercial and Travellers' Credits, available in all parts of the world.

Brown Brothers & Co., Bankers,
NO. 59 WALL STREET, NEW YORK.

LOANS SECURED BY DEED TO choice Macon real estate at 7%, and to improved Middle Georgia farming lands at 8% net to investors. Investments made. THOS. B. WEST, Attorney-at-Law, Macon, Ga. References: First National Bank; I. C. Plant & Son, Bankers, Macon, Ga.

Seashore Lands.

ON THE MAINE COAST AND OTHER PARTS OF THE NEW ENGLAND SHORE. Having made a specialty of these lands for over ten years, I act as agent for purchase and sale. A number of beautiful shore, island, and peninsula properties on Penobscot Bay, on the "Camden Shore," at "Islesboro," the Fox Islands, and the other principal points now being rapidly developed. These lands generally range in acreage from parcels of 10 acres to 300 acres, have beautiful rocks, trees, beaches, and harbors, and comprise some of the few remaining tracts now purchasable at prices approximating farm values, and offer variously some of the best opportunities for gentlemen wishing independent estates for summer occupancy or for investment. For details, circulars, photographs, and particulars address

J. Murray Howe, 27 School St., Boston, Mass.

Coast of Maine.

CAPE ROSIER.

The lands of the "Cape Rosier Associates" on Penobscot Bay, 50 miles nearer Boston and the West than Bar Harbor, Mt. Desert, are offered for sale in parcels of five and ten acres and upwards. These lands comprise over ten miles of almost continuous shore-frontage in one of the boldest and most beautiful sections on the coast, twelve hours' journey from Boston. They front upon fine harbors, have beautiful rocky shores, beaches, woods, and mountain views. The drives along the shores and among the hills are very varied and beautiful. New wharves have been built, and new connections with daily trains and steamboats established. In these lands is offered an exceptional opportunity to purchase for very small sums fine and perfectly protected seashore estates. The lands will not be sold for speculation or in small lots.

"Is it not good to turn to such help as this in beginning the new and untried year?"

THE LIGHT OF THE WORLD, AND OTHER SERMONS.

By PHILLIPS BROOKS, D.D.

12mo, 21 Sermons, 382 pages. $1.75.

"It is a striking testimony to the preëminence of Phillips Brooks as a preacher that the appearance of a volume of his sermons has become an event in the religious world. . . . Of the present volume it may be said that they show no falling off from the high standard which the great preacher has set for himself in his previously published sermons. No one at all interested in the serious things of life, whether he be formally a Christian or not, can read these sermons without being the better for it. Their beauty of form, wealth of illustration, depth of thought, and passionate earnestness give them a place almost their own among the sermons published during the last year."—*N. Y. Tribune.*

"This is the *Fifth Series* of Sermons by this great preacher, who in every successive publication seems still rising to his prime."—*Independent.*

THE CAUSES OF THE SOUL.

A Book of Sermons.

By Dr. WM. R. HUNTINGTON,

Rector of Grace Church, New York.

12mo, 27 Sermons, 390 pages, $1.75.

For sale at bookstores; or sent by mail, postpaid, on receipt of prices.

The Nation.

NEW YORK, THURSDAY, JANUARY 15, 1891.

The Week.

MR. BLAINE'S diplomatic discussions have always been full of surprises. They are nothing if not dramatic. The discussion he has been carrying on with Lord Salisbury during the past year has been a mixed question of law and fact. The question of fact has been whether the United States cruisers had seized British vessels in the open sea outside the three-mile limit, for catching seals; the question of law has been whether the United States cruisers had the right to do this for the protection of the Bering Sea or any other seals, or for any purpose, except the suppression of piracy. There has been a prodigious cloud of words raised about the matter, but the above were the essential points. There was no question of national honor or policy involved; no dispute about territory, or about belligerent or neutral rights. The controversy has arisen in a time of profound peace. In the hands of Seward or Marcy the public would probably hardly have heard of it all. Either of these statesmen would, in fact, have been very likely to leave the matter wholly to the decision of the Admiralty courts, as the British Government left the decision of the question whether slave-trading was piracy. It is in part for the settlement of such questions that courts of admiralty exist. When a Canadian or British sealer was captured, he had his remedy before the United States tribunals. All that either his Government or ours needed to to do was to agree on a suspension of sealing operations until the decision of the court of last resort had been reached. Instead of this, Mr. Blaine has blown the question up, as his wont is, into a huge newspaper controversy, full of digressions and side issues, and *tu quoques*, and tit-for-tats, and irrelevancies of every description, illustrations that did not illustrate, and precedents that furnished no light, and, after writing forty or fifty newspaper columns to avoid arbitrating, has finally agreed to some sort of arbitration.

In the meantime, a British subject has been slowly seeking his remedy in our courts for the capture of his sealing-ship by an American cruiser on the high seas, and has reached the Supreme Court on appeal. This appeal, when decided, would unquestionably have closed the diplomatic mouths of both Blaine and Salisbury. If either of them had taken any further steps, they would have had to be belligerent steps. If the Supreme Court were to award damages to the appellant in the Sayward case, it would leave Blaine without a leg to stand on. If, on the other hand, it decided in his favor, it would put Salisbury in the position, which he could not hold for a moment, of disputing the judgment of the highest Court of Admiralty in the world—a position which he would be only too thankful to keep out of. In short, it would settle the Bering Sea controversy out of sight and out of mind, and would leave the field clear for some joint convention for the protection of that interesting animal, the seal. In truth, the fact that this suit was pending made the diplomatic controversy somewhat ridiculous, because entirely superfluous.

The Canadians have at the last moment changed their policy as litigants by abandoning the proceedings in the suit for restitution and damages, and asking the Supreme Court for a writ of prohibition annulling the proceedings in which the vessel was condemned in the United States District Courts. Two petitions for this have been filed: one by the owner of the vessel, the other by the Canadian Attorney-General, who alleges the approval of his proceeding by the Imperial Government. The contention of Mr. Blaine's friends now is that the intervention of this last-named official is an impertinence, if not a foul insult, inasmuch as it is an official attempt to carry into ordinary litigation a question already under diplomatic discussion. We must confess that while it is perhaps the greatest compliment ever paid by foreigners to a court of justice, and really ought to flatter the national pride, it is ill judged and unfortunate in that, while it will not make the judgment of the Court when it comes any more decisive, it will furnish Mr. Blaine with a means of at least temporary escape from a position which is both embarrassing and humiliating. It gives him an opening for a new controversy, involving neither law nor fact, but raising numerous points of honor, courtesy, etiquette, and the like, in which his journalistic pen will be able to rove about with all the freedom of the wild ass on the plains of Kittimengo.

It must have been the Washington wiseacre who concocted the theory that it is "*contra bonos mores*" to catch seal in the high seas, who instructed our estimable contemporary, the *Tribune*, that a British act of Parliament could empower the Court of Admiralty to violate the law of nations by condemning vessels captured within eight leagues of the shore, in time of peace, for the offence of "hovering" round St. Helena during Napoleon's imprisonment on that island. If his dupe had read the correspondence in the *Alabama* case, he would know what flinders that famous discussion made of the notion that municipal can override international law, even if he had never read Lord Stowell's decision on the famous case of the French ship *St. Louis*, a slave-trader which had resisted capture:

"Neither this British act of Parliament, nor any commission founded on it, can affect any right or interest of foreigners, unless they are founded upon principles and impose regulations that are consistent with the law of nations. That is the only law which Great Britain can apply to them; and the generality of any terms employed in an act of Parliament must be narrowed in construction by a religious adherence thereto." (2 Dodson Admiralty Reports, p. 236.)

He further added, referring to the declaration of the Congress of Vienna denouncing the slave trade as repugnant to humanity, "that great as the reverence due to such authorities must be, they cannot be admitted to have the force of overruling the established course of the general law of nations." Lord Stowell confirmed this decision on appeal in the case of the *San Juan Nepomuceno*, a Spanish ship condemned by the Admiralty Court at Sierra Leone, in which the owner sued the officer commanding the British cruiser for damages. (1 Haggard's Ad. Reports, p. 267.)

That any foreign ship captured for "hovering" round St. Helena would have been discharged by the British Court of Admiralty under this ruling, is just as certain as anything in law ever is. Lord Stowell's judgment in the *St. Louis* case was delivered in 1817, when Napoleon was on the island. The British Parliament could not make slave-trading piracy, and *à fortiori* could not make "hovering" within eight leagues of the shore a punishable offence when committed by a foreign vessel, any more than Mr. Blaine, or even Congress, can make it an offence against good morals to catch seals in the open sea, or the Emperor of Russia could make it unlawful to come within 100 miles of his Bering Sea shores. An imperial ukase has just as much force in the forum of international law as a British act—that is, none at all. An honest Admiralty Court does not administer municipal law as against foreigners. It administers, as Lord Stowell showed, the law of nations, which is made up not of statutes, but of the long-established consensus of the civilized world.

Some of the younger officers of the navy are disposed to rejoice over the ruling of the Secretary of the Navy in Commander Reiter's case, which they think will give them a chance of imitating Capt. Ingraham, when he rescued Koszta from the Austrians in the harbor of Smyrna in 1853. But our young officers must, however great their professional enthusiasm or desire for active operations, remember the legal peculiarities of the Koszta case, and its great legal differences from the Barrundia case. There is no pretence that Barrundia was an American citizen. In Koszta's case there was the question whether his declaration of intention to become an American citizen did not entitle him to American protection on foreign soil, and there was the undoubted fact that his Turkish passport recognized his American citizenship. Secretary Marcy held that Koszta's having his domicile in the United States gave him a claim to American protection abroad. Bar-

rundia had no domicile in, or claim of any description on, the United States. If this theory was correct, Koszta, when he went to Turkey, remained there under the protection of the United States and under the jurisdiction of the United States consul at Smyrna, according to the laws of Turkey as well as the custom of European nations, like all American citizens. Moreover, the Turkish Pasha had formally refused an Austrian demand for his surrender.

The St. Louis *Republic*, discussing the clause of the Senate Finance Bill which provides for an issue of $200,000,000 of 2 per cent. bonds to take the place of an equal amount of 4 and 4½ per cents, assumes that the new 2s are to form "a permanent debt" as a basis of national banking, *i. e.*, that they are not to be redeemable at any time. The bill expressly says that they are to be "redeemable at the pleasure of the United States on and after July 1, 1900"—that is, seven years earlier than the existing 4s. Nobody has proposed to create a permanent debt for banking convenience. While the debt exists as a matter of necessity, it is immaterial to the taxpayers who draws the interest on it, and for so long it may be usefully employed as a basis for bank-note issues. For the perpetuation of the national-banking system, other measures will need to be devised. The public mind is not ripe for them now, but it will become so before the national debt is paid off, whether free coinage of silver is established meanwhile or not. The metallic basis of the currency has nothing to do with the question one way or the other, although at the present time the two things are mixed up politically in a confusing sort of way.

A month ago it would have seemed impossible that the reëlection of Senator Cameron should have afforded any cause for rejoicing on the part of independent observers of Pennsylvania politics. He is a man who never ought to have been made Senator, and never would have been if he had not been the son of his father. His record has been almost barren, and the spectacle of a great State reëlecting him term after term is humiliating. But the attempt to set him aside on the ground of his well-known opposition to the Force Bill, which was started by that absurd organ of the Republican Bourbons, the Philadelphia *Press*, has aroused a sympathy which he could not otherwise have secured. It would have been most unfortunate if this conspicuous exhibition of good sense and patriotism had led to Mr. Cameron's rejection by his party; and his renomination by the Republican caucus after such a fight against him is cause for satisfaction.

"If we are going to have a Force Bill, let's have a bill with some force in it." Such appears to be the motto of Senator Quay, who on Monday introduced his substitute for the Lodge-Hoar measure, the salient feature being a section which provides that "when it shall appear to the satisfaction of the President of the United States that in any locality the provisions of this law cannot otherwise be executed, it shall be his duty, and he is hereby empowered, to suspend there the writ of habeas corpus and to employ the armed forces of the United States, naval and military, for its enforcement and for the protection of the officers whose duties are herein provided for." It is to be said for this proposition that it is at least logical. There are two ways of dealing with "the negro question" so called. One is to do nothing, and this is the course recommended by all friends of the negro who have no political ends to serve, like the men who control the institutions for the education of colored youth in the South. The other is, to do everything—that is, to have the Federal Government interfere with the "strong arm" in earnest. One policy or the other ought to be adopted, and the Quay plan is the one to pursue if force is to be used at all.

The importance of the late Pennsylvania election to Quay and Delamater was more fully revealed on Friday by the arrest of Delamater and all the members of his firm, on a charge of embezzlement, preferred by the County Commissioners, based on his having received the county money on deposit after he knew that he was insolvent. If he had been elected Governor, not only would the hellish designs of the Cobden Club and the Mugwumps against the tariff have been foiled, but Quay would have easily "tided over" the financial difficulty. Quay knew how to do it, because he had done it already. The starting of this criminal pursuit of Delamater raises anew the question how it was that in a great commercial State like Pennsylvania no one was ever found to prosecute Quay for more serious offences than Delamater's. Delamater, being in the banking-business, received public money on deposit which he had much reason to believe he would not be able to pay back when called for. But it was easy for a man in his position to deceive himself about this, and to persuade himself that something would turn up in his business before the money was called for, to help him out of the difficulty. But Quay, not being in the banking or any other business, went boldly to the Treasury, and took what he wanted, just like a bank-robber who knocks down the cashier, or throws pepper in his eyes when left alone in the bank at dinner-time. This has been known for years by scores of reputable business men in Philadelphia, and yet no attempt has been made to bring the offender to justice. Not only this, but the State which Quay robbed has gone on heaping honors on him; and now that he has been fully found out, he retains his Senatorship and his Chairmanship of the National Republican Committee, while poor Delamater, his confederate and subordinate, goes to jail. And yet his party claims, as Mr. Henry C. Lea remarks, "the major portion of the intellect and culture of the land." If it could only now work in among the "intellect and culture" a little common honesty, what a party it would be!

The Supreme Court of New Hampshire having declined to express any opinion as to the way the roll of the new House of Representatives ought to be made up, on the ground that it had no jurisdiction in the matter, it was of course inevitable that the Republicans, who had the Clerk of the last House holding over and in charge of the roll, should secure a decision of all the disputed points in their favor. These points are so involved that only the verdict of a judicial tribunal could carry conviction, and it is therefore quite natural that the party which loses should accuse the victors of being "thieves." In point of fact, the Republicans appear to have quite as good a moral claim to the seats in dispute as the Democrats, especially to those which are based upon the increased population shown by the last census. Consequently, there is no call for indignation on the part of outsiders that the Republicans secure the seats and the State offices and the United States Senatorship which are involved.

Looked at from the non-partisan point of view, the present muddle in Connecticut has two very grave aspects. One of them is the set of bad precedents which has been created already, notably the resolution of one branch of the Legislature implying its own separate right to look into the returns and appointing a committee for that purpose. That any such power resided in one branch of the State Legislature has never been even hinted at heretofore, and the opportunity which this precedent affords for either house of a divided Legislature hereafter to muddle elections for party ends, seems as unlimited as it is obvious. The other and quite as serious aspect of the broil is, that, in an immediate legislative sense, it impedes, if it does not actually check, the reforms which the deadlock itself, as well as antecedent events, has pointed out as imperatively necessary. There are, for instance, the amendment of the lax State ballot law, or, better, the adoption of the Australian substitute; the adoption of a plan vesting definitely in the town moderators or the General Assembly or the courts, as the case may be, the final determination of the vote for State officers; and, lastly, the calling of a Constitutional Convention to abolish what must ever be a prolific source of disputes, the present system of majority Governorships. Any one of these reforms is of importance enough to dwarf the question who is or who is not Governor for the coming two years; yet the deadlock, with its partisan frenzies, seems almost certain to stand in the way of their consideration. The only encouraging feature of the case is, that the people of the State at large have at last before their eyes a concrete example of the defects of their antiquated Constitution, and will more vehemently demand a change.

Gov. Russell of Massachusetts devotes a large portion of his inaugural address to the

subject of lobby abuses in the Legislature, thus keeping one of the pledges of his campaign to do his utmost, if elected, to abolish those abuses. He admits frankly that it is easier to state the evil than to suggest the remedy, and comes to the conclusion that the most effective weapon is publicity, saying:

"Prevention by publicity is possible, and I would suggest for your consideration whether a remedy may not be found in this direction, by making it easier than it now is publicly to investigate the methods used and money spent on pending legislation, and also by giving power to some proper officer, before a measure finally becomes law, to demand under oath a full and detailed statement as to these matters. The fear of publicity, and through it of defeat, may stop improper practices by making them worse than useless."

The efforts of the Massachusetts Governor and his friends to break down the lobby evil will be watched with great interest by reformers in all other States. There can be no doubt that he has made the first formal move in a reform in which all defenders of honest government must take a hand. Publicity is the chief weapon with which they must fight, and it is a very deadly one if it can be brought into full play under force of such legal requirements as Gov. Russell suggests. Once the beginning is made, and publicity becomes the fashion, the lobby will scatter like chaff. It would not remain in existence an hour if all individuals and corporations that have been in the habit of yielding to its demands and availing themselves of its agency, were to band themselves together under pledge to make public every demand made upon them in future. They are really responsible for the lobby, for they call it into being, and it is their use of it which continues its existence.

The strong recommendations of the Australian ballot system which the Governors of Maine and New Hampshire put into their inaugural addresses last week, seem to make it certain that the Legislatures of both those States will enact ballot-reform laws this winter. If they do, every New England State will have such a law, for all except the two named have reform laws of some kind on their statute-books. The Connecticut law is the poorest of them, and is not the Australian system in any proper sense. The Massachusetts, Rhode Island, and Vermont laws are practically alike, and are excellent models for other States to go upon in drafting similar statutes. The recommendation of the Maine Governor comes as somewhat of a surprise, for the Republican Machine in that State, led by the vociferous Boutelle of the Bangor *Whig*, has been opposing the reform, and insisting that it was a "degrading foreign invention, designed originally by Great Britain for use among the convicts of its penal colony in Australia." The Governor seems to have discovered that popular sentiment in favor of the reform was more to be feared than the uproar of Boutelle's displeasure, and has ventured to brave the latter in preference to the former.

Although the Massachusetts Ballot Act does not apply to town elections for local officers, several towns in the State are availing themselves of the permission of the statute which enables them to hold such elections under the provisions of the act. The change involves some expense, but the towns which are making it are convinced that the gain which they reap from an entirely secret ballot is ample compensation. It is argued that social intimidation is often a very powerful and very pernicious influence in local elections where the voters all know one another, and where the vote is so open that every man can see how his neighbor votes, and that the Australian method removes this influence entirely, and makes it impossible for any candidate to exert undue influence of any kind. This possibly has had some effect in impelling the change, but the chief cause of dissatisfaction with the old system is undoubtedly the demonstration which the new system has made in successive State elections of its superiority.

The "summer boarding interests of the State" are now considered important enough to justify consideration in the messages of New England Governors. Gov. Tuttle of New Hampshire calls attention to the work of the Commissioner of Immigration, by which "more than 350 abandoned farms have been repopulated, mainly by Americans, and the business of summer entertainment largely increased." The Commissioner asks an appropriation by the Legislature to prepare and issue a publication descriptive and illustrative of the attractions of New Hampshire, in such form that copies of it may have a wide circulation, and says: "From the best statistics at our command, there have been left in the State by summer tourists during the year more than $5,000,000. A large portion of this has been left with the farmers." Gov. Burleigh of Maine refers to the same subject, and says: "Our healthful climate, and the rugged beauties of our long seacoast, are winning wide reputation, and a constantly increasing tide of summer travel is a growing source of revenue to our people." The fact is, that the Yankee has been rather slow in waking up to the importance of this interest, and he does not yet fully realize how many millions there are in it.

What kind of ideas are prevailing among the cranks of the Farmers' Alliance in Kansas may be gathered from an affidavit filed in one of the courts of that State to procure a continuance of a foreclosure suit. The defendant put in a statement under his own oath of what the Secretary of the National Bankers' Association, Mr. Wm. B. Greene, would swear to if he (Greene) could be found and compelled to testify; but up to the present time, he said, Greene was so fugacious, so *non est inventus*, that his testimony could not be obtained. Greene would have testified (so this affiant declared) that the National Bankers' Association busies itself with alternate contractions and expansions of the currency in order to depress and advance the prices of property so that they may buy all sorts of commodities at low prices and sell them again at high prices. The months in which prices are thus systematically depressed are those of autumn and early winter, while the spring months are selected for the other turn. The reason why the autumn is chosen for contraction is, that then the farmers have to pay their taxes and meet their store bills. As they must have money at such times, the bankers put the screws on them. After making this confession the supposititious Mr. Greene is asked whether the intended effect of the contraction and expansion is actually produced, and he replies that although it is hard to state with certainty, yet he thinks it is produced; at all events the Bankers' Association is satisfied with the results. Being asked why these objects are not plainly stated in the constitution and by-laws of the Association, he replies that they are all included in the phrase which says that the object of the Association is to secure uniformity of action. Whether the court granted a continuance we are not advised, but we should not be surprised if suits were determined on these grounds after the Alliance fills up the bench in Kansas with men who have never studied law or anything else.

Any one who appears on the scene in a political crisis as the man who "told you so," needs to have a very clean past in order to avoid being crushed by the deadly parallel. Mr. Joseph Chamberlain, M. P., has not been at all careful on this point. The Parnell affair is, of course, a perfect godsend to him as a justification for his desertion of his party in 1886, but he is not in a position to make a noise over it. In a speech in Birmingham the other day he crowed in the following amusing fashion:

"We have saved Ireland from disgrace and misery greater than anything to which heretofore in her eventful history she has ever been subjected—the disgrace and misery of being governed by men like Mr. Parnell, who, Mr. Gladstone now tells you, the Gladstonian party are resolved shall never be the constitutional ruler of Ireland."

The words were hardly out of his lips when the parallel man came down on him with the following from an article of his in the *Fortnightly Review* of January, 1886:

"The conclusion, then, at which we arrive is, that the consideration of the Irish land question should be taken up anew, and this time in frank concert with the Nationalist party. Mr. Parnell himself should be challenged in the interests of his constituents to take up the burden of office, and to coöperate with English statesmen in the solution of a problem which lies at the root of Irish misery and discontent. If the leader of the Irish party shrinks from this responsibility, as his enemies proclaim that he will, the offer should be made in turn to other chiefs of the National party, some of whom, and notably Mr. Healy, have shown a remarkable constructive capacity and resource.'

He deserted the Liberals and took his new view of the Irish Nationalists in the following summer—that is, within one year of the utterance of the old one. The right to change one's opinion frequently is one of every man's natural rights, but whoever does so cannot hope to have confidence in his wisdom and honesty remain absolutely unimpaired, unless the intervals between the changes are of a decent length.

THE BARRUNDIA CASE.

COMMANDER REITER, whom Secretary Tracy has disposed of so summarily, has, we are glad to learn, demanded a court of inquiry, and we do not see how the Secretary can, with any appearance of decency, refuse it. If Commander Reiter has committed an offence so serious as to merit dismissal from his ship and severe public denunciation at the hands of his superior, he ought to be tried by court-martial. Dismissal from an officer's command in the navy, accompanied by a public reprimand, is one of the severest penalties a court-martial can inflict. It not only blights an officer's professional career, but it leaves a permanent stigma on his name. It has been inflicted on Commander Reiter by the mere *ipse dixit* of the Secretary of the Navy, without trial before any tribunal known to the law.

This is not the worst of the affair, however. The letter appears to have been communicated in whole or in part to the newspapers some days before Commander Reiter received it. This is of itself strong confirmation of the suspicion that the letter had its origin in bunkum. The internal evidence also is very strong. The style is by no means that of a lawyer of mature age like Gen. Tracy. Lawyers are apt to write with caution, and measure, and close adherence to facts, as becomes men who follow a calling in which all blunders are promptly punished either by the courts or by the adversary. The letter addressed to Commander Reiter was, on the other hand, marked by that windy exaggeration and violence which is known to the general public, we are sorry to say, as "newspaper abuse." We were therefore not surprised to learn from the *Tribune* that it had been composed, if not by Mr. Blaine, under his supervision. Our own belief is, that it was in the main his. The style is unmistakable, being that of the *Kennebec Journal*, the organ of opinion in which Mr. Blaine began his career as a journalist. Taking everything into account, we fear there is little doubt that Commander Reiter has been selected as a cheap sacrifice to the goddess Jingo. He has been offered up as an illustration of the watchful care which the Administration takes of the honor of the flag in foreign ports, and doctrines have been laid down for his destruction which Secretary Tracy at least must know would not bear five minutes' examination at the hands of a first-class Power. He has been found guilty of not having gone out to sea to warn an American passenger-ship that she must not bring a political refugee into a friendly port, the refugee having taken his passage with the full knowledge that the vessel would touch at that port; and then for not having overruled the police of the port and hindered the execution of their warrant in a place undeniably subject to their jurisdiction. It may be desirable to impose a duty of this sort on the commanders of our cruisers in South American waters, but it would be a duty full of risks, the execution of which no first-class Power would permit to foreign men-of-war; we ourselves would be the very last to do so. It is a duty, therefore, which should only be prescribed by special instructions carefully drawn, and fully defining the limits of the officer's action.

We say unhesitatingly that there exists now no authority in international law for the service which Secretary Tracy exacts of Commander Reiter; that any attempt to render it in an English, or French, or German port would lead to serious international complications, and that it is monstrous to punish an officer for not rendering it in a Guatemalan port out of his own head. The whole transaction is marked by a recklessness, as well as injustice, which cannot be accounted for in any other way than by treating the letter as an article strictly intended for domestic consumption, and originating in the combustible room of the State Department. If this be indeed so, it will surprise every intelligent man who knows him, in this part of the country at least, that Secretary Tracy should have lent himself to anything so discreditable.

If Commander Reiter, in failing to oust the Guatemalan police on board the *Acapulco*, committed an offence deserving the severe punishment which has been inflicted on him, the Guatemalan police, in executing the warrant, committed an offence against the United States which demands full and prompt atonement. There is no getting away from this conclusion. If Commander Reiter has been rightly condemned, something was done against our peace and dignity in the harbor of San José on August 28, 1890, for which the Guatemalan Government is responsible under the law of nations, and for which Mr. Blaine is bound to seek satisfaction. If he does not ask for it, he will leave Secretary Tracy in a position which an honest gentleman, to say nothing of an upright public officer, ought to find very uncomfortable. It will show beyond question that he has, for electioneering purposes, done a very gross injury to the character and property of a fellow-citizen, for which the ordinary courts of law offer no redress, and of which any respectable man ought to feel thoroughly ashamed. He ought, therefore, for his own sake, to demand of his colleague of the State Department the prompt statement of our grievance to the Guatemalan Government in one of those loud-resounding state papers for which our Secretary of State is now famous. We shall then get to the bottom of the affair.

THE NICARAGUA CANAL QUESTION.

THE report of the Senate Committee on Foreign Relations in favor of a Government guarantee of $100,000,000 to the Nicaragua Canal Company will, we think, take the country by surprise. There has been no previous discussion of the subject in Congress, in the press, or on the stump. In fact, the country is scarcely aware of the existence of a Nicaragua Canal Company, although a vague recollection that such a company was incorporated by the last Congress lingers in the public mind. Those who remember this fact will remember, also, that there was coupled with it a promise that no pecuniary liability should be incurred by the United States by reason of the granting of the charter. From that simple act to the guarantee of $100,000,000 is a tremendous leap, and one without preliminaries or precedent. Although there is much to be said in favor of the project, and although a certain moral weight is given to it by the fact that the report is unanimous, yet it is a perfectly valid objection against its passage by Congress at this time that the country is not prepared for it. A matter of such magnitude ought to be well considered. All the pros and cons ought to be taken into the account. Time should be allowed for the people to consider both the policy of subventions in general and the merits of this one in particular. There should be no such thing as a snap judgment in the case. While holding this view as fundamental in a representative government, we are not taking ground against the measure *per se*, for we have at present no decided opinion about it. We insist merely that the Government shall not take a leap in the dark; that it shall not establish a bad precedent, and perhaps involve itself in foreign complications unnecessarily, and lose its money to boot.

The first thought that will occur to most minds is, that the subvention to the Union and Central Pacific Railroads has turned out unfortunately to the Government, unfortunately to the companies, and unfortunately to public morals. It has been unfortunate to the Government in that it has expended a great deal of money that there is no likelihood of its getting back. It has been unfortunate to the companies since they built the roads for the subsidy rather than for the railroad business, and in this way involved themselves in troubles which are now extremely embarrassing to them. It has been unfortunate to the public morals because it produced the Crédit-Mobilier and other scandals, and established in California an *imperium in imperio* which exists in full force to the present day. And it is rather humiliating to acknowledge, as we must, that the subvention was wholly unnecessary, because the road would have been built within a few years without any Government aid, as several others have been built since. Some people tell us that the first Pacific railway "saved California to the Union," as though California had been in some danger of going out of the Union. That is not true, but if it were so, the fact has no bearing on the Nicaragua Canal. California is in no danger now of going out of the Union. The Union is assaulted by no perils which are to be averted by new communication with the Pacific Coast.

If the Nicaragua Canal is likely to prove a profitable enterprise—and we think that the outlook is rather promising in that regard—capital will be found to make it; not so soon, of course, as it would be made under Government auspices, but with reasonable certainty. It cannot be said that the

present company has put forth any great exertions as yet. It has not spent any large sum of its own money. It has not strained its credit. It has apparently come to the conclusion that the easiest way to get on is to "lie down" on the public Treasury. It does not seem to be very good business for the Treasury to take the burden at the first onset. No bond syndicate would undertake the financiering of the enterprise on such easy terms. As the Government is not a charitable organization, there is no reason why it should do more than private parties would do, unless two things are first made clear, viz., that the work is essential to the national welfare and that it cannot be achieved by private enterprise. Both of these things may be proved to the satisfaction of the people, but they have not been proved yet. Therefore a decision should not be hastily reached.

The report of the Committee touches upon the Clayton-Bulwer treaty, and assumes that that treaty has been nullified by the lapse of time, or, that it is not applicable to the sort of undertaking that this bill contemplates. This is another argument against hasty action. We do not think that any serious difficulty will be found in that quarter unless our Government goes at Great Britain with horns down, as Mr. Blaine did in 1881. Yet the existence of the treaty makes some negotiation necessary, and negotiation takes time.

LEGISLATION AND THE RAILROAD AGREEMENT.

THERE is a fear in the minds of some of our railway officers, that any action looking towards higher rates taken by the Advisory Board would be followed by hostile legislation on the part of important Western States. There is no reason to suppose that any immoderate advance in railway charges will or can be made because of any organization now attempted; still, the feeling in the public mind at the West will no doubt be influenced to a certain degree by the purposes of the conference as officially declared, and by the bearings of the practical steps taken upon the freights and fares. There may be a great difference in the effect upon Western legislatures between a wish to stop rate-cutting, so that all shippers must pay the published tariffs, and an attempt to change these nominal rates for others yet higher. This fear of hostile legislation is no doubt owing largely to the Farmers' Alliances. Just what effect these alliances will have upon the railroad problem is, as yet, as hard to determine as their political outcome. West of the Missouri River the farmers' organizations are demanding many hard laws against the railroads. In Kansas they propose a law requiring the Railroad Commissioners to be elected by the people, because these have presumed to have ideas of their own about fairness as between carriers and shippers; also such a reduction of tariffs as will yield an annual income not exceeding 6 per cent. upon the investment, meaning presumably first cost.

In Nebraska the biennial report of the Attorney-General to the Governor is full of denunciation of railroads for issuing stock without consideration upon which dividends are paid through extortionate charges. The political game which has been played for some little time by the politicians in and out of office in Nebraska, is now so well understood that the fulminations spoken of are not taken seriously. It so happens that the Board of Transportation of that same State investigated the subject of cost and charges of railroads last July, and reported that no reason existed for reducing rates generally. The Chicago, Burlington and Quincy, having 2,203 miles within the State, was carefully investigated, with the declared result that the annual earnings of that road in Nebraska were found to yield just 5.09 per cent. upon original cost and subsequent betterments. With such a report before it, there seems little probability of large reductions on the part of the Nebraska Legislature.

East of the Mississippi, to judge from the annual reports of the Boards of Railroad Commissioners just made, the feeling is conservative. The Illinois Board has nothing to say about reduction of railway charges. Its attention has been largely taken up with questions of safety appliances, and in this respect—the need of better apparatus and of earnings to pay for them—it no doubt represents the opinions of a majority of the people. The Board says that there are in Illinois about 700 places where one railroad crosses another at grade, and recommends interlocking plants at all these crossings. Such a plant costs about $5,000, or $3,500,000 for the State. The Board also argues strongly for couplers and air-brakes for freight cars—cost of these about fifteen million dollars, or for both items a sum larger than the annual dividends paid by all the Illinois roads, and nearly half the total bonded interest. Such facts should, and doubtless will, make the Illinois Board conservative in advocating improvements or in calling for lower charges.

Praise is also due to the Minnesota Commissioners. These gentlemen have put forth a noticeably moderate platform in their report—whether led thereto by the adverse decision of the United States Supreme Court upon their arbitrary action last year or not, it is needless to inquire. The Board states its principles in the order of their importance, thus: first, transportation of persons and property without discrimination as to persons or places; secondly, safe conveyance of the same; thirdly, the best service the system is capable of; and, fourthly, the cheapest transportation that is compatible with the foregoing and is just to the companies doing the service. Here the propositions are put in their true relation; not abnormally low rates *and* safe conveyance with good service, but efficiency first and the necessary earnings afterwards. If Government regulation is to stand the test of close examination and be justified before the common sense of the people, it must be based upon a clear conception of the relations between expenses and earnings. Compulsory increase of the one and compulsory reduction of the other, without responsibility on the part of the Government for the results, could not long win the approval of the American people.

There is therefore much in the general situation at the West to encourage our railroad managers. It is hardly correct to suppose that hostility to the "Trust" (as the agreement of railways has been called) will culminate in severe laws against the carriers, if the Advisory Board is moderate and attempts only to secure for the roads rates not much if any higher than those now nominally in force and against which there is little or no complaint. If this view is the true one, it follows that if the organizing roads cannot agree now among themselves to exact the published charges from all shippers alike, their failure will be due to other causes than Western State legislation.

CÁNOVAS ON DEMOCRACY AND THE LABOR QUESTION.

IT was something of a coincidence that the leader of the Conservative party in Spain should have been called to power, last summer, just after he had published a series of articles on "Democracy in Europe and America." He may not have had any intention of laying down a programme, but his frank perception of the irresistible advance of the democratic spirit in the modern world cannot but count for a good deal, coming from the chief of a party that has been supposed to stand for all that is reactionary. The frequent excursions of Cánovas del Castillo into the fields of literature are undoubtedly of a sort to give a show of color to the malicious assertion of a Spanish critic, that he always has the air of one snatching a few moments from his constant task of saving the country, in order to instruct all mankind on all topics; but at any rate, in the articles in question, he writes seriously and with a wide acquaintance with the literature of his subject, and his conclusions are worthy of attention apart from the significance of his political position.

After a long historical introduction, in which the growth of the democratic spirit is traced down from its beginnings, he devotes himself to an analysis of democratic institutions as they exist to-day in Switzerland, France, and the United States. He thinks that the Government of Switzerland "comes nearest to the full ideal of the word democracy," though he maintains that "in no democracy does there exist that equality of political rights promised in 1789 to all." He refers particularly to the fact that women are excluded from the suffrage, and that the voting age is so arbitrarily fixed. It may be of interest to note his opinion that, "as England and the United States become democratized, women will undoubtedly enter public life, the logic of a principle getting the better of mere ridicule." His account of political institutions in the United States is remarkably accurate, probably because he so closely follows Prof. Bryce; it

is worth noting that the excesses of party spirit among us, and especially our barbarous spoils system, furnish the strongest arguments this conscientious monarchist can think of against the practice of democracy as we exemplify it.

But Cánovas's exposition of modern democracy is not of so much weight as his criticism of the democratic theory in general. His main objections reduce themselves to two: democracy can give expression to the national will, but not to the national conscience, and can never have those "fixed institutions" which can deliberately preside over popular movements, check them, if necessary, and approve and put them into effect when desirable. "The direction of what is called public opinion may be at times as harmful as that of parties themselves." He insists upon the need of institutions which will express the permanent convictions or the conscience of a nation as well as its passing fancies, and which will also be able to sit like a good genius above the madness of public opinion, choosing the good and rejecting the evil. Of course, he finds his "fixed institutions" in a monarchy, which he tacitly assumes to be supernaturally wise and surrounded by infallible counsellors. His entire criticism, in fact, moves in the realm of pure theory, overlooking the question which, for the mass of mankind, must always be the most important, namely, not how theoretically perfect a political system is, but how well it works.

Whatever may have been the case with his writings on democracy, the long address on the labor question which Cánovas delivered at the annual reopening of the Ateneo cannot fail to carry a certain official significance. He was Prime Minister at the time, and though he disclaimed for his words anything but a personal responsibility, his personal views are almost certain to become the Government's views. In brief, he practically committed himself to State Socialism. He gave the highest praise to the German legislation which has taken such long strides that way, and held it up distinctly as a model worthy of imitation in Spain. Indeed, in public speeches during the pending campaign he has even more definitely promised to inaugurate something like the German system, if given the power to do it. There is every likelihood now that he is to be given another long lease of power. He may not be able to put his projects through: no one knows better than he the fearful inertia that resists any change in Spain. He may not be able to carry his party with him: many of his fair promises at the time of the restoration of the Bourbons in 1874 he could not keep. But the strong prospect is, that Spain will soon be another interesting field in which to watch the experiments of State Socialism.

DEMOCRATIC ASSUMPTIONS.—II.

PROGRESS AND POPULAR GOVERNMENT.

LONDON, December 16, 1890.

DOES democracy promote the advance of civilization?

The connection between popular government and that system of constant ameliorative change which we call "progress," will appear to many readers of the *Nation* so obvious that to ask a question to which there can be but one answer may savor of pedantry. They will at any rate reply to my inquiry with an unhesitating affirmative. Nor need this excite any surprise in the mind of a candid thinker. There exists an abundance of striking facts which suggest that the development of democratic institutions may, in modern times at any rate, be identified with moral and intellectual progress.

The democratic States are in the main the progressive States of the world. England, the United States, modern France, are the countries in which mankind has, during the last two centuries, advanced most rapidly in the diffusion of general knowledge and in the establishment of material comfort or prosperity. They are also lands which have either for ages been the home of popular government, or are now the leading democratic States of the day. Germany, it may be objected, plays a leading part in the affairs of the world, but is governed on principles which are not democratic. The observation is sound, but even in Germany democracy gains ground. Prince Bismarck may have contemned parliaments, but he sought, when he could obtain it, popular if not parliamentary support for his policy; and Frederick the Great, could he revisit the world, would deem Prince Bismarck and Prince Bismarck's successor parliamentarian statesmen.

Who, again, can deny that an observer who looks at modern history as a whole, will find that the development of material prosperity has in most countries coincided with the extension of popular power? Every age, whatever be the prevailing appearance of self-complacency, is tormented by the knowledge of the evils under which it suffers. In England, as, I presume, in the United States, a reformer who fixes his eye on the actual state of society, is certain to point out social maladies, some of them old, some of them new, which destroy or menace the welfare of mankind. But a critic must be wanting in discernment who denies that in England, in the United States, in France, or in Italy, knowledge has increased, and that the diffusion of light has alleviated the sufferings or increased the happiness of the human race. An English artisan of 1890 would find unbearable the conditions under which his father or his grandfather lived in 1830. It would be impossible to exaggerate the follies and crimes committed by France during a century of revolution. But no Frenchman would willingly return to the *ancien régime*, and substitute for the unimpressive rule of President Carnot the benevolent though feeble despotism of Louis XVI., or the vices and tyranny of Louis XV., or even the glory, the oppression, or the bigotry of the *Grand Monarque*. Nor does the historical argument which links together the cause of progress and of democracy stop here: the position is at any rate fairly maintainable that the spirit of freedom has always gone hand in hand with the spirit of civilization. It is the States which in their day were counted the great free States of the world—Athens, Rome, the Italian Republics, Holland, England, and the United States—which have left, or are leaving, their mark for good on the history of mankind.

The real defect of this line of argument, as proving the progressive character of popular government, is that it identifies intellectual or modern freedom with the growth of democracy, while the legitimacy of this identification is in reality a main part of the question we are trying to answer. The advocate, however, of popular government may fairly blend the historical and the logical line of argument. The extension of popular authority produces two results, both of which remove obstacles from the path of progress.

The possession of power by the mass of the people counteracts the influence of limited classes whose prejudices or self-interest may be opposed to the policy dictated by considerations of general expediency. This fact made the strongest impression on Bentham and his disciples. The sinister interest of special bodies, such as landowners, merchants, or lawyers, delayed, as the Benthamites perceived, the most obvious beneficent reforms. If we ask why, not a century ago, the penal code of England was as barbarous as it was unscientific, why legal technicalities checked the administration of justice, why indefensible restrictions on trade were maintained by sagacious statesmen, the rough answer is to be found in the words, "the influence of sinister interests." A man's interest, it should be noted, works after a manner more subtle than is generally perceived by reformers who denounce its influence. Few human beings are so degraded as knowingly to prefer their private wealth or comfort to the prosperity of all their neighbors. But fewer, on the other hand, are the men endowed with sufficient enlightenment to see that institutions from which they themselves derive benefit are injurious to the world at large. A pleader who derived a handsome income from the technicalities of pleading, almost of necessity believed that the arts of the special pleader served the cause of justice. Squires, parsons, and farmers held with perfect honesty, that unless the price of corn were high, the greatness of England was certain to decline, just as with equal honesty merchants and manufacturers used, while trade was protected, to believe that English commerce depended on protection. Democracy, which breaks down the strength of privilege, does undoubtedly remove the hindrances which privilege opposes to progress. However great the evils generated by the French Revolution, the abolition of aristocratic exemption from the weight of taxation was a benefit certain to follow from the triumph of democracy in France.

Popular government, in the second place, thrusts into view the miseries which weigh upon the mass of the people. Of the ills caused by misgovernment the greater number are due not to malignity but to ignorance. Imagination is the rarest of gifts: men are literally unable to imagine sufferings which they do not themselves endure. This is by far the strongest argument in favor of an extended suffrage. The ten-pound householders who, for thirty years and more, ruled England, were as intelligent a body of electors as could well be selected from among the whole people of the United Kingdom; they were better educated than the present English electorate; they were not a privileged body—no hard-and-fast line separated them from those whom it is now the fashion to call the masses. Yet the ten-pound householders could never rise to the conception of a really national scheme of education, and the Representation of the People Act, 1867, which, together with subsequent statutes, abolished the political supremacy of the middle classes, has been followed by constant improvements or innovations which have aimed at meeting popular wants which the ten-pound householders could not meet because they hardly perceived their existence.

To these and other obvious arguments in support of the theory that the cause of progress is

bound up with the cause of popular government, a wise man will attribute great weight. It is far too much the habit of theorists to fancy that things which are obvious or commonplace are not worth attention. Thoughts which occur to every man are often thrust upon public attention because they are suggested by patent facts, or, in other words, are indisputably true. Nothing hinders the search for truth more than misplaced scorn for truisms. Distrust appearances if you like, but do not forget that things constantly appear to be what they in reality are. It needs no passionate enthusiasm for democratic institutions for an honest critic to admit that, as the world now stands, democracy bears the appearance of an ally of progress.

Two considerations, however, go far to forbid absolute faith in the dogma that democracy, *i. e.*, the political influence of numbers, must under all circumstances further the development of civilization.

First, the administration of public affairs is an art. It is an art depending for success on knowledge, on skill, on training; it is based, or ought to be based, on science and education. It is an art, moreover, the complexity whereof increases with the complication and subtlety of our social mechanism. With our existing acquaintance with human nature, with the lessons of history, and with the laws that govern the external world, it would be possible to manage successfully the affairs of such a city as Athens, or even of such a State as the Roman Empire. We could, at any rate, avoid the terrible evils which it is said flowed from ignorance as to the elementary principles of taxation, and which assuredly flow from blindness to the social and economical ruin involved in a system of slavery. Human inventiveness has made far less progress during the course of centuries than might have been expected in political mechanism. But representative government might possibly, had it been known to Cicero and to his contemporaries, have warded off the fall of the Republic. Unhappily, human necessities outgrow human knowledge. The science (using the word in its widest sense) which might have sufficed for the government of Athens or Rome, is hardly sufficient for dealing with the problems which already tax, and will, as the world grows fuller, tax still more severely, the statesmanship of Europe and of the United States. But statesmanship which is to be scientific can, from the nature of things, hardly be popular. The government of the people, even in its best form, means government in accordance mainly not with the knowledge possessed, if at all, by the most highly educated and the most judicious among the citizens of a country, but with the prevailing sentiment of the time. This sentiment is often right, it is certainly often wrong; and its rightness on some occasions does not of necessity correct the practical errors resulting from its wrongness. Popular feeling has approved religious intolerance; popular feeling still, throughout the greater part of the world, supports the protection of trade; popular sentiment condemns, and almost of necessity condemns, all restrictions on that lavishness of indiscriminate charity which produces pauperism. Education, it may be urged, becomes every day more common. This is true. What people forget is, that knowledge also increases, and that the progress of scientific discovery gradually makes the relative ignorance of the mass of the population greater than in ages when the whole store of human knowledge was far less than at present. An ordinary citizen of Athens stood more nearly on the same level of knowledge as Pericles than an ordinary British elector stands on the same level as the most thoroughly educated men in England. Is it likely, it may well be asked, that countries governed by the ignorant will long continue to be countries conspicuous for their respect for science, for the promotion of that kind of progress which depends on scientific discovery? One thing is certain: popular governments are not in modern times famous for good administration. Unless my reading of the *Nation* has led me greatly astray, this is a point which need hardly be pressed on the attention of the citizens of New York.

Secondly, the apologists of democracy inevitably connect, if they do not confuse, the growth of popular power with the development of individual freedom. This connection, to a certain extent, is real. Revolutions like the movement which a century ago shook the foundations of European society, of necessity break down, for a time at least, the barriers which prevent talent or genius from finding its appropriate field of action. The opening of a career for talent reinvigorated France with new life, and gave her strength to come out for a time victorious in the conflict with the combined Powers of Europe. But this opening a path for ability is the fruit not of democracy, but of revolution. In the field of politics, at any rate, it would, I conceive, be rash to assert that the democracy of America, or for that matter of modern France, specially favored the development of talent, or, what is really the same thing, the leadership of character and of genius. No student of Mr. Bryce's 'American Commonwealth' will conclude that the best or the ablest men of the country are to be found within the walls of Congress.

However this may be, it is certain that eras which cannot be called democratic have witnessed the growth and development of that kind of freedom which is conducive to intellectual and moral progress. The plain truth is, that from one point of view a system of government, whatever its name, which enables men of capacity to get to the head of affairs, is in one sense anti-democratic. It creates an aristocracy of talent; it stimulates individual freedom and individual self-assertion; it gives new force to the struggle—if not for existence, at any rate for leadership. It is absolutely opposed to that conception of equality which, whether it be bad or good, lies at the bottom of socialist ideals. Both speculative considerations and practical observation forced upon every one by the circumstances of to-day make it at least dubious how far modern democracy will in the long run favor that kind of individualism which is one spring of human progress. Before we can feel certain how far democracy will be permanently allied with progress, we should examine the true relation between democracy and individual liberty.

AN OBSERVER.

TAX REFORM IN FRANCE.

PARIS, January 1, 1891.

THE opening of the year sees in France the inauguration of a new law remarkable for its practical importance and its historical interest—of a fiscal reform destined to put an end to a secular injustice: the flagrant inequality, namely, of the burdens imposed by the direct tax on real estate, the rate of which has varied from department to department, from commune to commune, with almost incredible partiality. It seems as if these differences could be caused by nothing but a blind chance till a closer examination reveals a law in their distribution: the tax is strictly proportioned to the general prosperity of the community—but inversely. In 1884 the Department of the Seine, with Paris, was paying to the State something less than 2 per cent. of its net returns from values in land, while the wretched departments of the Hautes et Basses Alpes, ruined by the destruction of their forests, and the consequent floods which washed away their scanty surface soil, were at the same time paying more than 7, and several phylloxera-smitten departments more than 6.

This inequality is the more striking in France, in that the love of equality is the most characteristic, if not the noblest, passion of the modern Frenchman. "Liberty, equality, fraternity" shows conspicuous on the portal of every public building, and of this trinity the second is not the least considered. The effort to attain civil equality before the law has been the fertile cause of these changes that have at once rent and welded the French nation, and civil equality is in nothing more plainly acknowledged or denied than in the distribution of the Atlas burden of State support.

If a question of taxes induced the less violent but no less earnest revolutions of Englishmen; if ship money and the Stamp Act, insignificant in themselves, are become historic watchwords, there is at least an intimate relation between the fever of the Revolution and the fiscal abuses of the *ancien régime*. Yet this very revolution instituted a system of direct taxation which, in regard to real estate, at least, is radically vitiated by the old defects, favoring the prosperous and oppressing the unfortunate, and that in an ever-increasing degree. The history of legislation on this subject gives the explanation. In 1789 the Constituent Assembly abolished, with the rest, the old taxes which fell upon real estate—the *tailles* and *vingtièmes*, namely, with the *dîme* collected for the benefit of the Church—and deprived the State of the 321,000,000 francs of revenue which they had yielded. To supply the loss, a *contribution foncière* was decreed, to be levied on all real estate (lands and buildings alike) in proportion to net revenue. In form it was a so-called distributive tax—*impôt de répartition*—that is, the law fixed beforehand the amount required, and this sum was divided successively among the departments of France, the arrondissements of each department, and finally the communes. Each commune then decided what part of its contingent each proprietor should pay. Besides the "principal" of the tax, or the payment to the State, there were collected at the same time a certain number of *centimes additionels* for the benefit of the departments and communes; an addition sometimes, and especially of late years, amounting to considerably more than the "principal."

It is evident that with this arrangement the difficulty lay in the just distribution of the shares to be paid by the different local bodies, and finally by individuals. In the first place, the necessary data were lacking. It is true that various valuations of the territorial wealth of France had been attempted by Vauban, Mirabeau *père*, Dupont de Nemours, Lavoisier, and others, but nothing was certain. The Assembly resigned itself to an empirical solution. Since each division of the kingdom had paid under the old system all it was capable of down to the uttermost farthing, the new *impôt foncier* was distributed according to the proportional amounts formerly paid in taxes, direct and indirect together. At best this could be but a hit-or-miss method, but its partiality was aggravated by the inequality between the former *pays d'élection* and *pays d'état*—

that is, those which fixed their own contingent and those which were deemed by the King's officers. This naturally gave rise to complaints, which were answered (1797–1821) by a series of reductions for the benefit of the overtaxed, lowering the income of the impost from the 240,000,000 received in 1790 to 155,000,000 in 1821.

But these reductions failed wholly to go to the root of the trouble, and in 1807 an attempt was made to procure a complete register of real estate in France, giving the situation, extent, and value of each property, and able to serve as a basis for a systematic reform. Unfortunately this *cadastre* was almost forty years in the making, so that the difference in the date of the valuations for different districts made comparisons impossible. In 1821 it was already evident that the original intention must be given up, and it was decided to use the *cadastre* simply for apportionment within the communes. But even if division according to an ideal register could have been effected, it would have been rendered worthless by the revolution in values due to the introduction of railways in the fourth decade of the century. In 1835 another reform was voted, namely, the fluctuation of local contingents with the construction (or demolition) of buildings in the place. Since this change, and owing largely to the great increase of wealth invested in buildings, the sum produced by the tax has been steadily increasing—in spite of the reductions caused by the loss of Alsace and Lorraine and the ravages of phylloxera; in spite, especially, of the lowering of the rate from more than 6 per cent. in 1851 to less than 4 per cent.

In July, 1881, another step was taken. The confusion of land and buildings in one common mass had hitherto added to the difficulty of the whole subject; now an investigation was ordered which estimated them separately and published the results in 1883. The total value of the tax proved to be 175 millions, of which 118 applied to land proper and 56 to buildings. This theoretical division of the subject has led to a practical difference in the treatment of the two classes of property which makes it necessary to speak of them separately. To begin with the land-tax proper, the rate was found to be on the average 4.67 per cent., but this average was made up of such widely differing particulars as Mont St. Michel paying .5 per cent. and Montussan in the Gironde paying 30 per cent., or sixty times as much. To rectify this abusive condition, a reduction of 15 million francs was voted last August, the burden of the thirty-eight overtaxed departments being lightened by nearly 13 millions, and a remittance of between 2 and 3 millions being apportioned among other departments already paying less than their share. The reason assigned for this last arrangement was, that though the average rate was low in these departments, they contained cases of oppression which could thus be relieved. Only five departments were left *in statu quo*—among them, the Department of the Seine. The equalization within the departments is to be effected, I believe, by means of local councils, but it has not yet been extended to individuals.

The reform of the other tax on real estate, that on buildings, is of a much more satisfactory kind, and is the direct result of the investigation of 1887. This work, undertaken at the instance of the Legislature by the Statistical Bureau of the Ministry of Finance (that is to say, by M. de Foville), and most successfully completed by him in 1889, brought to light still more flagrant injustice than any shown by the land-tax. The average tax on buildings was 3.1 per cent. of the net return, allowance for repairs and sinking-fund being set in the case of houses at one-third, of factories and so forth one-fourth. Three per cent. is not an excessive rate, but unfortunately the proportion varies from 1 to 5.3 per cent. between different departments; from .78 to 5.87 per cent. between different arrondissements; and between communes from .15 to 42 per cent. and over. If one commune pays on the average 280 times as much as another, what may not be the difference between the most favored individual in the one and the most oppressed in the other?

Of course these extraordinary differences are due, apart from original injustice, to the changes in local wealth invested in real estate, combined with a fixed or comparatively fixed requirement, and it is easy to see how, in such a state of things, an upward or downward tendency once begun would be constantly accelerated by action and reaction. Wealth would lower the taxes and attract more wealth; poverty would load the poor with extra taxes and decrease the population, leaving the remainder to share the same burden among them. The Alpine villages already spoken of are a case of the latter sort; the fashionable resorts, such as Nice and Vichy, which have experienced a sudden rise of values, illustrate some of the causes of a very low rate. Corsica, the most lightly taxed of all the departments, owes her exemption to special historical circumstances—the indulgence shown a stranger in the family circle who might prove restive under its discipline, and, under the Empire, a consideration for the home of the Bonapartes. On the other hand, Tarn-et-Garonne, one of the most overtaxed, is the victim of an accident. Not constituted till 1808, it was omitted in the division of the tax, probably by the oversight of some subaltern, and afterwards received an unfair imposition.

Happily, this system is now a thing of the past. January, 1891, sees the inauguration of a new order. The tax on buildings is no longer a "distributive" but a "proportional" tax (*impôt de quotité*), *i. e.*, the rate is fixed and its product may be what it will. This rate is set at 3.20 per cent. of the net revenue, the criterion being the valuation of 1887–'89. This estimate was made with such care, in most cases with the coöperation of local authorities, and is so amply corroborated wherever a check calculation is possible, that its imperfections are probably small compared with the abuses it is to rectify; but a liberal hearing is granted to objections, first before the *conseil de préfet*, then before the *conseil d'état*, the suit being without expense when the sum involved is small. The valuation is to be renewed every ten years, but in case of a change in value within the decade an immediate rectification can be had.

The chief difficulty is in the case where the tax is increased, as it is in thirty-seven of the eighty-seven departments, and much hardship seems inevitable. The Department of the Seine, with Paris, is one of the sufferers, for her burdens will be increased by two million francs. Let it be added that the two chief promoters of this reform stand for constituencies which will henceforward have heavier tax-bills to meet, and which may not appreciate the honorable disinterestedness and public spirit of their representatives. But at least these gentlemen and all who have joined in the good work may feel that they have taken their part in freeing France not only from a material cause of distress, but from a reproach to her honor and her justice. That the country at large will appreciate this and be ready to meet the sacrifices entailed by the change, seems attested by the hearty applause with which an audience of Parisians, and in large part of Parisian workmen, received the lectures which Prof. de Foville devoted to this subject in an evening course given at the Conservatoire des Arts et Métiers—lectures of admirable lucidity, simplicity, and finish, of which these notes are little more than a mutilated reproduction. EMILY G. BALCH.

THE SIDON SARCOPHAGI.—II.

WINCHESTER, Va., December 9, 1890.

MORE important by far than the discovery of the tomb of Tabnith, King of Sidon, was the discovery, in the later and deeper tomb, of the Greek sarcophagi with polychrome sculpture. Four of these are remarkable works of art. It will be understood that each of them is a rectangular block of white marble, nine or ten feet in length, four or five in breadth and height. One of them is hollowed out in anthropoid shape within, the rest are simple. The cover of each is a single block of marble of great size and weight—in the case of two of them larger, it seems to me, than the sarcophagus itself. These immense pieces of stone were found in chambers at the bottom of a shaft forty feet deep, in a country where there are no derricks nor any mechanical contrivances accessible with which to raise such masses. Taking advantage of a fall in the ground of about twenty feet or so from the rock plateau to the garden level a little below the tombs, Hamdy cut a sloping tunnel through the rock to the foot of the shaft, and dragged the sarcophagi up this tunnel, one by one, by ropes and man-power. Then he constructed a road through the gardens and dragged them in the same way about three-quarters of a mile to the sea. No one who has not tried it quite realizes the engineering difficulties with which the excavator has to contend in such a country.

The first of these sarcophagi which I saw was an imitation of a peristyle Greek temple. Between every two columns was a female figure in an attitude of mourning. The conception is somewhat stiff in its uniformity, but the execution of the weeping figures is so varied and so graceful that the stiffness is overcome, existing in description rather than in actual fact. The minor adornment, also, is singularly beautiful. The coloring of this sarcophagus is almost worn off. Next to this is the sarcophagus of an old man. On one of the longer sides he is represented about to mount his chariot. On the other long side he is engaged in the hunt, and on one of the short sides he is banqueting. In each case he is the central figure. The lower part of this sarcophagus shows signs of having stood in the water. It is slightly discolored, and it seemed to me that the clear outline of the figures had been somewhat blunted. Nevertheless, it was a singularly beautiful work of art.

The third sarcophagus was much larger than the preceding, and the cover was high and pointed, with gables at either end. On the two long sides is represented a chariot race. The heads of the horses are, I think, the most beautiful that I have ever seen in marble, so striking and effective that on first inspection I preferred this sarcophagus above all the others, returning time and again to admire the horses. Further examination, however, revealed a stiffness in treatment, the forelegs of the galloping horses in each chariot forming, for example, one straight line. Moreover, the bodies of the horses were somewhat too round and barrel-like. At the short ends centaurs

were engaged in combat, one of them using an earthenware jar for a weapon. Each end was the same, and the scenes on the two long sides were almost identical. The impression made on my mind was that they were intended to be the same, but were assigned to different artists, one or both of whom introduced variations in the theme. To support this notion I thought that I observed considerable difference in execution, the side towards the door as one enters being much finer than the other. It was on this side that I particularly admired the execution of the horses' heads. In the gables were griffins. Here, in the gables, the polychrome was well preserved, and there was much gold, but elsewhere it was badly worn away.

Each of these three sarcophagi is in itself a beautiful work of art, and each of them greatly surpasses in beauty any other sarcophagi which I have ever seen, but no one of them bears comparison for interest or beauty with the fourth sarcophagus. One of the long and one of the short sides of this represent a battle between Greeks and Persians. At the extreme left, the beginning of this scene, is Alexander the Great on horseback. The central figure of the scene is a young, beardless, handsome Greek, also mounted. The head of this figure had not been restored when I saw the sarcophagi, but I was enabled to see it by the kindness of Oskan Effendi, Professor of Sculpture in the School of Art at Constantinople, who had, I believe, been with Hamdy Bey at the excavations, and who has conducted the restoration of the sarcophagi. The hat of this youth had been gilded (to this Oskan Effendi called my attention), and his is the only figure which was so distinguished. This and his central position would suggest that the sarcophagus belongs to him. If the same figure could be found in the hunting scene, his proprietorship of the sarcophagus would be settled beyond a doubt. But I believe that he has not been found, and I did not myself make a comparison. At the extreme right hand of the battle scene on the long side is a third Greek on horseback. Hamdy Bey states that he is an old man, and that the face is the same as that of a Greek who is being assassinated by Greeks in the bas-relief in one of the gables. If this identity be actually established, then I think that Hamdy's argument that this is the sarcophagus of Perdiccas, in support of which he adduces further corroborative evidence, is proved, although I should still be perplexed by the position of the young man with the gilded hat in the centre of the field. It did not seem to me, however, that the identification of the two figures mentioned above was satisfactory, but I have not compared them with the same care as Hamdy. His argument should be studied as he himself presents it, and his illustrations will furnish a means to check the argument for one's self. At least he proves that the sarcophagus belonged to a man of the first importance, who had campaigned with Alexander the Great, and who was in some way connected with the assassination of a Greek, probably with the assassination of Perdiccas. This and the other sarcophagi found in the same tomb must therefore be ascribed to the close of the fourth century B. C.

To whomsoever the sarcophagus may have belonged, it is worthy not merely of a general of Alexander, but of Alexander the Great himself. So vivid and realistic a piece of sculpture I have never seen. I was literally confounded with amazement and enthusiasm when I first saw it. I have never felt such an enthusiasm over any other work in marble as I did over this sarcophagus. But it was so different in execution from anything which I had ever seen before, that, although I was carried away with enthusiasm the first time I saw it, I did not then gauge its real value, nor appreciate what an immense importance it possessed as a veritable revelation in plastic art. Each time I studied it it seemed more remarkable than it had the first time. What especially interested me was the use of painting in connection with sculpture, and the excellence of the perspective. The figures in the foreground are in very high relief, almost free-standing statues. From this they recede through every degree of relief to painting on a flat surface. I recall one soldier who lies dead on the ground. He is in rather low relief, and stretches into the background, until his shield and part of his spear are painted on flat marble. But so gradual is the transition that you must feel with your fingers to determine just where the relief ceases and the flat surface begins. In the case of harness, garments, and so forth the same method is pursued. Sometimes sculpture and painting are combined, sometimes the latter alone is used, according to the degree of relief to be given. The effect is far more realistic than anything which can be achieved by either sculpture or painting. While admiring beautiful statues, I have always had an uncomfortable sense that they were dead people, very beautiful, but lifeless. Paintings are not open to the same reproach, but I am not able permanently to keep my knowledge out of my eyes, so to speak, and the paintings will be paintings on flat canvas. The trouble with bas-reliefs is the lack of perspective; the figures tend to stand on top or inside of one another. But these are matters for the artist to discuss and criticise, not the archæologist. Suffice it to say that to me, a layman in art, the battle-scene on this sarcophagus, thanks to the combination of painting and sculpture which I have tried to describe, possesses a realism greater than any work of art which I have ever seen. As to the sculpture, it goes without saying that it is wonderful. The colors are not entirely preserved, but so much that with very little exercise of the imagination the whole thing stands restored to you.

Another curious piece of realism is the use of metal for the horses' bits, for spears, swords, etc. Similarly gold is used for the jewelry. I have spoken of the design of the first sarcophagus, the "Weepers," where a stiff and monotonous plan is overcome by variety of detail. Something of the same sort is to be remarked in the Alexander sarcophagus. Taking the battle scene on the long side, one observes that there are two horsemen, a Persian and a Greek, to the left, two to the right, and two in the centre. The footmen and the corpses are almost divided into fields exactly balancing each other in the same way. But this precise balancing is handled so gracefully that it seems to be only a perfect symmetry. I know that in description it sounds hopelessly stiff and angular, but the skeleton of a formal, precisely balanced plan is so perfectly covered with the flesh of natural and varied action that I discovered its existence only by the accident of counting the figures to see how many there were.

I have devoted my description to the battle scene. The hunting scene is nearly if not quite as interesting, and even better preserved. The minor work on this sarcophagus also, above and below the main fields, and on the cover, is very remarkable.

These sarcophagi when found were all considerably injured. Fortunately the pieces were almost all found with the sarcophagi, and they have been admirably restored—that is, the original pieces themselves have been dexterously fitted together, so that you have the actual original sarcophagi before you almost intact. The vandals who broke them were apparently quite numerous and armed with effective weapons. In their haste to break in and secure the rich booty which they expected to find, each sarcophagus was attacked at once at each corner, and sometimes at the sides as well. As soon as one person had succeeded in breaking through, the rest abandoned each his corner and assisted in enlarging the breach already made, until it was sufficient to enable them to abstract the contents. From the wholesale character of the work, and the nature of the tools used, Hamdy argues that they were broken into and robbed by Roman soldiers, perhaps at some time of disturbance, when the sack of Sidon and the plundering of its rich tombs seemed to the commanding general justifiable because it had taken part on the other side.

In conclusion, let me repeat again, what I hope my description has justified, that Hamdy Bey has discovered in the Sidon sarcophagi at least one of the greatest art treasures of the world, the full account and description of which by himself both artists and archæologists must await with impatience.

JOHN P. PETERS.

Correspondence.

THE INDIAN "WAR."

TO THE EDITOR OF THE NATION:

SIR: Would to God that this horrid barbarity at the West might rouse some member of our national Congress to a sense of his opportunity!

All this shameful, dreadful business is but the natural fruit of the blundering mismanagement and corruption which always have been and always will be inevitable in undertaking to govern the Indians *without law*, by a set of politicians at Washington.

Why on earth should this great nation be carrying on "war" with a handful of people—people who are absolutely under their control? Why were these people not long ago incorporated into our political system, made amenable, like other people, to the ordinary laws of the land, and protected, like all others, by those laws?

The root of the mischief lies here in the spot which I have indicated. A single member in each house of Congress, devoted, courageous, deeply impressed with the gravity of the situation, could do wonders now, would he but insist upon a radical measure. The old leadership will no longer serve.

A bill which goes some way towards the needed reform has slept for some years in the hands of the Indian Committee of the Senate—a bill that was warmly advocated and pressed by the leading Indian associations of the country. In my judgment, it is a good bill, but it does not go far enough, for it leaves the Indian Bureau still in existence. The whole miserable system of governing the Indians and administering their property without the ordinary legal responsibility should end at once.

JAMES B. THAYER.

CAMBRIDGE, January 12, 1891.

TO THE EDITOR OF THE NATION:

SIR: In all the illustrations of my theories which your correspondents find so ingenious, I believe I have never touched upon one which is

certainly not the least powerful, the relation of this country to the Indians. The reason is that it has not for many years come up in a form which would give it due emphasis. But this sad and cruel and disgraceful slaughter, and the justification of these adjectives by Gen. Miles's article, give a fresh opportunity to point a moral.

There is to-day no human being under this Government who can be held responsible for the treatment of the Indians. I suppose some committee of Congress has the matter in charge, and behind them stands the Indian Commission, *nominis umbra;* but both are beyond reach of appeal. Mr. Herbert Welsh has spent the best years of his life in trying, with the aid of devoted assistants, to bring about some reform, and the result of it all is what we see.

What has seemed to me even more depressing than the fate of the Indians is the utter futility of such efforts, for the want of an objective point. The Secretary of the Interior is nominally responsible for Indian affairs, but is really not at all so—first, because of his limited power, and second, because he cannot be reached in any way at all effective as compared with the pressure to which he is subjected on the other side. If that official had to stand up every day at noon on the floor of the House of Representatives, and, while the rest of the House and the Senate are wrangling over the Force and Silver Bills, some member, animated by the spirit of Mr. Welsh, were to persecute him with a daily cross-examination which he could not evade, and to which he must reply—his replies being printed in every newspaper in the United States—we should soon find out where the root of the difficulty lies, and who are the culprits who are dragging the national honor in the mud; information which is the indispensable basis of every practical reform.

THE JAPAN TREATY REVISION.

To the Editor of The Nation:

Sir: The last mail from San Francisco brings us the resolutions recently passed by the New York Chamber of Commerce in regard to the revision of the treaty with Japan. The question, like all matters that concern the relations of sovereign Powers, presents many difficulties, and is one on which opinions may be expected to differ. Since, however, the resolutions above referred to seemed to be based entirely upon the action of the Yokohama meeting held on the 11th of September, to protest against the supposed terms of the treaties now under consideration, it is but fair to say that the Chamber of Commerce has acted upon very imperfect information, and has committed itself to propositions which would never have been accepted by its members had the facts in the case been known to them. This is not surprising when we remember that nearly one-third of the circumference of the globe lies between New York and Japan, and that the only persons interested in circulating the accounts of the Yokohama meeting were the men who engineered it, and who contrived to give to its proceedings an air of importance which they did not deserve. The second preamble of the resolutions of the Chamber of Commerce runs as follows:

"Whereas, The foreign residents of Japan are a unit in opposition to the relinquishment of such rights [the extra-territorial rights mentioned in the first preamble], as is shown by a mass-meeting of foreign residents of all nationalities, held in Yokohama September 11, 1890, at which over 400 foreign residents were present, and resolutions opposed to this feature of such revision were unanimously adopted," etc.

Now, nothing could be further from the facts as known to all the foreign residents of Japan—to the promoters of the Yokohama meeting no less than to others. Indeed, it is notorious that the action of that meeting not only did not represent the unanimous opinion of foreigners here, but did not represent the unanimous opinion even of the foreigners of Yokohama itself. Out of a foreign population of some 4,500 persons, only 408 were found to subscribe their names to the resolution in question. If we suppose the families of foreigners in Yokohama to consist of five persons each, it will be seen that the number of signers represents less than half the heads of families in the place; but when it is remembered that in all such settlements the number of unmarried men is greatly in excess, it will be evident that a very much larger part than one-half of those entitled to sign the resolutions abstained from doing so.

In the eyes of unprejudiced observers, the meeting in question was not calculated to command great respect. It was too evidently packed by a few skilful manipulators to be regarded as a representative gathering. The entire proceedings were such as, by a familiar figure, we are accustomed to call "cut and dried." The Chairman was chosen in advance; the three resolutions were prepared beforehand; a gentleman known to the promoters was selected to move each resolution in a brief speech, and another to second it; the question was then immediately put to vote and rushed through without debate. Such a mode of procedure can be called nothing less than a travesty on fair dealing and public sentiment. It is on a level with the methods of the lowest ward caucus, and deserves the reprobation of all high-minded persons.

On the 26th of September a meeting was called in Kobe to take action on the same question. But by this time the soberer part of the people was awake and declined to be represented, or rather to be misrepresented, by the implacables of the foreign settlement in this way. They accordingly refrained from ratifying the action of the Yokohama meeting, and adopted instead resolutions of a much milder character, proposing the postponement of the date for the abolition of consular courts until the working of the new codes could be tested. Even this some of the leading residents of the place are said to have refused to sign.

These two gatherings, so unlike in tone, are the only secular meetings held by foreigners in Japan to consider the question of treaty revision. To declare that the action of the handful of Yokohama malcontents represents the unanimous opinion of the foreign residents of Japan, when such residents number some 7,000 or more, is the height of absurdity. It reminds one of Burke's well-known comparison in speaking of the partisans of the French Revolution in England: "Because half-a-dozen grasshoppers under a fern make the field ring with their importunate chink, while thousands of great cattle, reposed beneath the shadow of the British oak, chew the cud and are silent, pray do not imagine that those who make the noise are the only inhabitants of the field."

On the other hand, on the 3d of October a memorial was addressed to the British Minister in Japan, signed, with a single exception, by all the English missionaries in Tokio. The aim of this memorial was to counteract the influence of the Yokohama meeting, and called for such a revision of existing treaties as "will, while sufficiently safeguarding the rights and interests of H. B. M.'s subjects, satisfy the legitimate demands of H. I. M's Japanese Government in the matter of extra-territoriality." On the 14th of the same month the Central Missionary Association of Japan, including representatives of the various Christian churches engaged in missionary labor here, at an unusually full meeting adopted a similar resolution, declaring that "every just and legitimate demand of the Japanese Government and people in accordance with the principles of international law should be conceded in revising the treaties between Japan and the foreign Powers concerned."

In view of these facts, it is a matter of regret that the New York Chamber of Commerce should have been led, through insufficient, or rather through false, information, to put forth such a resolution as it did. The generous policy hitherto pursued by the American Government towards the Japanese should not be influenced by the action of a few implacables in a packed meeting led by Englishmen who are actuated partly by motives of gain, partly by that spirit of self-assertion which has often led them to do scant justice to nations not fully prepared to defend their own rights.

A peculiarly ridiculous feature of the Yokohama meeting was the participation in it of representatives of the Chinese settlement in Yokohama, a Chinaman being even put upon the Committee intrusted with the duty of spreading the action of this august body before the civilized world. That the people of a nation where justice in the hands of the mandarins is a regular matter of barter and sale, where the inhuman practice of judicial torture still prevails, and where extortion and oppression are the common penalty paid by the individual for increasing prosperity—that such people should declare themselves to be in great danger when called upon to submit to the jurisdiction of the only Oriental nation that has put itself in the line of Western civilization and Western progress, while they themselves are slowly dying of dry rot at home, is so absurd as to give to the whole meeting an air of travesty.

The balancing of considerations of safety with those of international justice in the revision of the present treaties may justly occasion differences of opinion. The high intelligence and progressiveness of the Japanese, combined with their extreme sensitiveness to the opinions of the rest of the world, and their desire to be acknowledged as no whit behind the most advanced civilization of the West, will in all probability constitute a moral safeguard in the administration of the new codes quite adequate to all the requirements of the case. Still, it may be the course of prudence to fix a date, say five years in the future, for the abolition of the consular courts, or to provide for a joint commission to agree upon the time for abolishing them after the mode of administering the codes has been satisfactorily seen. Two things, however, are certain: first, that the extreme irritation of the Japanese people at the humiliating and unjust position in which they are placed is such that the present condition of affairs cannot much longer continue; secondly, that the immense strides made by them in the last thirty years demand and must receive ample and honorable recognition in their treaties with Western nations.

CHEAP MONEY FOR FARMERS.

To the Editor of The Nation:

Sir: Your editorial in your issue of Decem-

ber 25, 1890, on "Cheap Money, Dear Goods, and the 'Debtor Class,'" draws attention to the very apparent fact that, of all the so-called "debtor classes," the heavily mortgaged farmers are substantially the only ones to be benefited by a "cheapening" of money through the debasement of the standard. It does not suggest, however, what I believe to be a fact, that only a comparatively small fraction of these farmers are in any position to avail themselves of this "cheapening" of money through a reversion to the silver standard.

Probably 90 per cent. of the farm mortgages of this country are negotiated by systematic lenders, by banks and by corporations organized for this express purpose. Some familiarity with the business as it is conducted in the West and Northwest enables me to say that in this part of the country, and probably everywhere, both in rural and urban loans, it has long been the custom of these lenders to make the mortgage debt, both principal and interest, payable *in gold*. Though I do not know that any statistics are obtainable, I do not believe that it would be any exaggeration to say that full 75 per cent. of the mortgage indebtedness of the country is in terms expressly made payable *in gold*. That such a stipulation can be enforced is well settled. (See Bronson vs. Rodes, 7 Wall., 229, affirmed in Trebilcock vs. Wilson, 12 Wall., 687.)

Probably not one farmer in fifty is aware that such is the condition of the mortgage-note or bond which he has signed. Hitherto, for many years, it has been a matter of no importance in what medium his interest was paid. All of our different issues of money, being interconvertible at par, payment in any one of them has been accepted as a compliance with the contract to pay gold. But once let the impending silver standard be reached, and gold rise to 120 or thereabouts, and these thrifty people who are now so anxious to have their debts scaled down by act of Congress, will awake to the fact that they have been scaled *up* instead of *down*. We can imagine the maledictions of the "honest" granger lover of "cheap money" as he passes over one hundred and twenty dollars in silver to pay an instalment of one hundred dollars interest in gold.

If he were to be the only sufferer, it would be poetic justice, and might be the best policy, to let him thus find out for himself that honesty is the best policy. But, as you remark, the dangers and possibilities of disaster on all hands from a debasing of the currency are so serious that it may be worth while to offer an argument even to the cupidity of the dishonest.

HOWARD L. SMITH.

ST. PAUL, MINN., January 5, 1891.

A THIRD VIEW OF THE ITALIAN ELECTIONS.

TO THE EDITOR OF THE NATION:

SIR: Since our own memorable elections of last November, many politicians who naturally were educated to entertain optimistic views concerning elections have become reasonable, thoughtful, and public-spirited pessimists. The *Nation*, instead of losing time in vain jubilation, delighted its readers by a regular and well-tabulated synopsis of the ballot returns by States and even by Congressional districts. This comprehensive epitome of the respective votes cast in 1888-'90 has inspired many readers with a passion for statistics and a love of figures which your London and Roman correspondents have not satisfied, as far as the Italian elections are concerned. The cable had carried the news of the great Crispian victory to all parts of the civilized world, and this great victory is confirmed by private letters sent directly to the leading papers of this country. Were it not for the French and Italian papers, the lovers of arithmetic in political elections would have to believe implicitly all that is said and written concerning the immense popularity of Crispi and the corresponding stability of the Italian Government. As a matter of fact, correspondents and the subsidized organs of the Italian Government seem to be ashamed to quote figures.

Let us quote for them from the *Diritto* of Modena: In the city of Rome, out of a registered voting strength of 26,918, only 10,630 voted, and the Crispi candidate received just 6,677. In different parts of Italy, where the *non expedit* of the Pope is said not to have been carried out to the letter, the results of the elections are far from justifying your Roman correspondent in saying that "Bismarck governed a king, and Crispi governs a county." The total number of electors enrolled in 115 electoral colleges was 2,108,347; of these 1,060,328 abstained from voting. By these figures it will be seen that, even outside the city of Rome, one-half the voters indulged in the luxury of abstention, and took no part whatever in the election. The reasons for these abstentions will be given as soon as any one explains why the well-to-do, intelligent, and industrious citizens of America generally abstain from taking any part in politics.

AUGUSTIN COLMAR.

MALARIA.

TO THE EDITOR OF THE NATION:

SIR: At the close of his recent letter on "Felo de se," Mr. Fitzedward Hall comments on the use of *malaria* by Americans in conversation and in the newspapers, in such expressions as "he has *malaria*," or "he has caught *malaria*," and says: "Before this can be legitimate, *malaria* must, after the analogy of *cold*, come to mean a disease." If usage determines language, has not *malaria* already "come to mean a disease"? Or is 'Webster's International Dictionary' violating the first rule of a dictionary, that it should record, not make, usage, when to the usual definition of *malaria* it adds:

"2. (*Med.*) A morbid condition produced by exhalations from decaying vegetable matter in contact with moisture, giving rise to fever and ague and many other symptoms characterized by their tendency to recur at definite and usually uniform intervals."

Yours truly, F. L. P.

CAMBRIDGE, MASS.

[The 'Century Dictionary' does the same thing, and both may find some warrant in *medical* usage, though neither cites any example.—ED. NATION.]

"ENGLISH AS SHE IS WROTE."

TO THE EDITOR OF THE NATION:

SIR: The "Publication" following was copied from an official handbill posted last summer by the municipal authorities of Oberammergau, cautioning visitors in regard to the purchase of photographs purporting to be of the Passion Play of 1890. If not a "gem of mistranslation" like that printed in the *Nation* of the 18th ult., it is unquestionably a remarkable specimen of "English as she is wrote":

"PUBLICATION—PLAY OF PASSION, 1890. The Original Reception of play of this year are only those photographies which are made by the concessioned Institution of Art and Expenses, and have the common stamp of 1890. All other images which are sold are still of the years of 1880 and 1870.

"COMMONIAL ADMINISTRATION OF OBERAMMERGAU." D.

NEW BERN, N. C.

Notes.

To gratify the sudden interest awakened in the author, D. Appleton & Co. will issue a new edition of 'The Evolution of Man and Christianity,' for which the Rev. Howard MacQueary is now on trial ecclesiastically at Cleveland, O. Nothing daunted, Mr. MacQueary contributes a new preface in answer to his critics.

Howard Lockwood & Co. will begin publishing in April a 'Dictionary of Printing and Bookmaking,' by W. W. Pasko, librarian of the Typothetæ. It will be a royal octavo volume, in small type, and copiously illustrated. Besides the matter usually contained in such works, it will define the terms of bibliography, bookbinding, engraving, and bookselling, and will have a glossary of the corresponding printers' terms in German, French, and Italian.

Dr. Daniel G. Brinton has in press an ambitious work entitled 'The American Race: A Linguistic Classification and Ethnographic Description of the Native Tribes of North and South America.'

Mr. Jeremiah Curtin has just finished translating Sienkiewicz's 'The Deluge,' the first half of the second story in the historical cycle begun by 'With Fire and Sword,' of which Little, Brown & Co. have already published a second edition in two volumes.

Thomas Whittaker announces 'The Writers of the New Testament: Their Style and Characteristics,' by William Henry Simcox.

'Cornell University and Her Technical Courses: Mechanical, Electrical, and Civil Engineering' is the subject of an illustrated work which will shortly be issued by Frank C. Perkins, Ithaca, N. Y., almost in the style of a holiday publication.

Mr. William R. Thayer's 'Historical Sketch of Harvard University' has been put on sale with Charles H. Thurston, Harvard Square, Cambridge, Mass.

A new English version has been made of Gustav Freytag's 'Lost Manuscript,' and very handsomely issued in two solid volumes by the *Open Court* Publishing Co. of Chicago. The translation has been authorized, and seems to be competent and idiomatic, and on both accounts is calculated to give pleasure to readers scrupulous as to copyright and to literary merit.

'A Short History of Greece,' in 521 pages, by C. W. C. Oman (Longmans, Green & Co.), deserves the attention of teachers, and will be found in many respects a useful and excellent work. It compares in scope and extent with the 'Student's Smith,' but it closes with the Macedonian Conquest. The style is fresh and remarkably interesting, considering the unavoidable condensation of matter. It is full of those minute facts and touches which give life to a narrative; the young student will read it with ease, and will rise from it with clearer ideas on some topics than can be obtained from the respectable manual we have mentioned. The chapter on Spartan training and discipline is a good instance of lively and generally truthful coloring. Misprints, such as Chacion, p. 66, and προξένοι, p. 67 (for Cnacion and πρόξενοι), and some inconsistencies of spelling (Ceadas and Chæroneia) will easily be corrected. A more serious defect is the slight treatment of the period of Demosthenes and the

almost complete omission of literary history. Herodotus is often mentioned, but nothing is said of his life or his great work; Pindar, Æschylus, Aristophanes, and Lysias are not even mentioned. A book of so decided merit ought to be made more complete.

The humor of the Mummy volumes attempted in Germany with so much success a few years ago has quite evaporated in the 'Secrete Log Boke of Columbus' (Düsseldorf: F. Rangette & Sons; New York: Brentano's). It is simply absurd to find this log in *English* (for the American market); and all the imitation of water-soaked and shell and weed-encrusted leaves goes for nothing. Ingenuity seems wasted in such a cause, and one can but commiserate the librarian who is called upon to admit the stained and misshapen volume to his shelves, even with its box.

We confess a doubt whether the 'Seminary Notes on Recent Historical Literature,' forming Nos. xi.-xii. of the eighth series of Johns Hopkins University Studies in Historical and Political Science, were worth printing. As memoranda for fixing the students' own judgment they of course were valuable, and they tell something of contents; but as criticism they can have weight with hardly anybody besides the writers. A total absence of biographical topics is noticeable.

Mr. S. S. Rider, in his Providence 'Book Notes' for December 6, 1890, examines with damaging results an alleged oil portrait of Roger Williams, to which the date 1644 is assigned. "It exists, and is now owned in Boston," where Mr. Rider has recently inspected it. He pursues it through all its transfers, and ends by confronting two engravings from it, in Gammell's 'Life' and Benedict's 'History of the Baptists'—1846 and 1848, respectively—with the portrait of Franklin in Watson's 'Annals' for 1830. The similitude is striking.

The latest project of Cardinal Lavigerie for the redemption of the Sahara and the repression of the slave-trade is more practical than that in which he formerly advocated the formation of a "sacred gendarmerie," to be posted in stations on the great trade routes in the heart of the continent, and put an end to the traffic by force. This plan was abandoned, for various reasons, although more than a thousand men volunteered for the work. The energetic prelate, who has just rendered most signal service to the French Republic, did not relinquish the idea, however, but simply changed its form. He has called for men to form a Sahara Brotherhood, who are to devote themselves to industrial work rather than to military service. They are to go to places where wells have once existed, but have been deserted, reopen them and dig others where water can be found, and plant trees and fruit-gardens. With this occupation will be joined missionary work among the natives and active operations against the slave-stealers. Nearly two thousand men have offered to join the Brotherhood, of whom fifty have been accepted as a pioneer corps. They are to receive a thorough training for fifteen months at Biskra before they go upon their mission. This place, about one hundred and fifty miles south of Constantine, is admirably chosen for this purpose. It is in an oasis in the edge of the desert, famous for its date-palms and olive trees and fruit-gardens, as well as for the Acclimatization Garden established by the French Government some years ago. The Brothers are to serve a probation period of five years, and then enlist for life. The Pope has given his sanction to the project, having authorized a collection to be taken on Epiphany throughout the Catholic world to defray the initial expenses.

Apropos of the life of Fouquet, recently noticed by our Paris correspondent, and of the desirability of assured translation of works of a similar character, "W." inquires: "Why can there not be a club for the purpose, the books to be translated by a suitable person for pay, and the cost added to that of printing? I am sure, with the large number of public libraries that would join, that an edition of 500 copies could be placed. This would be a much better basis for a club than most book-publishing societies have."

Sharp eyes will have detected an important error of a date in our second notice of Messrs. Hay and Nicolay's Life of Lincoln. In paragraph (9) the year of the correspondence between Gen. Sherman and the President should be 1864, not 1863.

—Only a few months ago we had occasion to review most favorably Mr. Curtin's 'Myths and Folk-Lore of Ireland,' and already another valuable and interesting book of his demands notice. This time Mr. Curtin has sought his material among the Slavs and Magyars, and entitled his work 'Myths and Folk-Tales of the Russians, Western Slavs, and Magyars' (Boston: Little, Brown & Co.). The Russian tales, nineteen in number, are all taken from Afanasyeff's collection, well known to English readers by Ralston's admirable 'Russian Folk-Tales.' Mr. Curtin has wisely avoided reproducing the tales already translated by Ralston (with three exceptions: "The Footless and Blind Champions," p. 82, is Ralston, p. 246 of American edition; "Marya Morevna," p. 203, is Ralston, p. 97, and "Vassilissa the Cunning, and the Tsar of the Sea," p. 249, is Ralston, p. 130), although five are variants of tales given by him. The Western Slavic and Magyar tales are, so far as we know, new to English readers, and afford interesting material for comparison with the folk-tales of other lands. Very few have close parallels in Europe: "The Table, the Pack and the Bag," p. 295, is a variant of Grimm, No. 36, "The Wishing-Table, etc."; "The King of the Toads," p. 311, is a peculiar version of "The Story of the Fisherman" in the 'Thousand and One Nights,' ed. Lane, i., 69; "The Treacherous Brothers," p. 370, is a variant of Grimm, No. 122, "Donkey Cabbages"; "The Reed Maiden," p. 457, is a peculiar version of the widespread tale of "The Three Citrons" (see Crane's 'Italian Popular Tales,' p. 338), and "The Hedgehog, the Merchant, etc.," p. 517, is a combination of Grimm, No. 108, "Hans the Hedgehog," and the theme of "The Discarded Queen and her Exposed Children" (see Gonzenbach, 'Sicilianische Märchen,' No. 5, and Köhler's notes thereto). The other tales are not found as a whole, to our knowledge, in any other collections, but are made up of familar episodes, often strung together in a very confused manner. Indeed, both of Mr. Curtin's works afford confirmation of the theory held by some that, after all, there are no well-defined plots in fairy tales, but only a fortuitous congeries of incidents. Before this question can be decided, it will be necessary to wait for the completion of the arduous work undertaken by the English Folk-Lore Society of tabulating the contents of folk-tales. In the introduction, Mr. Curtin gives some very interesting American tales which throw much light upon the evolution of myths and folk-tales, and some account of the three peoples whose stories are translated in the text. The stories themselves are excellent, and, so far as we can judge, well translated. The handsome volume is worthy a prominent place on the shelves of the student of folk-lore, as well as in the library of the general reader.

—The city of Washington, with a population of nearly a quarter of a million, a very large portion of which consists of young persons engaged in the civil service of the Government, who have, strictly speaking, no homes, is utterly destitute of a municipal library or reading-room. Doctor Harris, the present Commissioner of Education, gravely informed a Northern audience, a year or two ago, that in Washington there were two days—an official day, which lasted from nine o'clock in the morning until four o'clock in the afternoon, and a social day, for pleasure and improvement, which lasted from nine o'clock in the morning until four o'clock in the afternoon. This was simply a grim way of saying that the masses in Washington have no opportunities for pleasure or instruction after the closing of the departments. The National Museum, the Congressional Library, the Smithsonian Institution, the Capitol itself are barred against the very class of the people who most need the instruction they afford, and who most earnestly wish to avail themselves of it. Lately the Corcoran Art Gallery has been opened on Friday evenings, and the attendance of thousands of respectable people of the city attests their appreciation of this kindness and their strong desire for intellectual and æsthetic recreation. An earnest effort is now being made by the *Evening Star* of Washington to bring within the reach of the working people of the city the thousands of books that stand unused on the dusty shelves of the departments. It advocates the establishment in the City Post-office, about to be built, of a free library and reading-room, to be furnished with such books as can be spared from the various Government libraries in Washington, to be supported by both Government and District appropriations, and to be accessible to the general public and to all the clerks in the departments. There can be no doubt that such a library would not only diminish ignorance and crime in the District of Columbia, but would add to the efficiency of the departmental employees and the comfort and pleasure of the public.

—The *Star's* inventory of these departmental libraries is noteworthy. The Department of State, as is well known, contains a precious collection of books relating to international law, history, biography, travel, etc., as well as the manuscripts of our early statesmen and the records of the Revolutionary war. Its library dates from the beginning of the Government, and has been steadily supported by Congress to this day. It comprises 52,600 volumes. The Treasury library receives very little aid from the appropriations. The Secretary awards about $500 a year from the contingent fund for the purchase of books; yet by donation and exchanges the librarian has been enabled to secure 21,000 volumes, of which 5,000 constitute a miscellaneous collection for the use of the clerks in general. The War Department, though given no money expressly for the purchase of books, possesses an admirable collection of works on military science and American history, and is especially rich in literature relating to the recent war of the rebellion. Its books number 28,500; those of a lighter sort, constituting its "circulating" library, amounting to about 5,000. A catalogue of the Navy library is now in the hands of the Public Printer. It will record the titles of 23,312 volumes, nearly altogether of a technical character.

Congress gives this library $1,000 a year, to which the Secretary adds from his "miscellaneous fund" the sum of $2,000. The Post-office Department cannot boast of a library comparable with these mentioned. A few works of reference have, however, been bought from time to time by this Department, with the sanction of Congress, but there has been no annual appropriation for its library. Still, it has collected about 10,000 volumes, many of them valuable. The Interior Department not only has a large library, and the largest one of a circulating character, but some of its bureaus have important collections of their own. It owns a great many works of fiction, of poetry, and of biography. The librarian lends to the employees about 300 volumes daily. The library, which only dates from 1850, and which has been supported by a very modest appropriation ($500) for the last fifteen years, now reckons 10,000 books. The library of the Patent Office is celebrated. Begun in 1836, it received at first no important or regular support from Congress. An appropriation of $5,000 in 1879 was reduced in 1885 to $3,000, which is now its main dependence. About $1,500 a year is needed for subscriptions to the domestic and foreign mechanical periodicals. It has at present 60,000 volumes. Another scientific library belonging to this Department is found in the office of the Geological Survey, which owes its growth chiefly to donations and exchanges, though a small sum is devoted to the purchase of books. Its volumes number 28,000, and pamphlets 35,000. Another bureau of the Interior Department—that of Education—has a good working library of 20,000 volumes and 50,000 pamphlets. To Caleb Cushing we owe the formation of the excellent legal library of the Department of Justice. It is said that he sent to Mexico for a collection of law books useful in the controversy concerning California land cases. This formed the nucleus of what is now a library of 20,000 volumes. Congress grants $2,500 annually for the purchase of new books for this Department. The Department of Agriculture, it is thought, contains the most complete collection of books relating to agriculture to be found in this country. It numbers 22,000 volumes, nearly all technical, with an annual addition of about 7,000, for which purpose it is given $3,000. The Department of Labor, lately created, already owns 5,000 books, forming an excellent working library. The sum of $1,000 is granted to this department every year with which to buy books. Mr. Carroll D. Wright, Chief of the Department, urged the opening of this library at night, in order that a beginning might be made of a large free reading-room and circulating library in Washington.

—Niels W. Gade, whose death was announced two weeks ago, was without doubt the best known of Denmark's many composers. Indeed, he was the only Danish composer who won any great popularity in this country and in England. His overtures and cantatas have frequently been produced outside of Denmark, while his concerted pieces are universally recognized as being of the highest order. His songs, however, are less familiar to foreign audiences, and yet in these his genius displays itself perhaps more fully than in his more pretentious works. The Scandinavians have always been known as a song-loving people. Kjerulf and Grieg in Norway; Pacius and Crusell in Sweden; Heise, Weyse, Rung, and Hartmann in Denmark, have won their greatest fame through their songs, and the same is true to a certain extent of Gade. In his songs Gade shows less the influence of Mendelssohn and Schumann; his Northern nature seems to respond to the simple words of his native poetry. "Oluf's Ballad" and "Knud Lavard" are thoroughly Scandinavian in conception, full of the dramatic force of the old ballad. Gade's rendering of Hauch's Polish National Song, too, is fine. And yet these three songs, so popular in Denmark as to be almost hackneyed, have probably never been produced in this country. Gade's greatest work at home, however, was as a leader of musical culture. He occupied in the hearts of his countrymen very much the position held by Theodore Thomas in New York and Brooklyn, as a musical reformer of the best kind. The present state of musical culture in Denmark is in the main due to his untiring efforts. In 1850, two years after his return from Germany, Gade became conductor of the Musical Union, and in 1865 he was appointed Director of the new Conservatory of Music, both which positions he held at the time of his death. Gade died, as he lived, in full activity. On Sunday he played the organ in Holmen's Church as usual; the next evening he was dead.

ADAMS'S DANA.

Richard Henry Dana: A Biography. By Charles Francis Adams. 2 vols. Boston: Houghton, Mifflin & Co.

"OFTEN have I meditated within myself," says an old English writer, "as to what manner of death I would wish to die. *None pleaseth me.*" Probably a man would find it as hard to select for himself a biographer as a mode of death, and some men have died comforting themselves in the hope that the biographer was the more avoidable calamity of the two. Be this as it may, it is certain that Mr. Dana might have fared far worse than to pass through the hands of Mr. Adams. On the whole, he keeps, as a biographer, higher laws than he breaks; and while it would be hard to find a man less fitted, by personal temperament, to measure accurately Mr. Dana's peculiar combinations of strength and weakness, yet he atones for this defect, as it were, by sheer force, by sturdy appreciation of the main quality and service of Dana's life; and by disdaining to withhold any unfavorable lights or to apologize in any way for what was, in its total, an honorable and high-minded career. That it was in some respects *une carrière manquée* is frankly recognized, though there is no fineness of analysis really brought to bear upon the reason why it was so. A lawyer is never quite a hero to his junior partner, and if that junior partner has, fortunately for himself, a temperament less highly wrought or finely strung than his chief's, so much the better, perhaps, for him. Mr. Adams's very inability to reach the finer stops of Dana's nature makes his applause all the more valuable when he says of the one great and memorable act of Dana's life—his defence of the fugitive-slave cases—that it was "simply superb." Whatever shortcomings may be found in the book, in any other direction, those two words leave a balance in the biographer's favor. At the one essential point in the measure he has struck with firm hand the true note.

There is a story of the elder Dana—not Francis, the grandfather, but Richard, the poet-father—which to some extent prefigures the career of the subject of Mr. Adams's biography. Being invited in later life to lecture on Shakspere in some manufacturing town, he read with quiet dignity a lecture that had once received universal praise. A good many people, however, went out, so that, pausing at last, he quietly said that he would sit down for a few minutes, and those who wished could withdraw. When he rose again, a bare handful remained as his audience; but he composedly finished his lecture and never addressed a popular assembly again. No man ever began life with more promise than the younger Dana; up to a certain point he seemed to carry all before him, to have the heights of professional fame or of public life within easy reach, when all at once his audience fell off and his career ended. No one has ever yet made it clear how this happened; we can only say that there was something in the blood, that it was somehow hereditary.

Yet Dana is surer to be remembered than most of the minor figures of the great anti-slavery period, because there was a certain quality of picturesqueness about the man and his career; and nothing lasts better in history, on the whole, than the picturesque. Henri de La Rochejacquelein has a surer place in French revolutionary annals than many field-marshals, and Col. Robert G. Shaw than many great generals in the record of our civil war. There were unique combinations in Dana: he was an aristocrat before-the-mast, a haughty and humble Christian. In England he rejoiced in the abandonment of "the aristocratic distinction of the manor pew" (Adams, ii, 76, 91); yet he practically spent his life in such a pew, and never could quite find his way to the handle of the door. In Washington he records with delight the information that the Unitarian church near by has a very thin congregation (i., 109); yet he heartily admired Theodore Parker, thought his sermon on Webster the best tribute paid to that great man (i., 226), and favored Parker's election as an honorary member of the Harvard Phi Beta Kappa—though this is not in Mr. Adams's book—on the ground that he was no further from the truth than most of the members of the society, or than Dr. Franklin, its supposed founder. No man of his time could state with equal lucidity or equal compactness, either before a popular audience or in a court-room, any argument involving a principle; and he kept himself in touch with his audience, although, it must be owned, with the very tips of his fingers. He was practically the leader of the State Constitutional Convention, his most important public function; and his habitual hauteur did not prevent him from rating highly and even overrating his less regularly trained associates; as, for instance, Mr. Boutwell (i., 244). He was sometimes wrong, as when he regretted the election of Lincoln as "an unutterable calamity" (ii., 265), and opposed the Proclamation of Emancipation (ii., 263–4); but he was uniformly truthful, courageous, and honorable. *Noblesse oblige* was not a phrase with him, but was ingrain; and he could, moreover, put his hand with wonderful precision on the foibles he could not conquer. He says of his own relations with Judge Clifford: "I fear I treated him too much as I felt towards him, as has been too much my way with people, and which is not Christian nor wise, and has in it a certain element of self-sufficiency which we think is courage and due pride" (ii., 326). There is a note of rare distinction in such a self-criticism as that; and nothing that his biographer has said gives us so much by way of a clue to the final diminution of Dana's audience.

Mr. Adams has done well to produce so much of Dana's diary, which is astonishingly full and almost invariably worth printing. The European part occupies a good deal of space, but it is always interesting to watch the career of a cultivated American of forty who visits the mother-country for the first time,

and finds himself perfectly at home among dukes and earls. As Judge Story's fame had prepared the way for Sumner in England, so Sumner's letters opened the path for Dana. He was known to all younger people as the author of 'Two Years Before the Mast,' and to all older ones—for it was then the anti-slavery period of English society—as the defender of fugitive slaves. His own fine appearance and manners did the rest, and certainly no unofficial American ever had in England four weeks of career so brilliant. Mr. Adams's editing of the diary is excellent, except in the insertion of a few needless passages reflecting on the living, and a few errors in the notes, as when he assigns Robert Morris, the first colored lawyer in Boston, to Charles G. Loring instead of to Ellis Gray Loring as a pupil (i., 210). He has described in a most graphic way all his own personal relations with Dana, and has given his own private whims but little prominence, although he cannot resist firing his little shot at his old enemies, the classics (ii., 149), and has curiously blundered in charging Prof. E. T. Channing with the gift of suppressing enthusiasm for English literature among his pupils (i., 24), in view of the very obvious fact that Channing trained more professional authors, high or low, than any half-dozen other professors in the country. Mr. Adams's attempt to find an analogy between Dana and his own great-grandfather can hardly fail to excite a smile, so obviously did the two men differ in temperament (i., 131), but any such personal opinion may well be allowed to pass unnoticed in view of the thorough way in which the biographer has handled the once vexed question of Mr. Dana's alleged infringement of the Lawrence-Wheaton copyright. On the whole, a real debt of gratitude is due to Mr. Adams for preserving, and in the main skilfully, the portraiture of a high-minded and most interesting man, who had the fortune to be a leading figure in important events and at a transitional period.

THE ICELANDIC DISCOVERY OF AMERICA.

The Finding of Wineland the Good: The History of the Icelandic Discovery of America. Edited and translated from the earliest records by Arthur Middleton Reeves. With phototype plates of the vellum MSS. of the Sagas. London: Henry Frowde.

By the consensus of geographers, Greenland, whether it be an island or a peninsula, forms a part of the Western Hemisphere. In discovering Greenland, the Icelanders of the tenth century, therefore, discovered America; and that they not only discovered Greenland, but colonized it, is an historical fact not merely depending for its authenticity upon the evidence of written narratives, but indisputably attested by the many ruins of churches and dwellings yet standing—a sort of Arctic Pompei—along the fjords of the Western coast, and by the runic stones and other objects belonging to European civilization, which have been exhumed in the vicinity of these long-deserted hamlets. Their familiarity with the similar coast lines of Iceland and Norway enabled the earliest settlers to select the fairest sites on the mildest section of the Greenlandic seaboard—that which stretches from Cape Farewell upwards towards the waters of Davis Strait. It is a region looking to the southwest, facing that continental mainland which was then awaiting its discoverer, and is deeply indented by firths and overtopped by mountains. In the grassy valleys, dotted with occasional patches of birch and willow shrubs, and traversed by streamlets rich in fish, at the heads of the deep and narrow fjords, the adventurous emigrants—men hardened by an arduous existence on Arctic soil and habituated to the turbulence of an oligarchic republic—created a miniature Iceland. They acquired possession of the unreclaimed domain, and apportioned it, exactly as their Norse forefathers, a hundred years before, had impropriated the dales and bottom lands of Iceland.

Like the home country, the colony soon possessed its isolated farmsteads (*bœir*), around which numerous outhouses clustered, its little churches and chapels, its low-walled convents, and its modest cathedral, all built, in this new territory, of stone, for Greenland was still further than Iceland from the fir forests of Norway. It had its annual althing, or general assembly of the people, its presiding lawman (*lögmadur*), and its shiremen (*syslumenn*). It had, too, like its prototype, its sagamen and its skalds, for one of the songs in that wonderful collection of mythopoems, the elder Edda (the 'Atlamál hin grœnlenzku') had its origin among these Icelandic Americans. Family feuds and vendettas, like those described in the 'Njáls Saga,' were not wanting, and the warring chiefs of Iceland sometimes pursued their defeated and fugitive rivals to the harbors of Greenland. Cattle, and sheep, and goats the colonists—the first party landed from fourteen ships — brought with them; while fresh-water and salt-water fish, the abundant seals, walruses, and whales, the polar bears, the occasional reindeer, and the flocks of wild fowl furnished them with products for consumption or exportation. Communication with Iceland was frequent; for the earliest colonists had been wont, all their lives, to brave the polar winds and waves in barks scarcely equalling in size the galleys which, in that day, crossed the comparatively placid Mediterranean; and to men who made light of the 600 miles of tempestuous seas which intervene between Iceland and Norway, the 200 miles which separate Iceland from Greenland was no formidable distance. As the colony grew older, Greenlandic priests and well-to-do yeoman visited, in the milder summers, the remote Nidaros (Tronyem), then the Norwegian capital and the seat of the primate of the North, bearing with them for sale the products of the little republic, or the tribute—tithes and Peter's pence—for the civil and ecclesiastical authorities.

The fate of this Icelandic colony is one of the insoluble problems of history. It is useless to consider whether it owed its final destruction to the irruptions of the Eskimos (*skrœlingar*), who made their appearance in the Icelandic portions of Greenland in the fourteenth century, to the attacks of English, Dutch, or Hanseatic freebooters, to the ravages of pestilence, to the enforced neglect of the mother country—itself during the fifteenth century too often in sore straits—to the iniquitous restrictions on commerce imposed by the Government of Norway, or to a combination of several of these evils. Its annals extend from the last years of the tenth century to near the middle of the fifteenth—a period longer than that which has elapsed since the rediscovery of the western continent by the Spaniards; its last definitely attested event was a marriage which took place within its limits in 1409; its line of bishops, nominated by the Popes, embraces the names of a score of prelates.

Iceland, when its only colony disappeared, had long ceased to govern itself, and the old commonwealth had lost, with many other rights and liberties, the power to initiate commercial and maritime ventures; while the Dano-Norwegian monarchy, occupied with foreign wars and impeded by the mercantile rivalry, first of England and then of the Hanse cities, was not always able to maintain its trade even with Iceland. The Greenlandic settlement was, however, never completely forgotten. During the reigns of the earliest Oldenburg monarchs, expeditions were planned at Copenhagen and Bergen for the reopening of commercial intercourse, but it is not certain that these plans resulted in actual effort until the days of Frederick II. (1579). From that date almost every generation witnessed the sailing of exploring vessels to Greenland, but an unfortunate geographical blunder prevented the discovery of any trace of the lost colony. The two shires of the Icelandic settlement, separated from each other by a considerable extent of coast, were known as the Eastern (the "Eystribygd") and the Western (the "Vestribygd"); of these the former was nearer to Iceland and was the more populous and prosperous, including at least twelve parishes, and containing the cathedral village (Gardar), which was also the secular capital; while it was known that the latter had been laid waste by the Eskimos as early as 1379. The Danes consequently directed their efforts to the refinding of the "Eystribygd," but, misled by its name, they sought for it on the bleak and ice-bound eastern coast of Greenland. Although the missionary, Hans Egede, with whom the modern recolonization began (1721), discovered in the west not a few of the ruined structures of the old Icelandic inhabitants, the error in regard to the position of the eastern shire was not dispelled until after the exploring expedition of Capt. Graah (1828-30). Since then, although the Danish Royal Society of Antiquaries has been instrumental in identifying and investigating many of the sites mentioned in the sagas, no little remains to be done in this archæological field before all the attainable facts in regard to the earliest successful settlement in America can be recorded.

From under the shadows of the mountains which looked down upon this remotest outpost of European civilization sailed those fearless navigators who, first of all the Caucasian race, set foot on the American mainland. Their experiences, like all the important incidents in the story of the Icelandic commonwealth, are narrated in more than one special saga, and the names they gave to the shores they discovered are frequently cited in the general saga literature, and still linger in the popular lore and legendary ballads of the north. Reports of the strange finds in the west reached even central Europe, and are chronicled by Adam of Bremen as early as 1070. Portions of the sagas narrating the events of the voyages were inserted in the edition of Snorri Sturluson's 'Heimskringla,' published by the learned Swede, Johan Peringskjöld (1697), but the accounts of all the expeditions and settlements to the west of the Icelandic seas were first fully and intelligently treated by the Icelander, Thormódur Torfason (Torfæus), in his 'Historia Vinlandiæ Antiquæ' (1705) and his 'Gronlandia Antiqua' (1706). These two works are virtually Latin paraphrases of the American sagas, with comments, in which no untenable claims are advanced and no fanciful conjectures hazarded. Until recently they were the only trustworthy treatises at the service of the historical investigator—despite the absence from their pages of the original texts—but were not easily met with outside of Scandinavia. In 1837 Professor Charles Christian Rafn, as Secretary of the Royal Society of Northern Antiquaries (*Oldskriftselskab*), published at Copenhagen a

bulky quarto, the 'Antiquitates Americanæ,' with the intent of bringing together all that the old literature offers concerning the ante-Columbian voyages of the Icelanders—an idea probably suggested by the successful explorations of Graah.

Rafn, an admirable character in many respects, can hardly be called a great scholar, but he was one of those practical and persistent men—rarer, perhaps, than scholars, and sometimes more useful—who possess the capacity of making their conceptions successes. He had organized, almost without assistance, the Society of Antiquaries; he continued to labor for it throughout his life; and he was able, before his death, to accumulate for it a large endowment. He was quick to see that a complete narrative of the Icelandic achievements in the Western seas would be of interest to two worlds, and would greatly extend the fame of the society. He associated with him the widely known Icelander, Finnur Magnússon (Magnusen), a scholar of varied learning, but not always of sound judgment, possessing a good deal more than the traditional fancy and enthusiasm of the antiquary. In his search for the lands visited by the old voyagers, Rafn put himself into communication with members of one of the New England historical societies, from whom he received much topographical information, together with drawings of the so-called "Dighton Rock," near Taunton, Mass., bearing some unmistakably Indian *graffiti*. In these scratchings Finnur Magnússon, later on, found an Icelandic inscription, in which he read the name of one of the explorers (Thorfinn), and, still later, by the same over-zealousness, the "Old Mill" at Newport was metamorphosed into a tenth-century Norse baptistry. The 'Antiquitates,' when finally issued, with its Icelandic texts, accompanied by versions in Danish and Latin, its summaries in French and English, its facsimiles of the old manuscripts, its plates of ruined Greenlandic edifices and Runic inscriptions, its various views of the Dighton Rock, created much sensation in the learned and curious world. Its ponderous and polyglot erudition was indeed overawing to the mind of the amateur investigator. It was, moreover, well advertised. Rafn's diligent cleverness taught him the proper way of making the book, and the society, speedily known. Abstracts of the work, prepared by him, were translated by scholars of more or less note (many of whom did not object to add to their other titles that of "Member of the Royal Society of Northern Antiquaries") into all the languages of Europe.

But nowhere was the volume received with a greater display of interest than in New England, which suddenly found itself discovered six centuries before the landing of the Pilgrims, and able to dispense altogether with the services of Columbus. More than one descendant of the Puritans found this added heroic period of history too great a burden for silence. The appearance of the 'Antiquitates' presently gave rise to a multitudinous literature of books and booklets, articles in reviews and magazines, and papers in the proceedings of historical societies. In most of these a prodigious play of the imagination, unrestrained by any knowledge of the subject treated, invested "the discovery of New England in the tenth century" with incidents and episodes too unsubstantial even for the fertile fancy of Copenhagen antiquaries. Never did New Englanders "guess" so freely. The impression produced by the Danish publication has finally culminated in the erection of a statue of Leifur Eiríksson—and there is certainly no earthly reason why Boston should not adorn itself with the simulacrum of that sturdy Icelandic sailor—and in the finding, near the Massachusetts coast, of the site of at least one Old-Norse city. In this devastated metropolis, as we are told, are still visible the vestiges of an amphitheatre, of terraced courts, of a system of canals and docks—features so preëminently characteristic of a Norse city in the early Middle Ages. Other devotees of Rafn have even manifested an iconoclastic willingness to trample on the memory of Columbus, because he had the hardihood to rediscover America after his Northern predecessors had abandoned it—perhaps wisely—to a continued barbarism. Some are inclined to condemn the Latin language and literature for the reason that the Genoese sprang from the Latin race, and to cast contumely on the Catholic Church, for the reason that he believed in its teachings. All true Winelanders ought to practise the speech of Leifur and profess the Odinic religion of Eric the Red. One ardent writer appears to suspect that the Pope, whose precursors held relations with the see of Gardar, is keeping under lock and key, in the library of the Vatican, the documents which incontestably prove the success of the Greenlandic explorations, with the view of ultimately canonizing the unsaintly Columbus. In truth no literature, of so limited an extent, offers such diversified entertainment as the "pre-Columbian" literature of America.

The assumptions in regard to the Dighton Rock and the Newport Mill were easily disposed of by the investigations of more discriminating students. But although an occasional critic demurred to one or another statement made in the 'Antiquitates Americanæ' and the works based upon it, no systematic correction of their errors appeared until within the last three years. That thorough Norwegian scholar, Gustav Storm, published, first in Danish, in the *Aarböger* of the Society of Northern Antiquaries (1887), and then in an excellent English version in the *Mémoires* of the Society, his admirable 'Studies on the Vinland Voyages.' He begins with the declaration of the voyagers as to the length of the shortest day of the year in Wineland, or what Rafn styles the "astronomical evidence." Availing himself of the aid of modern astronomical science, he confutes the serious errors of Finnur Magnússon, and of some earlier scholars, in their interpretation of the old Icelandic method of marking the divisions of the day—an interpretation failing to ascribe their true significance to the words *dagmál* and *eykt*. The result establishes the fact that the "astronomical evidence" can only be relied upon to prove that the explorers from Greenland went at least as far south as latitude 49° N., and does not demonstrate that they reached the latitude of Narragansett Bay. In a similar way he deals with the distances estimated by day's sails, basing his calculations on the true meaning of the old Icelandic term *dögr*, which is "day *or* night," and "not *twenty-four hours*, as Rafn and others have made out, to bolster up the story." He then goes on to criticise the comparative trustworthiness of the 'Saga of Eric the Red,' and the 'Grænlendingaþáttr'—the two earliest documents which relate the story of the explorations; then examines the oldest maps which give the positions of the discovered tracts; considers the fauna and flora of Wineland as portrayed by the returned voyagers; scrutinizes the particulars recorded in regard to the natives encountered by the Northmen; and analyzes the words of their language cited in the sagas. These last, without insisting on his opinion, he is inclined to assign to the vocabulary of the now exterminated Beothuk Indians.

The conclusions reached by Prof. Storm are that, of the three regions visited by the expeditions, Helluland coincides with Labrador, Markland with Newfoundland, and Wineland with Nova Scotia and the island of Cape Breton. There is little doubt that these determinations are reasonably correct; but, be that as it may, this careful sifting of the texts and the collateral testimony renders it certain that no part of New England can be regarded as the site of the Icelanders' Wineland. Thus Rhode Island loses its age of fable, and can participate, without any scruples of conscience, in the celebration at Chicago of the fourth centenary of Christopher Columbus.

The sumptuous work of Mr. Reeves, so happily entitled, is pretty surely, at any rate as far as the Scandinavian sources of information are concerned, the final word on this important and fascinating theme. It will put an end, it may be hoped, both to the crude speculations of archæological sciolists and to the unbelief which those speculations have aroused in the minds of many rational readers of history. Its author fully equipped himself for the task he has performed so well by a sojourn of several months in Iceland, and by thorough studies and researches during various periods of residence in Copenhagen. In his renderings of Icelandic prose he is free from the faults of most preceding translators; he reproduces the homely charm, the briskness, the story-telling movement of the saga diction without too greatly affecting the use of semi-archaic words. His treatment of all the documentary evidence is clear and critical, and is accompanied by a copious citation of authorities; his method is strictly historical, and he is singularly cautious in refraining from hypothetical conceits—in fact, he draws no conclusions as to the precise site of Wineland, but with judicial reserve leaves the geographical verdict with those who weigh the results of his painstaking erudition. He supplements the astronomical work of Prof. Storm by additional computations made at the Washington Naval Observatory. His chapter on "Notices of Doubtful Value" sweeps away many older and later errors, and that on "The Publication of the Discovery" is full of bibliographical interest.

But beyond all these excellences the volume has one unique merit, involving even greater care and capacity, and constituting an inestimable boon to scholars and investigators. By an improved phototypic process, here used for the first time, Mr. Reeves reproduces, in fifty-five facsimiles, every page of the sagas of Eric the Red and of Thorfinn Karlsefni, as well as of the 'Grænlendingaþáttr,' from the earliest codices. An ingenious arrangement gives, facing each plate, the printed Icelandic text, line for line, with the signs and abbreviations written out, so that every word and character may be scrutinizingly studied. Palæographers will rejoice at the marvellous accuracy of the novel process, which is shortly to be applied to the manifolding of the vellum 'Codex Regius' of Copenhagen, the oldest manuscript of the 'Sæmundar Edda'; and book-lovers will be charmed alike with the beautiful typography of the Clarendon Press and the exquisite taste of the parchment binding. The notes, philological, ethnological, historical, and geographical, with which, and with complete indices, the work closes, are of the utmost value, and show the wide and exact learning of their compiler. No library, public or private, pretending to possess even the sim-

plest apparatus for the study of the history of the New World, can dispense with this delightful volume.

RECENT LAW BOOKS.

'The Supreme Court of the United States: Its History and Influence in our Constitutional System,' by Mr. Westel W. Willoughby (Baltimore: The Johns Hopkins Press), is issued as extra volume vii. in the Johns Hopkins University Studies in Historical and Political Science. This sketch is commendable as a doctor's thesis, having been compiled with care and accuracy; but the author has not fully appreciated the magnitude of his subject. In an essay of only 115 pages a subject cannot be adequately treated which includes virtually all of the constitutional law of the United States, and inadequacy of treatment renders the work nearly useless. It contains nothing original, and does not fully cover any single branch of its vast subject.

Although the essay is too meagre to call for detailed criticism, it is interesting as another symptom of that curious endemic which has recently attacked American writers with great violence. This fashionable disease consists in disparaging the Federal Constitution as a whole—abandoning what Von Holst calls the "canonization" of the Constitution—and adopting the cult of the Supreme Court. It has been produced largely by the recent writings of non-resident foreigners, like Profs. Von Holst and Bryce and Sir Henry Maine, who are excusable for exaggerating the importance of peculiar institutions. The fact is, that the Supreme Court has simply borne its share of the successes and failures of the general scheme of our Government. It has certainly not enjoyed any immunity from error, and it is very doubtful whether the court has been more successful in performing its functions than any other one of the great departments. Mr. Willoughby says that "by this article [of the Constitution] we see finally created what has proved probably the best working branch of our Government." This is certainly untrue at the present time. Just now it is not the "best working branch"; it is probably the worst. It is overwhelmed by its business, and the delay in reaching cases amounts to a practical denial of justice. This is not a novel condition of affairs, nor is it even the principal charge which may be brought against the court as an institution of our Government. Its decisions, aside from political questions, have not always commanded the respect of the bar or the community, and its commands have been ignored by the Federal departments, by the President, and, even in time of peace, by several of the States.

In no book in general use are the glories of this court more apparent than in Judge Cooley's famous work, which is commonly known as the 'Constitutional Limitations.' The sixth edition of this standard treatise has just appeared (Boston: Little, Brown & Co.), having been edited by Mr. Alexis C. Angell of Detroit. Judge Cooley states in the preface to the new edition that his official duties have put it out of his power to perform in person the necessary labor of revision, but that Mr. Angell has "examined all the new cases, making use of them so far as seems important, and adding to the references till the whole number now reaches over ten thousand. Where it seemed necessary, the text has been changed and added to." Judge Cooley enjoys the distinction, which is shared by only one or two other living writers, of having written a book which is referred to and recognized by the courts and bar as possessing almost as much authority as the decisions themselves. It is, therefore, no longer open to criticism in the ordinary way. A whole generation of lawyers has approved its merits, and the only remaining question is, whether the new edition has been carefully and thoroughly prepared. So far as can be ascertained by testing the references here and there, the editor seems to have performed his work successfully.

One of the principal merits of this book is the fact that the authorities are cited with the most painstaking accuracy, and the editor seems to have emulated Judge Cooley's example; but it is not correct to say that the case of People vs. Gillson (109 N. Y., 389) supports the doctrine that "sales of food of which prizes or gifts are part of the inducement may be forbidden." That well-known case establishes precisely the contrary. "Gift-sales" may not be forbidden by law in New York. The only important omissions which we have noted in a somewhat careful examination of this edition are the Bible in the Public Schools case (State vs. District School Board of Edgerton), where the Court held that, under the Wisconsin Constitution, the reading of the Bible in the public schools is unlawful; the Mormon Church case (136 U. S., 1), where the Supreme Court decided that Congress has power to confiscate the property of the Mormon Church in Utah; and the Idaho Test Oath case (Davis vs. Beason, 133 U. S., 333), in which the disfranchisement of citizens in Idaho on the ground of membership in the Mormon Church was upheld by the Supreme Court. The editor doubtless omitted the last two cases intentionally, under the impression that they were not within the scope of this treatise; but Judge Cooley has discussed questions relating to the Territories at page 37, and these cases should have been cited at that point.

The author seldom attempts to reconcile conflicting cases, and very seldom expresses his own views. He does venture, however, in a very guarded way, to point out the evil results arising from the Dartmouth College case. He says that "it is under the protection of this decision that the most enormous and threatening powers in our country have been created, some of the great and wealthy corporations actually having greater influence in the country at large and upon the legislation of the country than the States to which they owe their corporate existence." An outburst of this kind is of very little value in a legal treatise. The author deviates from his rule also in his statement of the famous grain-elevator case of Munn vs. Illinois, and endeavors to ascertain the legal signification of the phrase "affected with a public interest." He enumerates four classes of business which in his opinion may fall within the rule. Curiously enough, not one of these classes would include the very case on which the whole doctrine rests.

EARLE'S ENGLISH PROSE.

English Prose: Its Elements, History, and Usage. By John Earle, M.A. G. P. Putnam's Sons. 1891.

Mr. Earle has written a unique work, of great value to writers who desire to form a good English style in the structural sense. He has the advantage of a very wide and thorough knowledge of the language in its successive historical stages, and he brings his learning to bear with an effect quite beyond writers on rhetoric. It is inevitable, perhaps, that he should overweight his matter (in our judgment) with philology in some passages which have only an episodical relation to his subject; but the work gains so much from his knowledge of words and construction, and his excellent discrimination in the grammar of different styles, that the student easily bears with the occasional philological lecture, which is in itself always instructive and interesting. A marked characteristic of the book is an abundance of quotation, and these extracts from all sorts of writers and every age are singularly excellent in matter and usually worth reading on their own account. Mr. Earle is prone, too, to discussion of questions which, if touched upon by rhetoricians, are seldom well treated. The volume is, in fact, full of various thought, conservative, well balanced, and sound in conclusion.

The author begins with the vocabulary, which he treats historically as native English, Romanic, and Latin; passes on to a treatise on grammar which is singularly forcible, and not more revolutionary than there is need of; examines the common characteristics of style—lucidity, variety, and euphony—but with nothing of the tediousness and perfunctory repetition of commonplace usually found in such chapters; explains what idiom is, speaks of style as the habit of an author's mind, and winds up with a novel and excellent history of the development of English prose through a thousand years. From a work so comprehensive and varied we can here extract but little, merely to serve as a sample, and we can touch upon only a few of the topics which the author treats episodically, but which are a main attraction of his pages.

He looks upon grammar as the logic of thought, and from that point of view analyzes the parts of speech and the linking of them together. The more quotable portions of this admirable exposition have to do with special words and usages. He especially reprehends the practice of despatching words by labelling them, as where he says that not every *a* is an indefinite article [two men of a mind] nor every *the* a definite article [the more the merrier]. He does not discard the double genitive, "the picture of the king's," nor does he decide against placing the adverb or phrase between the sign of the infinitive and the verb in all cases; he observes that, although the practice is new and growing common and is usually unnecessary, yet when the verb is active and draws after it a long object-clause, there is a gain in so putting the adverb, rather than after the clause, in case it cannot conveniently go before the *to*, and in this he is clearly right in the instances given. The tendency to give the modifying phrase before the main statement, in order that the reader may not have to correct the idea after having received it in an unlimited form, is also obeyed by this habit. The change may be looked on as a natural and useful development, and the practice as one to be employed or not according as it makes the sense easier without awkwardness, or contributes to euphony or to proper emphasis. Another mooted matter in which Mr. Earle decides against the pedagogue is in sustaining the use of the separable particle at the end of the sentence, as in "the man whom I was talking with." This usage is the English idiom, and the newer form, "with whom," is a French importation and more accepted only because it is a later fashion. Dryden first attempted the reform; but the old way is often to be preferred for naturalness and grace.

The remarks made upon the pronouns, especially the relatives, are too various to extract, but they are all to the point, and contain excellent suggestions, as obscurity and awkwardness lie more in them than in any other part of

a sentence. The defence of *but* as an adverb, the long plea for the subjunctive mood both as a help to meaning and to dignity, the discussion of the Saxon genitive in *s* and the French with *of*, the remarks on *they* as a demonstrative, and the frequent references to the results in language of the encroachment of the passive on the active verb, are instances of the scope and character of the entire treatment of the grammatical and idiomatic sections. Mr. Earle defends idiom, though not without a perception of some of its disadvantages much more than compensated for by its gain; and though he says a day may come, and may not be far distant, when there shall arise "a new world-English which will bear the same relation to vernacular English as Hellenistic Greek bore to that which flourished upon Hellenic soil," we hope that the diction of our Polybiuses will be much longer in coming.

In the less technical part the author raises the question about poetical prose among the first. He warns the young writer that as prose is fed by poetry in diction, and as there is an excitement of the mind in its first effort which naturally induces a heightened language, he should be especially careful to avoid poetical phrase; but he adds the excellent advice that the reading of poetry is the best resource of one who would write prose well. He goes further than this, and opposes Mr. Masson, for example, who in praising De Quincey would have us believe that poetry is only a heightened form of prose, so that prose may approach poetry without ceasing to be itself. Mr. Earle agrees with Coleridge and Arnold that poetry is organically different from prose, has a different logic and evolution. He says well that though in early ages the two were confused, this very confusion is a sign of immaturity. The necessity of observing the distinction between the two is, he says, "characteristic of mature and well-developed literature when this separation is firmly established and universally understood." The same confusion of the two is noticeable in the decay of literature. "The prose of the whole silver age, from Tacitus down to Boëthius, is deeply tinctured with manifest poetry. The great prose author of the eighth century is our Venerable Bede; he is in every respect the best writer of those ages; but even he, when he warms with his subject, is apt to import whole phrases of Virgil," and Mr. Earle adds the reason for this: "The cause is manifest; it belongs to the immortality of poetry. Prose is essentially a thing of the present; poetry is for all time. In times of literary decay there are no prose models; those who have literature at all have it from the old poets." In connection with this decision against poetical prose, we add the acute criticism of Carlyle's 'French Revolution': "Teeming as Carlyle's diction is with poetic elements, the diction is not poetic; the whole work may indeed be thought of as an epic poem, but the diction hardly ever takes a poetic flight. We may call it wild or furious, enthusiastic, spasmodic, or dithyrambic prose; but we cannot call it poetic, we cannot deny it the name of prose."

Of discussions similar to this there are several in the volume which tempt us aside; but it is necessary to come to the concluding chapters, which sketch the history of English prose, and, by the help of copious extracts, give a survey of the whole field. Mr. Earle opposes Arnold to a certain extent by combating the latter's doctrine that our prose is the creation of the eighteenth century and owes something to France. Our prose, says Mr. Earle, dates from earlier than the eighth century, and had two periods of culmination before the one mentioned. The first was in the tenth century, when a prose was attained that was the possession of the learned and cultured class, as Latin was, and which had such attraction that for three centuries it was remembered and imitated. The Norman conquest overwhelmed it, and substituted French for Latin models, while it performed the great service to our tongue of thrusting English down to be the popular language for four centuries of obscurity. When English was again written, it had become a people's language and was never to be the possession of a caste. In this, Mr. Earle, observes, English had the same fortune as classic Greek, and alone of languages was so favored:

"The English prose to which we have now attained at the close of the fifteenth century was the most popular vehicle of communication among men that was ever produced upon so extensive an area. This broad quality of popularity is one that Latin never possessed, least of all in its golden age—and indeed there is but one example either in the ancient or in the modern world that can be compared with it. Greek prose from Herodotus to Demosthenes had this quality of popularity: Greek literature grew up encircled by the sympathies of the body of the people and identified with great popular assemblies."

The special way in which this union of English in books with that in the mouths of men was brought about was, of course, the Bible translations and the Prayer Book, in which, as we now have them, there is embodied a century of English diction. In connection with this, Mr. Earle speaks of the different fortune of Luther's Bible, which was the work of an individual who endeavored to make his usage the common language. He succeeded in making his dialect the literary form of the writers, but not the cast of his diction. German diction is still Chancery diction, and in consequence of this only partial success of Luther's Bible the literary language in Germany has never been the national tongue. It belongs, like our tenth-century English, to a class. The danger which every language encounters of becoming a scholar's tongue, was met with in the Euphuistic movement and more markedly in the Latinizing period of Hooker and his fellows, who endeavored to use the period to an extent which English does not allow of, and the attempt outlasted Hooker. From this development, which really threatened English literature, Mr. Earle thinks we were saved by the journalistic and easy-writing authors, of whom Roger L'Estrange was the pioneer and De Foe the most memorable. This service of continually drawing English back from conventional and learned or cultivated forms to the spoken word of the common people is still mainly performed, Mr. Earle seems to think, by journalism, for the diction of which he has an unusual respect, though it should be said that he seems to have in mind the leading articles of the London dailies when he speaks of journalism. Our present usage is attributed by him to Dr. Johnson, whom he thinks the greatest master of the language, and on whose sentences he declares the authors of this century have really formed, consciously or not, their structure. Dr. Johnson marks the third culmination of our prose, therefore, as its history is here told. In these three climaxes, the tenth, fifteenth, and eighteenth centuries, we have a treasury for the replenishment of our vocabulary and phrase structure incomparably beyond anything that other modern nations possess; and Mr. Earle ends his work with an appeal for a wider study of the older language and appreciation of the excellence of its literature in style. It is only a few years ago that we discovered to our surprise how well Wycliffe wrote, he says; and the lesson ought not to be lost upon us.

In the foregoing exposition we have done but scanty justice to the interest and especially the suggestiveness of this work, and now have space only to add that, apart from the grammatical, the reflective, and the historical portions of the volume, we have only praise for the direct advice given to the young writer. The author does not tell him to use monosyllables, or Saxon words, or short sentences; and that is something to be thankful for. The vocabulary of the fifteenth-century English is the best, and must be the ground of any style, and its Romanic elements form a large part of its dignity and charm as well as of its force, naturalness, and reality; the number of syllables is a matter of utter indifference; and as to the length of the sentence, variety requires sentences of all lengths, of direct and inverted construction, of relative and disjunctive forms, of groups of adjectives of all numbers, and so on. Any advice which involves a young writer's cutting himself off from any part of the resources of the language, whether in vocabulary or construction, is bad advice. It may take time for him to learn how to manage his wealth, but he cannot spare any of it in the long run. Mr. Earle's freedom from the pettiness of rhetoricians' rules and their solemn maxims of perfection is refreshing; his judgment is governed by good sense; he has no traditions, and does not find it needful to quote Campbell and Blair. He has put that behind him, if he ever regarded it; and the tyro will profit if he can do the same and follow the hints that so good a student of prose as Mr. Earle is will give him.

The Exempla of Jacques de Vitry. Edited by Thomas Frederick Crane, M.A., Professor of the Romance Languages in Cornell University. London: Published for the Folk-Lore Society by David Nutt. 1890.

JACQUES DE VITRY, preacher of the crusade against the Albigenses, afterwards Bishop of Acre, and active in the Sixth Crusade, was one of the most eminent preachers of the first half of the thirteenth century. Not the least of the qualities which led to his popularity was his employment of various sorts of stories, designed to illustrate his subject and to lead up to the moral which he wished to draw. The numerous *Sermones Vulgares* which he left behind contain a great stock of these stories, called *exempla*, whose attractive character led to a demand for separate collections of them, for the use of later preachers. A number of such collections now exist, many of them, indeed, containing *exempla* that were never used by De Vitry at all, but which were for centuries attributed to him. It was not until 1868 that it was shown that the real *exempla* were to be found in the *Sermones Vulgares*, from which they had been gathered by different hands into collections of various degrees of merit. Although other scholars have published selections from the *exempla*, we believe that we owe to Prof. Crane the first complete edition, based on a careful study of the MSS. of the *Sermones*, and of the *Exempla* themselves. He gives us a sketch of the author's life, and an account of his works and the MSS. which contain them, followed by an essay on the use of *exempla* by mediæval preachers, including the 'Gesta Romanorum' and the 'Scala Celi.' Then come the 315 *exempla* of De Vitry in the original Latin of the period. Finally, we have an analysis of each story, with an account of the later ver-

sions in which it is found, and, as far as possible, of the sources in which it occurs. For we have to deal here, not with parables invented by De Vitry himself, but generally with popular tales, many of them very old and probably familiar enough to the audiences whom they were intended to interest and amuse. They were drawn from all sorts of sources, indirectly of course, even as far back as the Æsopian, and hence their attraction for the Folk Lore Society. They are of a very varied nature, and after reading some of them we are not surprised to learn that it was sometimes found necessary to check a tendency to go beyond bounds with stories unsuited to the sanctity of the occasion. But not all were of this dubious character. Miracles, possessions of devils, wonderful cures, apparitions of saints, fables of birds, beasts, and men, follow hard on each other in constantly changing array.

Prof. Crane has excellently done his editorial work, and the book throughout gives evidence of scholarly research and careful criticism. We have only to suggest an earlier source than St. Ambrose for the fable about the stork cared for in its old age by its young; it is found in Solinus, Pliny, and Aristotle. We conclude this notice with one of the shortest but not the least witty of the *exempla* (No. 162):

"Audivi de quodam carnifice qui carnes coctas vendere consueverat, cum quidam, ut melius forum haberet, diceret ei: 'Jam sunt vii anni quod ab alio carnes non comparavi a vobis.' Ille valde ammirans respondit: 'Tanto tempore hoc fecisti et adhuc vivis?'"

In the words found at the end of some of the *exempla*, "Moraliza sicut vis." For our own part it is a sort of negative consolation to find that butchers were a proud and haughty race even in the days of yore.

Our Early Presidents, and their Wives and Children, from Washington to Jackson. By Mrs. Harriet Taylor Upton. Illustrated. Boston: D. Lothrop Co.

THIS is a "gift book," showy on the outside and profusely illustrated within. It aims to give the home life of our first seven Presidents, who, the author tells us, are known as the "historic Presidents." It is a work of considerable research, the family treasures in the way of correspondence, portraits, jewels, and other heirlooms having been freely drawn upon, thanks to what the author acknowledges to be a most generous unreserve on the part of the representatives of the Presidents, in laying open their most delicate stores. The story of the families is told with considerable minuteness and an obvious interest in every personal detail. There is an abundant flow of kind feeling on the part of the author to every mortal person, child or servant, at all connected with the Presidential families. And this runs into an absolute affectation of intimacy in the style, as if she had been a constant guest at Mount Vernon, Quincy, Monticello, and the rest. Every child has the adjective "little" prefixed to its name, and abundant speculations are introduced as to what Charles Adams or Payne Todd was doing and thinking on given occasions. The various members of the seven families, whether serious or playful, are so uniformly charming and delightful that one cannot help feeling glad the book did not appear when Thackeray was alive, for he would surely have found material in it for a *Round-Table* paper on "The Court Circular in a Republic." This kind of baby-talk is much to be regretted, for it weakens a book which otherwise appears to be thorough, authentic, and useful, both for the reading matter and the illustrations.

One or two mistakes occur, mostly slight, but disfiguring. The Adams family at home were Congregationalists, not Presbyterians (p. 313). John Quincy Adams was elected by the House of Representatives, not the Senate (p. 365). Van Rensselaer and Breckinridge should not appear in disguise as Van Renssalaer (p. 321) and Breckenridge (p. 382). Queen Hortense looks absurd as "Hortènse" (p. 276). And be it said for the benefit of other writers than Mrs. Upton, there is no such word in English as "Madame" (p. 130); "Madam" is the spelling of all the great classical writers in our language. 'Rollins' History' (p. 94) will hardly be found in any library. Such mistakes might easily be corrected if a second edition were called for.

Insecta. [Boston Society of Natural History. Guides for Science-Teaching, No. VIII.] By Alpheus Hyatt and J. M. Arms. Boston: D. C. Heath & Co.

"THIS Guide," its authors say, "is a series of replies to questions which have arisen in the minds of its authors while teaching." By following out this idea, a very useful little book has been produced, which, while presenting nothing original, yet does present in a very compact way the elementary principles of insect anatomy, physiology, and classification. An excellent "synopsis" precedes the text and outlines the matter contained in each chapter. The characters common to insects, anatomical and physiological, are first given, and then each order is separately taken up and considered, beginning with the *Thysanura* and ending with the *Diptera*. Sixteen orders are recognized and popularly characterized, some of them very briefly indeed. This is essentially a handbook for teachers, especially valuable to such as have to impart an elementary knowledge of the subject. Not the least part of its advantages consists in the numerous references to publications in which the points brought out can be more fully studied. In a compilation of this kind, of course, each order is treated by itself, and there is no attempt at homologizing parts, or at attaining a uniformity of nomenclature in all orders. The plates usually illustrate the prominent structural characters of an order.

BOOKS OF THE WEEK.

Austin, Alfred. The Tower of Babel: A Celestial Love-Drama. Macmillan & Co. $1.75.

JUST READY:

Taine's 'Modern Regime.'

By H. A. TAINE. Translated by John Durand. Vol. I. 12mo, $2.50.

The New York *Times* says: This volume "opens with a remarkable study of Napoleon Bonaparte. It is a careful, thorough analysis of his character, and presents him more impartially and comprehensively than any previous writer has done. . . . So trenchant and critical a review and survey of past and present as this volume constitutes has not seen the light for many a day."

Seashore Lands.

ON THE MAINE COAST AND OTHER PARTS OF THE NEW ENGLAND SHORE. Having made a specialty of these lands for over ten years, I act as agent for purchase and sale. A number of beautiful shore, island, and peninsula properties on Penobscot Bay, on the "Camden Shore," at "Islesboro," the Fox Islands, and the other principal points now being rapidly developed. These lands generally range in acreage from parcels of 10 acres to 300 acres, have beautiful rocks, trees, beaches, and harbors, and comprise some of the few remaining tracts now purchasable at prices approximating farm values, and offer variously some of the best opportunities for gentlemen wishing independent estates for summer occupancy or for investment. For details, circulars, photographs, and particulars address

J. Murray Howe, 27 School St., Boston, Mass.

Foreign Books, Subscription to foreign periodicals, Tauchnitz British Authors. Catalogues on application. CARL SCHOENHOF, 144 Tremont St., Boston.

Coast of Maine.

CAPE ROSIER.

The lands of the "Cape Rosier Associates" on Penobscot Bay, 50 miles nearer Boston and the West than Bar Harbor, Mt. Desert, are offered for sale in parcels of five and ten acres and upwards. These lands comprise over ten miles of almost continuous shore-frontage in one of the boldest and most beautiful sections on the coast, twelve hours' journey from Boston. They front upon fine harbors, have beautiful rocky shores, beaches, woods, and mountain views. The drives along the shores and among the hills are very varied and beautiful. New wharves have been built, and new connections with daily trains and steamboats established. In these lands is offered an exceptional opportunity to purchase for very small sums fine and perfectly protected seashore estates. The lands will not be sold for speculation or in small lots.

The Nation.

NEW YORK, THURSDAY, JANUARY 22, 1891.

The Week.

THE effect of the passage of the Silver Bill in the Senate was to knock down the prices of almost everything at the Stock Exchange, including the price of silver bullion, and to put up the rate of sterling exchange to near the gold-shipping point, although, simultaneously with the advance of sterling, there was an importation of $200,000 gold shipped from the other side a week ago. This is the course of things in the business world which will become more pronounced and serious just in proportion as the public shall be of the opinion that the bill is likely to become a law. Enterprise will be, in fact has already been, checked in more than one direction. We know that the influx of capital from abroad has been, for the time being, stopped. The same reasons which impair confidence in our securities abroad will impair it at home, and stagnation will be the result. The promising prospects which ensued upon the termination of the recent semi-panic will be extinguished in a profounder gloom as the free-coinage policy progresses. The most we can hope for under the circumstances is, that the bill may be killed in the House or vetoed by the President, and a campaign started on the silver issue at once. Mr. Carl Schurz has furnished a valuable interview to the *World* on this point, in which he narrates an experience of his own. "I have always found," he says, "that when such fallacies, especially those having a streak of rascality in them, are intelligently discussed and vigorously exposed before the people, it will turn out that the American people, at least a majority of them, are much sounder in their principles than their pretended political leaders."

The friends of sound money ought to give the widest possible circulation to the speech delivered by John Sherman against the Free-Silver Bill on the 13th of January, and published in the *Congressional Record* of the 15th inst. It is at once a most cogent and powerful exposition of true doctrine on our financial issues, and a most unsparing and convincing exposure of the heresies now current. In closing, the Ohio Senator made an exceedingly strong appeal to his Democratic associates in the chamber, which, although it failed of immediate effect upon them, must have its influence upon their constituents. He reminded them that they "represent communities that have other interests than the mining camp"; he told them that they knew that "when you touch the Democratic heart, there is back of this expedient of the hour the strong and determined sympathy for the old ideas of Andrew Jackson"; he declared that "the common people of our country of both parties, as Mr. Lincoln called them, believe in hard money as the basis of all their affairs." He proceeded:

"Take the Eastern States represented by Democrats, and the Southern States. Are they willing to risk this sudden change? Is this a mere contrivance for the hour? But if you commit yourselves to this policy now, next year, when you have more responsibilities than now, you will feel the burden of that commitment. It is not necessary for me to remind you that during four years of a Democratic administration you did not dare propose any of these measures. You kept as quiet as possible. No Alliance then could have driven you into an arrangement for the free coinage of silver. You have the responsibilities now. The great party to which I belong, which for a quarter of a century and more has had the general control of the Government of our country, is willing, when you can get strength enough from our side or from any quarter to have a majority of this body, to transfer to you whatever power and responsibility exists, and upon you rests that responsibility—not upon the minority of our friends, not upon the few on our side who join in this movement, but upon that great and solid party which claims to have existed since the foundation of our Government. If you see your way clear to turn your backs upon the policy of Benton, and Jackson, and Jefferson, and Tilden, and Cleveland, do so; make your own terms; but, sir, in doing so you depart from the standards of the fathers, you depart from the teachings of the great men who laid the foundation of your powerful organization."

Senator Edmunds takes counsel of his fears when he gives up the fight against free coinage, and says that we shall have to stand the experiment. "The epidemic," he says, "is more general now than the one which was met by the Republican party when Gen. Grant was President, and which he checked with his veto message." Let us see. The Inflation Bill of 1874 was passed by a vote of 29 to 24 in a Senate of seventy-two members (two seats being then vacant), while free coinage the other day received 39 yeas to 27 nays in a Senate of eighty-eight members. The Democrats made a better showing in 1874 than in 1891, seven voting against inflation and only six in favor; but the Republicans were far more divided then than now, 22 being recorded for inflation and but 17 against (counting among the latter three "Liberal Republicans"), while last week there were only 15 Republicans for free coinage and 26 against. Both of the Republican Senators from Minnesota (one of them Mr. Windom), both of the Republican Senators from Iowa (one of them Mr. Allison), both of the Republican Senators from Illinois, one of the two from Michigan, and one of the two from Wisconsin, were victims of the "epidemic" of 1874, whereas that of 1891 has not a single victim from all of those great Western States. The admission of fourteen Republican Senators from seven new States since 1874 has helped the "cheap money" side a little, but not much, for six of the fourteen are against free coinage. The East is certainly as sound on the silver issue as on that of inflation, while in the great States of the West the outlook for a hopeful fight against a financial craze is far more encouraging now than it was seventeen years ago.

A movement has been started in Boston in favor of sound money which is deserving of imitation in every business community in the United States. It had its beginning in a call issued by Mayor Matthews for a conference to oppose the free coinage of silver. The call was non-partisan, and the leading Democrats as well as the leading Republicans of the State were included in the invitations. There can be no doubt that these gentlemen had been consulted beforehand and had given their adhesion to the movement. Their action will certainly arrest the attention of business men elsewhere, and ought to be followed up immediately by a similar meeting here. The success of the free-silver movement thus far has been due to the absence of organized opposition. An opposition which takes no step to make itself felt in legislation and administration is practically non-existent. Whatever its latent strength may be, its influence will be absolutely nil unless it takes form and shows fight. We believe that there is a sufficient body of public opinion in the country to beat the free-coinage bill and eventually to put an end to the present dangerous Silver Law (of which nobody is really in favor except as a compromise), if that public opinion is ever organized and properly directed.

The situation being what it is—we say it with sorrow and humiliation—the nomination of Hill for the Senate is probably the best disposition that could be made of him. We think it may be said advisedly that he is the first Governor of New York of whom all classes and conditions of men might reasonably and justly feel ashamed. The Governor's chair of this great State has on some occasions been won by means which nobody would venture to justify openly, and has been held by men of slender capacity and low aims. In this it has shared the fortune of all great places in all civilized countries. No community can always lay hold of the right man for any high office. But Hill is the only Governor of New York who, besides being bad, was not ashamed of his badness, and who openly and persistently allied himself with the worst elements of his party to make plunder of the public fortune. He is the only one who has organized the vicious and the corrupt for resistance to every attempt to improve political morals, and who has gloried in his success. It is only by considering what might have been done during the past six years for the purification of State politics by a Governor possessing Hill's capacity as a manager and Hill's power over his party, in the way of ballot reform—in the way of regulation of the liquor traffic, in the way of improving municipal government, in the way of discouraging intrigues for purposes of public plunder, in the way of creating, especially among the younger men, a better tone with regard to the end and aim of public office—that we get the full measure of Hill as a State curse.

That the best and, indeed, the only way of getting rid of him should be the bestowal on him of the greatest honor the State has at its disposal, by sending him to the United States Senate, has an air of bouffe about it. It savors of the political arrangements of the Grand Duchy of Gerolstein, but there is really wisdom in it. It is not an expedient which brings tears of pride to the patriot's eye; but in an age which sees a notorious embezzler of the public money the manager of a great party and the representative in the Senate of a great State, our use of the Senate as a place of deposit for Hill must meet the indulgence of the sternest moralist. He is booked for a place where his powers for evil will be small, and where the feebleness of his intellectual powers, in the proper sense of that term, will speedily reduce him to comparative obscurity. The Senators are not just now a galaxy of talent, but they are not awed or dominated by low cunning.

Two useless Senators were laid on the shelf by the Republican party on Thursday —Blair of New Hampshire and Farwell of Illinois. Blair has been rather worse than useless, being really a dangerous crank. Whether his successor, Gallinger, will prove in any degree better cannot be safely predicted, but the doctrine of averages leads to the opinion that he cannot be worse. It is something in Gallinger's favor, too, that he has earned the severe reprobation of "Bill" Chandler in the domestic arrangements of the party in New Hampshire. Farwell has been useless as a Senator from the beginning. In fact, he never had any quality to commend him to the office except skill as a purveyor of patronage. Even here he failed under Harrison, because Harrison would not give him the offices he wanted. It is the business of a purveyor to purvey. If for any reason he fails in this, he ceases directly to be of any use. A non-purveyor may offer the excuse that the President would not listen to him, but it is the first requisite of the true dispenser of patronage to have patronage. The local beneficiaries will naturally and properly say that if the cow gives no milk, a new milker must be tried. Gov. Oglesby, who has received the caucus nomination, although not yet the election, is an ex-Senator of the "rough and ready" school, a man of good character and abilities, whose worst mistake in public life was playing with the East St. Louis rioters and incendiaries while he was Governor of the State, at a time when Gov. Rusk of Wisconsin was serving out cold lead to a similar mob in Milwaukee.

The letter from the Navy Department to Commander Reiter, refusing him a court-martial, is more unbecoming and even brutal in tone than the first one dismissing him from his ship. It could not be couched in more insolent and contemptuous language if he had surrendered in action without fighting, or fled before an inferior force, although its sole object and use was to inform him that he had failed to ask for a court-martial at the proper time, and that in any case he had no legal right to it. Somebody with a sense of social and official propriety ought to have been employed by Secretary Tracy to draft the letter in which this information was conveyed. The terms of the letter are the more reprehensible because it undertakes to pronounce Commander Reiter guilty of some legal offence which the Department has carefully refrained from defining. Neither he nor the public has, we venture to assert without having had any communication with him, ever been allowed to know what rule of international or municipal law he violated at San José on the 28th of August last. What the Department has to d him is that it disapproved of his conduct on that occasion, but for what legal reason it disapproved of it does not appear; and yet one of the reasons given for refusing him a court-martial is, "that, in determining questions of law arising upon undisputed facts, the Department does not require the assistance of a court-martial." But what "question of law" has the Department "determined"? Not one that it ventures to publish in black and white. We infer from its confused journalistic abuse of Commander Reiter for doing or not doing something or other at San José, that it believes the commander of a public ship can, in his discretion, resist the local police in executing a warrant on board an American merchant vessel in a foreign port; but it has not had the audacity to lay this down as a rule of any "law" known to civilized men. Nor has it ventured to say what was the breach of international obligation committed by the Guatemalan Government which Commander Reiter ought to have resisted by force, and for which the State Department ought to ask for satisfaction. The case has, however, an importance far transcending the particular injustice done to him. The official vituperation of him, confused though it be, will undoubtedly operate as an instruction to other officers to assume powers in foreign ports to which they have no legal right whatever, and the exercise of which may get us into serious international trouble, ending either in war or humiliating retreat. For this reason we sincerely trust that somebody in Congress will take the matter up and make it the subject of an inquiry. If this Congress has not the time, it ought not to be forgotten in the next, when there will be no difficulty in getting hold of Mr. Tracy and making him go publicly through his process of "determining questions of law arising on undisputed facts." It is of the highest public importance that his way of doing this should be examined.

There is a very interesting contest pending over the reappointment of Gen. Corse as Postmaster at Boston, whose term is about to expire. Gen. Corse was one of President Cleveland's appointments, and though vigorous efforts were made when President Harrison first came into office by partisan Republicans in Massachusetts to have him removed, they were not successful. He has been allowed to serve out his term, and has performed the duties of his office so acceptably that Boston citizens of all parties are now requesting his reappointment. This is the aspect of his case which is perplexing the President and good Mr. Wanamaker, and is causing untold annoyance to Senator Hoar, who, together with Henry Cabot Lodge, ex-Gov. Long, Congressman Greenhalge, Stove-Polisher Morse, and a few other Republicans of similar type, is in favor of having Gen. Corse's Superintendent of Mails appointed as his successor. They would thus get rid of Gen. Corse and at the same time preserve the appearance of not being too partisan in their political course. Senator Hoar admits, however, that there are Republicans in Boston who think that Gen. Corse should be continued in office, and he says the number of letters which he gets from such Republicans has already reached fifty, and the stream still flows on. He really does not know what he will do about it. To add to the complications, the Machine Republicans are in the field with two candidates after their own hearts, both thoroughgoing partisans. They believe in taking possession of the office openly, "without any nonsense" of the Lodge variety. The trouble lies mainly in finding an excuse for not reappointing Gen. Corse, who, in addition to having been a brave soldier, has been an admirable official.

The New Haven *Register*, in an exhaustive review of the vote of Connecticut at the last election, shows in a novel form how in the State Legislature the present antiquated Constitution benefits the Republican party. Towns represented in the lower house by 117 Democratic members polled at the last election 92,235 votes, while the towns represented by 133 Republican members polled only 42,019 votes. With 50,216 majority in the towns which they represent, the Democrats are in a minority of 16 in the lower legislative body. In the Senate the Democratic majority in the districts calculated on the same plan is 72,480 for the whole State. The Democrats now have a majority of ten in the Senate; but a Democratic majority appears there for the first time in many years, since the districts have been "gerrymandered" in the Republican interest. To show the more regular condition of things in that body, we may cite the fact that at the election of 1888 its seven Democratic members, out of the whole number of twenty-four, represented districts which cast 64,016 votes, or about three-sevenths of the vote of the whole State. At present, putting the two houses together, the Democratic members represent 195,840 votes, while the Republicans in both branches represent only 73,144 votes; yet the Republicans have a small majority on joint ballot, with which to elect a Republican United States Senator, and, in the event of the failure of a clear majority over all, would put in Republican State officers, as has heretofore been done three times in succession. The figures show clearly the working in the State of the unjust majority

law, out of which the present muddle at Hartford has grown. It shows, also, as a whole, a condition of affairs acutely suggestive of violence and revolution. The wise policy of a State in such plight is promptly to reform provisions of the Constitution which, so long as they continue, must foment discord and discontent.

The English Nonconformists are having a hard time in the newspapers defending themselves against the attacks of the Unionists, now touching the morality of the irrelations with the Irish Home-Rulers. The Unionists are flushed with the encouragement given them by the result of the O'Shea divorce case, and are now pressing the Nonconformists hard to know why, if they are so much shocked by Parnell's adultery, they were able to stand the Irish outrages during the past six years. The ruin of every description which has come on Parnell's personal character is undoubtedly very embarrassing for the Nonconformists, for they in a measure guaranteed him to the British public. But the accusation of complicity in or condonation of the outrages, based on willingness to act in public with the Home-Rule leaders, is one of the oldest and best-worn weapons in the Conservative armory of all nations. It did much service in the English newspapers, during the American Revolution, against the Americans on account of the persecution of the Loyalists; and during the French Revolution every man who rejoiced in the overthrow of the monarchy was held by some to be a confederate of the Septembrist assassins, or an admirer of Marat and Robespierre. So, also, during the Italian struggle for independence, the friends of Italy were exposed to the charge of responsibility for the wickedness of the Carbonari, and of sharing in Mazzini's views about assassination. It is hardly necessary to recall, too, the way in which, within a very few years, the Democratic leaders both at the North and at the South were held responsible for the Kuklux outrages. The truth is, that there is no question of morals older or nicer than the question how far each man who takes part in a political movement is responsible for the behavior of all the others, particularly when the movement is a revolutionary one.

The mode in which the English Ministry is dealing with Irish distress is a fair illustration of the absurdity of the way in which Ireland is governed, and of the abundance of the excuses under which even the most unreasonable Home-Rulers may take shelter. Mr. Balfour, we need hardly say, is now the Government of Ireland. He has never lived in Ireland, and is separated from the people of that country not only by great ignorance of them, but by both intellectual and caste contempt. There is, therefore, an almost Turkish monstrosity in making him their governor, with semi-martial powers, particularly as one of the Tory rules of Irish administration is not to pay any heed to what the Irish representatives in Parliament say. Under this rule, when some of these representatives, in September last, announced the prospect of a famine in certain parts of Ireland, and proposed to ask subscriptions to relieve the prospective distress, Mr. Balfour, who was then playing golf in Scotland, and had not the smallest knowledge of the facts, announced, in a letter written on the 3d of October, that the idea of any general distress in Ireland was "wholly absurd," and that the information given about it by the Home-Rulers was "obviously doctored for political purposes." As soon as he had finished his golf he went to Ireland himself, where he ought to spend most of his time, and found out what the dismal truth was, and he has now started a private subscription for a relief fund to which he says a "rapid and generous response is being made," although in the October letter he said, when deriding the Irish subscriptions in America, that the "Government measures without question would be sufficient to deal with any real distress which might be beyond the power of the ordinary poor-law to meet." It is the constant recurrence of these caricatures of representative government in Ireland which really keeps the Home-Rule movement on its legs. Were there any steady recognition of the fact that the Irish representation in Parliament was a real representation, and as such entitled to legal respect, even if the members of it were not "nice" men, and were badly dressed, the wind could not be kept in the Home-Rule sails.

The first reading of a new copyright bill took place last month in the House of Lords. The present copyright law of Great Britain rests upon a number of distinct statutes, wholly or partly in force, dating from 1735 to 1888, and is so involved and difficult of interpretation that its codification has long been a crying need. On April 17, 1876, the Queen appointed a commission to make inquiry with regard to the laws relating to copyright. The Commissioners were fifteen in number, including such well-known persons as Sir Henry Holland, Sir Henry Drummond Wolff, Sir Julius Benedict, Sir James Stephen, Mr. James Anthony Froude, and Mr. Anthony Trollope. They submitted an elaborate report on May 24, 1878, which was printed, together with a folio volume of more than 400 pages of the 'Minutes of the Evidence taken before the Commission,' the two volumes forming probably the most important work in the English language relating to literary property. Of the fourteen statutes then in force, the report says: "The law is wholly destitute of any sort of arrangement, incomplete, often obscure; and even when it it is intelligible upon long study, it is in many parts so ill-expressed that no one who does not give much study to it can expect to understand it." The various recommendations of the Commissioners were embodied in a bill by Lord John Manners (now Duke of Rutland, himself one of the Commissioners), and presented to Parliament in 1879, but no legislation resulted. Since that date three new acts, relating to musical and international copyright, have been passed, in 1882, 1886, and 1888.

The new bill has been prepared by the Society of Authors (which fact does not seem to prepossess British publishers in its favor), and is said to combine into one measure the provisions of the Copyright Commission Bill of 1879, the International Copyright Act of 1886, and the elaborate bill for artistic copyright prepared by Mr. Hastings and successively presented to Parliament in 1884, 1885, and 1886, but never enacted into law. It grants protection for the lifetime of the author and thirty years after his death. This term was fixed upon by the Copyright Commissioners in 1878, who named half-a-dozen countries that granted protection for a longer term, namely, life of the author and fifty years, which term they thought excessive and unnecessary. That the movement of copyright legislation is distinctly in the direction of an increased term of protection, however, is demonstrated by the fact that at the present time thirteen countries give copyright for the author's life and fifty years after his death, while two have increased the term to life and eighty years, and three have declared literary property perpetual. By the new bill, authors control the abridgment and dramatization, and, presumably, the translation of their works. Registration of copyright is made compulsory.

The most dangerous attack on Greek in the schools and colleges yet seen, was made the other day in England, at a meeting of the head masters of the Eton, Harrow, Rugby, Winchester, Westminster, Charterhouse, St. Paul's, Clifton, and other schools —one of their usual annual or semi-annual gatherings. It was led, or in fact made, by Mr. Welldon, the head master of Harrow. He advocated the abolition of obligatory Greek both at school and at college, and the substitution of science, or modern languages, on two grounds. The first was the need of adapting education to individual tastes and capacity. The second—in the interest of Greek study itself—was that the Greek language might be left in the hands of those who really loved it and could cultivate it with success—to a sort of classical élite, in short, who would rescue it from its present degraded condition, as the bugaboo of dunces and sluggards. There was a good deal of discussion, pro and con, which elicited nothing very new, but Mr. Welldon came within two votes of carrying his resolution, this adverse majority being obtained by the adhesion of two of the smaller schools. We doubt if anything so ominous for Greek has yet occurred, for the English public schools are its stronghold today, and indeed England may be said to be its main champion. It has never struck such deep roots in education and general culture on the Continent or in this country.

HUMOROUS DIPLOMACY.

THERE is no species of composition, not even pulpit oratory, the proprieties of which are better settled than those of diplomatic correspondence. The object of such correspondence is to keep the peace between nations by means of amicable discussion, and the object of a written or spoken composition of course fixes the style. Every diplomatic despatch, therefore, except in the rare cases (like Menshikoff's communication to the Porte in 1853) which really aim at war, not only is couched in terms of studious politeness, but avoids all rhetorical weapons, whether in the nature of arguments, illustrations, or analogies, which are likely to irritate the opponent by wounding his self-love, and thus make it difficult for him to yield the point without a sense of humiliation. Diplomatic discussion is in form addressed to experts, like arguments before a bench of judges, which always at least affect extraordinary respect both for the character and understanding of the court. It is intended to get you what you want without having to fight for it.

In Mr. Blaine's now voluminous diplomatic compositions, this great rule seems to be totally forgotten. He always begins his discussions, as we said the other day, horns down. He assumes from the outset that his adversary is a tricky, grasping, light-headed fellow, whom he is determined to expose in his true light to a disgusted world. How the affair will end, whether in peace or war, he cares but little, if he can achieve his own rhetorical triumph. As to the form of his argumentation, he is as little concerned about it as if he were still editing the *Kennebec Journal*, and were engaged in holding up the Bangor *Whig* to the contempt and ridicule of the people of Maine. In fact, his view of controversy is strictly journalistic. His despatches are only nominally addressed to the Foreign Minister: they are really meant for "our readers"—that is, for the multitude who are looking on, and know and care but little about the merits of the controversy.

An amusing illustration of this is furnished by the last batch of his correspondence with Lord Salisbury. Salisbury had pressed him hard with American authorities against his claim that the Bering Sea was a *mare clausum*, or, what was the same thing, that, owing to the presence of seals in it, it was "affected," to use the term of the Court of Appeals, with a *mare clausum* quality, and that in it, therefore, the jurisdiction of the United States extended beyond the three-mile limit. The true diplomatic answer to this would have been either a counter explanation of the American authorities, or the citation of some European precedent covering the same ground and likely to impress Salisbury's mind. But the journalistic instinct in Mr. Blaine was too strong for this. In his anger he determined to "corner" Salisbury by producing, not a legal precedent, but a low trick of which his wretched contemporary had at one time been guilty himself. The readers of the *Kennebec Journal* were to see what kind of fellow Boutelle of the Bangor *Whig* was. So he produced, with an air of suppressed rage, the British Act passed in 1816, with the concurrence of Russia, Prussia, and Austria, regulating the custody of Napoleon at St. Helena, and forbidding all foreign vessels not only to land on the island, but to "hover within eight leagues" or twenty-four miles of the coast, the offence to be punishable by the forfeiture of the ships, and to be triable in England as if committed in the county of Middlesex.

That remarkable person "the merest tyro" would, of course, have known that this Act could only bind the subjects of the Powers which assented to it. A very slight examination of authorities, such as a diplomatist engaged in an important diplomatic discussion is bound to make, would have shown Mr. Blaine that Great Britain could not possibly maintain the claim to interdict a radius of twenty-four miles of high seas to such nations as cared nothing about the safe-keeping of Napoleon, and especially to the United States. It could prevent landing on the island, but it could not prevent hovering, backing and filling, tacking, or any other marine manœuvre on the open sea outside the legal limit. One year later, Lord Stowell had, in the British Court of Admiralty, solemnly denied the power of Parliament to make the slave trade piracy or to contravene in any respect the settled law of nations. The *St. Louis* case in which he did this is one of the famous cases in the history of the slave trade, and therefore well known to the Merest Tyro; and yet Mr. Blaine, in his eagerness to smash and pulverize his miserable contemporary, totally overlooked it. Not only did he overlook it, but, in his journalistic fervor, he went on to analyze the operation of this hellish Act, and plunged into an actuary's calculation of Napoleon's expectation of life. It was, he says, in 1816, the same as Wellington's, forgetting that no office would in 1816 have given Napoleon a policy on the same terms as Wellington, as he was well known to have at that period stomachic troubles of a serious character, while Wellington was "as hard as nails." A life-insurance company which treated all persons born the same year as equally safe risks would be a very amusing corporation, but not one in which James G. Blaine would buy stock. But without consulting an actuary Mr. Blaine assumes that Napoleon might have been expected to live till 1852, and thus Great Britain would have kept a circle of open ocean, of twenty-four miles radius, all to herself during a period of thirty-six years, had Napoleon not died. The way in which the case grows on him and increases his ardor as he contemplates it, is delightful; for not only might Napoleon have reasonably lived till 1852, but, during the five years he did live, this British Act denied the liberty of the seas "to 500 American ships bound round the Cape and carrying, to be accurate, 14,000,000 tons of shipping over a space fifty miles wide." The fun of this lies in the fact that there is not a particle of evidence that any American ship ever paid the slightest attention to the prohibition, or was ever warned out of the circle, or ever changed her course on reaching it. The whole contention is an immense journalistic spree. But it shows, according to Mr. Blaine, what a mean, hoggish fellow Lord Salisbury is to

> "deny the right of the United States to assume control over a limited area for a fraction of each year, in a sea which lies far beyond the line of trade, whose silent waters were never cloven by a commercial prow, whose uninhabited shores have no port of entry and could never be approached on a lawful errand under any other flag than that of the United States."

The peroration reminds one of some of the apostrophes at Harrigan & Hart's. As Father Tom said to the Pope, it "makes a hare" of Salisbury, and would entitle the learned author to a high place in the "editorial council" of our esteemed contemporary the *Herald*—a body which puts its foot on the necks of kings, not to speak of the necks of Foreign Secretaries:

> "Is this Government to understand that Lord Salisbury justifies the course of England? Is this Government to understand that Lord Salisbury maintains the right of England, at her will and pleasure, to obstruct the highway of commerce in mid-ocean, and that she will at the same time interpose objections to the United States exercising her jurisdiction beyond the three-mile limit, in a remote and unused sea, for the sole purpose of preserving the most valuable fur-seal fishery in the world from remediless destruction?"

MR. BLAINE'S OWN WITNESS.

OUR Secretary of State is permitted by the President to stake the pending controversy over the seal fisheries and the adjacent waters on the issue whether or not the treaties of 1824 and 1825 intended to include, and did include, Bering Sea, by the words "Great Ocean," commonly called "the Pacific Ocean, or South Sea."

He produces, as a chief witness, Hubert Howe Bancroft, and presents him as an expert worthy of credit. Without accepting or rejecting all that Mr. Bancroft says in his History of the Pacific States, it will be profitable, after Mr. Blaine's endorsement, to observe what he really has said. He regards the Pacific Coast above 42°, which is the present southern boundary of Oregon, "as an undiscovered country" till 1775, and the explorations of 1774–'5 as giving to Spain, so far as mere *discovery* could, all "the northwest coast," but that, nevertheless, Russia from the North "discovered America, and touched the coast as low as latitude 56°," or a little to the south of the present Sitka. About this time Russia claimed vaguely that her possessions extended down to the Columbia River, and Spain pushed hers up to Prince William Sound. In 1788, says Bancroft, the American *fur trade* began in that region, meaning on the Pacific to the south of what is now Alaska; before 1800 forty vessels had visited that coast, and "later the Americans monopolized the trade." No nation protested against it till 1808, when Russia did, and asserted a claim to the *whole* coast down to the Columbia River, or 46°. The United States replied that the Spanish title extended up to 60°, or to what is now the southern coast of our Alaska. Then, in 1821, came the Russian ukase, declaring "the whole of the north-

west coast of America, beginning from Bering's Straits to the 51st degree," to be exclusively Russian. The 51st degree touches the northern point of Vancouver's Island. Secretary Adams rejected the *entire* Russian claim. The treaty between the United States and Russia was signed in 1824. Mr. Blaine contends that it did not include any part of Bering Sea (first named Bering Sea, he affirms, in 1817), extending down to 52° or 51°. By that treaty, Bancroft says, "the boundary was fixed at latitude 54° 40′, beyond which neither nation was to found any establishment or resort without permission of the other, though for a period of ten years the vessels of other nations were to have free access, for trade and fishery, to all *interior* waters of the other's territory." Mr. Blaine contends that it did not include Bering Sea, but covered only the main coast on what is now Canada and the United States, leaving the latter and England to fight over all between 42° and 54° 40′. In 1825, says Bancroft, another treaty was made between England and Russia by which the latter again relinquished all below 54° 40′, "and the broad interior *up to the frozen ocean.*" The United States did not protest against the last-named concession to England, although Greenhow said it virtually annulled our treaty of 1824.

In endeavoring to ascertain the truth of the pending international discussion, it must be borne in mind that the first concession made in 1799, for twenty years, to the Russian American Company, described the area of the concession on the south by a line of latitude (which was the 55th degree) including the chain of islands from Kamtchatka to North America, and south to Japan, and also the Aleutian, Kurile, and other islands "in the *North-Eastern* Ocean." It was renewed in 1821, and again from 1841 to 1862, when the boundary was, of course, changed, says Bancroft, "in accordance with the English and American treaties." The ukase of 1821 defined, in like manner, the southern limit of exclusion of foreigners as latitude 51°, but the treaties of 1824 and 1825—permitting Americans and Englishmen to enter, navigate, fish, and trade—only referred to "*all* parts of the Great Ocean," etc., although "settlements" were restrained by the line of 54° 40′. To appreciate Secretary Blaine's contention that those treaties of 1824 and 1825 did not cover Bering Sea, one should refer to any good map and observe how the peninsula of Alaska, and the chain of Aleutian islands projecting westward from the mainland of Alaska, cut off the North Pacific Ocean from Bering Sea. One must also bear in mind that American and English diplomacy had to accomplish, as best it could, a withdrawal *in effect* of the prohibitions of the ukase of 1821 without a humiliation of Russia. The ukase of 1821 covered Bering Sea, all concede. Is it likely that the United States and Great Britain intended in the treaties to be content with only the waters to the eastward of the peninsula of Alaska, and south as well as east of the Aleutian Islands, leaving Bering Sea to Russia? Mr. Blaine says, Yes!

Mr. Bancroft in his History of Alaska describes with much and admirable detail the rise and growth of the Russian-American Company from 1799 to 1862. He tells how the company, having demanded it, soon saw the folly of the ukase excluding foreign trade. He sets forth how the ukase raised up American and British protests, and, in the end, the traffic was surreptitiously winked at by the company for its own good. He avers (p. 544) that, under the treaties, Americans and Englishmen could freely navigate, fish, and trade "*in Aleutian waters*" for ten years, but that the treaties created remonstrances at St. Petersburg by the company on account of the vagueness of the language used, which might admit foreigners into Bering Sea. The Emperor Alexander paid no heed to the remonstrances, but the Emperor Nicholas did. He addressed himself to our State Department at Washington, and accomplished nothing, but to appease the company he issued another ukase confining foreigners, says Bancroft, "to the strip of coast between the British possessions and the 141st meridian." He adds that no attempt was made to apply the treaties "to the islands and coasts of western Alaska," or, in other words, the treaties, as to those areas, were unexecuted.

It is no doubt true that at the close of the last and the beginning of the present century the theatre of the struggles of rival explorers, fur-hunters, and traders was the region east of the Alaskan peninsula, and bounded by what is now our Alaska, British Columbia, Washington, and Oregon. The Pribyloff Islands were not discovered in Bering Sea till 1786. But the pending question, however it be obscured, is whether or not Russia held Bering Sea as a "shut sea" till 1867, and on that Mr. Blaine's witness, the California historian Bancroft, has much to say in his History of Alaska that is edifying. If Bering Sea was a "shut sea," how did American whalers go from the New England coast to Bering Straits, and through them into the Arctic Sea? In 1842, Bancroft says, thirty American whaling vessels were in Bering Sea, and fifty in 1841. Russia was asked by the Russian-American Company, he says, to send to Bering Sea armed cruisers to preserve it as a *mare clausum*, but she refused, and replied that the treaty of 1824 "*gave to Americans the right to engage in fishing over the whole extent of the Pacific Ocean.*" Bancroft's twenty-second chapter affirms that, forty years ago, Bering Sea was well occupied by American fishermen of all sorts, and that after 1862 the number increased.

COST OF OUR LATEST INDIAN WAR.

GEN. MILES calls official attention to the fact that the Indian war is over by issuing a congratulatory address to his troops, and making efforts to have them returned to their former posts of duty as soon as possible. In his address he gives a rapid summary of the causes of the war and its leading episodes, but he does not go into details, leaving those, presumably, for his official report, or for the investigation which Congress is to make. We trust that sooner or later the facts in this most lamentable but entirely typical Indian war will be brought to light, for they cannot fail to have a salutary effect in putting an end, before many years more shall have passed, to the wretched "spoils" system which was responsible for this as well as for nearly all others of our Indian wars.

Gen. Miles gives in his address no statistics of the losses of life upon both sides, and we must wait for official information on that point, but unofficial figures are obtainable and are not far from the truth. The total number of Indians killed, "bucks," squaws, and pappooses, is placed at 483 by newspaper correspondents who kept a close account of the losses. The total number of soldiers killed is placed at about 30, and the number wounded at about 40. The killed included Capt. Wallace and Lieuts. Casey and Mann, all men of fine character, whose death in the very prime of life was a distinct loss to the service. The chief loss of life among the Indians was at the battle of Wounded Knee on December 29, when the soldiers, under a burst of genuine savage fury, mowed down with the Hotchkiss gun warriors, women, and children, leaving them in heaps, dead and wounded together, upon the snow. The terrible pictures of that slaughter are too fresh in the minds of the public to need reproduction now.

Why was this loss of life made necessary? There is no longer any doubt about the chief cause. The Indians were starved into discontent and revolt through the conduct of the Interior Department in reducing their supplies of beef. Mr. Frank C. Armstrong, United States Indian Inspector, in a letter made public a few weeks ago, warned the Interior Department in April last that trouble was coming because of its policy in this particular. He called the Department's attention to the fact that the supply of beef for the Pine Ridge Agency had been cut down from 5,000,000 pounds to 4,000,000, without previous intimation of such reduction, adding:

"The full allowance of beef should be given them. They complain, and with good grounds, that they were told by the Sioux Commissioners that their rations, etc., should not be reduced; that while this very talk was going on the Department in Washington was fixing to cut off one-fifth of their meat supply, but did not let them know it, nor did the agent know it until they had signed the Sioux Bill. They had a good start in cattle, but have had to kill over three times as many of their own cattle, old and young, as they did the year before; that they have been deceived in doing what they did by the Government, and that they don't get as much now as they did before.

"I think cutting off this 1,000,000 pounds of beef, and thereby forcing them to kill their own young cattle, has put them back two years or more in raising stock, and has created a feeling of distrust, which, unless something is done to repair it, will lead to trouble and bad conduct. They have now killed many of their own cattle, and will next commence to kill range cattle. Already hides and other evidences of this are being found on the reservation borders.

"Men will take desperate remedies sooner than suffer from hunger. Not much work can be expected with the present feeling. The Indians who advocated signing are now laughed at and blamed for being fooled. They don't get even their former rations, and ask where are all the promises that were made. The

Government must keep faith as well as the Indians."

This warning had no effect whatever upon the Interior Department. Not only were the supplies kept down to the reduced limit, but an entirely worthless politician was put in charge of the agency at Pine Ridge to superintend the distribution. After the trouble began, Maj. W. W. Anderson, a former Indian agent of large experience, who had been on the ground and examined the situation personally, said on January 9 last that the real cause of the trouble was the violation of the Sioux treaty of 1876; that he knew personally of many cases in which the Indians did lack food and did not receive the rations to which they were entitled; that the ghost dance had been used to influence some of the young men, but was not the prime cause of the trouble; and that some of the blame belonged to the Pine Ridge agent, Royer, who, instead of remaining at his post when signs of trouble appeared, "ran away to Bushville and called for troops, and then, when he went back to the agency with troops, was harsh and irritating towards the Indians."

There is an abundance of other evidence on this point, but these citations are sufficient to show that this war which has cost us the lives of thirty soldiers and has led to the slaughter of nearly 500 Indians, including many women and children, was due entirely to the mismanagement of the Indian service by the Interior Department. Upon that Department, which was following out the vicious policy of many years' standing, must rest the entire responsibility for this unnecessary bloodshed. It drove the Indians to war by starving them, and then killed off nearly 500 of them to restore them to peace. If there had been an honest man like Dr. McGillicuddy at the Pine Ridge Agency, and if the Interior Department had kept its treaty obligations with the Indians, there would have been no war. Peace came as soon as the Secretary of the Interior confessed his error by removing the agent Royer. No sooner had Gen. Miles got control of the agency, and Royer gone home to his natural place in Eastern "politics," than the war was over.

We observe that Secretary Noble has been "talking freely" of what he thought our Indian policy should be, and that he believed the first thing to be done would be to deprive the Indians of firearms and give them an opportunity to earn their own living. But what is the use of giving them an opportunity to earn their own living when the Government breaks faith with them, cuts down their rations, and starves them into killing their own stock, thus neutralizing their own efforts to better their condition by imitating the methods of civilized men?

THE SCOTCH STRIKE.

THE Scotch railway strike, which is apparently drawing slowly to a close, if not the greatest, is one of the greatest that have ever occurred, not excepting the Pennsylvania strike of 1877 and the Southwestern strike of 1886. Every Scotch line, as well as some of the North of England lines, has experienced it, and nearly every branch of industry, including the northern fisheries, has suffered from it. In spite, too, of the high order of intelligence of the men, and their Scotch sobriety and patience, the strike has had all the usual characteristics of strikes in other places and among other races. The men have undoubtedly had a number of substantial grievances to complain of in the shape of long hours and insufficient wages, for which they have hitherto vainly sought redress; but what seems to have precipitated the strike was that perennial trouble, the refusal of the companies to treat with the labor organizations to which the men belong, or with their representatives in the person of labor agitators—some of whom, by the by, came on from London. On this point the companies have been unyielding, and their obstinacy, as usual, roused a good deal of sympathy with the men among philanthropists both in Scotland and in England. In fact, all attempts everywhere to arrange a *modus vivendi* between employees and employed in all the large industries seem to split on this rock. The men organize in order to increase their strength and give individuals shelter from oppression or persecution; but when the time comes to use the organization for purposes either of offence or defence, it utterly fails. The employers attack it with energy, and invariably, or almost invariably, break it up.

In justification of their course on this point, the companies in Scotland produce two pleas, which events generally justify. They say, in the first place, that the organizations do not and cannot control the men, and that therefore any contract with them would be worthless, because the leaders could not carry it out if the rank and file found reason at any time for breaking it. In the present case every Scotch railway employee is bound by his own signature to give a month's notice of his intention to quit his place; but this did not prevent the present strikers from abandoning their places without notice, just as the strikers on the New York Central did, nor did it prevent them from selecting the very season and the very week of the year when it would cause most inconvenience to the public and most loss to the companies, to abandon their trains and suspend traffic on all the great lines.

In the second place, the companies say that to make a contract with the leaders of the trades unions is to surrender the control of the roads to persons responsible neither to the public nor to the stockholders, and power without responsibility is something which no heads, and especially the heads of labor agitators, can stand. The effect of any such surrender has, in fact, been abundantly manifested in England in the case of the dockers' strike, and in this country in the case of the Reading strike. In the former case the surrender has led ever since to incessant, almost weekly, strikes against the enforcement of the commonest business rules, and in the latter it led to the extraordinary insubordination described by Mr. Powderly in his letter touching the late strike on the New York Central, which he illustrated by mentioning that the engineers on the Reading Road used to stop meeting trains in midway, to discuss labor matters. This is really now the chief difficulty in the way of the harmonious relations between labor and capital in the great industries. What is needed is, that labor should set up some organization capable of fulfilling a contract. Until it does this, corporations, and especially corporations charged with the management of great lines of public traffic, cannot settle labor disputes by negotiation. Strikes will be war, and the weaker party will have to go to the wall.

It is interesting to see how closely the Scotch strike among what may be called a select population has followed the lines of similar strikes elsewhere in the matter of behavior. Trains were suddenly abandoned at the outset in the old way. Then new hands were warned off, first by persuasion and next by intimidation. Then, when the new men began to work the lines, meetings were held to show the awful risks the companies were running in suffering "green hands" to run trains; and, finally, when everything else failed, assaults on the "green hands" began. This is everywhere the final stage, not necessarily of the strike, but of the dispute. For although nearly every line in Scotland is running again as usual, the strike is still "on" the same as ever, and orators are still promising in the public houses the speedy surrender of the companies.

GEORGE BANCROFT.

GEORGE BANCROFT, who died in Washington, D. C., on Saturday, was born at Worcester, Mass., October 3, 1800, being the son of Aaron and Lucretia (Chandler) Bancroft. His first American ancestor in the male line was John Bancroft, who came to this country from England, arriving on June 12, 1632, and settling at Lynn, Mass. There is no evidence of any especial literary or scholarly tastes in his early ancestors, although one at least among them became a subject for literature, being the hero of one of Cotton Mather's wonderful tales of recovery from smallpox. Samuel Bancroft, grandfather of the great historian, was a man in public station, and is described by Savage as "possessing the gift of utterance in an eminent degree"; and the historian's father, Rev. Aaron Bancroft, D.D., was a man of mark. He was born in 1755, fought at Lexington and Bunker Hill when almost a boy, was graduated at Harvard College in 1778, studied for the ministry, preached for a time in Nova Scotia, was settled at Worcester, Mass., in 1788, and died there in 1839. He was a member of the American Academy of Arts and Sciences, was an Arminian in theology, and in later life President of the American Unitarian Association. He published various occasional sermons, a volume of doctrinal discourses, and (in 1807) a 'Life of Washington,' which was reprinted in England, and rivalled in circulation the larger work of Marshall, which appeared at about the same time. He thus bequeathed literary tastes to his thirteen children; and though only one of these reached public eminence, yet three of the daughters were prominent for many years in Worcester, being in charge of a school for girls, and highly esteemed; while another sister was well known in Massachusetts and at Washington as the wife of Governor (afterwards Senator) John Davis.

George Bancroft was fitted for college at Exeter Academy, where he was especially noted for his fine declamation. He entered Harvard College in 1813, taking his degree in 1817. He was the classmate of four men destined to be actively prominent in the great anti-slavery agitation a few years later—Samuel J. May, Samuel E. Sewall, David Lee Child, and Robert F. Wallcut—and of one prospective opponent of it, Caleb Cushing. Other men of note in the class were the Rev. Stephen H. Tyng, D.D., the Rev. Alva Wood, D.D., and Samuel A. Eliot, afterwards Treasurer of the College and father of its present President. Mr. Bancroft was younger than any of these and very probably the youngest in his class, being less than seventeen at graduation. He was, however, second in rank, and it happened that Edward Everett, then recently appointed Professor of Greek Literature in that institution, had proposed that some young graduate of promise should be sent to Germany for purposes of study, that he might afterwards become one of the corps of instructors. Accordingly, Bancroft was selected, and went, in the early summer of 1818, to Göttingen. At that time the University had among its professors Eichhorn, Heeren, and Blumenbach. He also studied at Berlin, where he knew Schleiermacher, Savigny, and W. von Humboldt. At Jena he saw Goethe, and at Heidelberg studied under Schlosser. This last was in the spring of 1821, when he had already received his degree of Ph.D. at Göttingen and was making the tour of Europe. At Paris he met Cousin, Constant, and Alexander von Humboldt; he knew Manzoni at Milan, and Bunsen and Niebuhr at Rome. The very mention of these names seems to throw his early career far back into the past. Such experiences were far rarer then than now, and the return from them into what then was the village life of Harvard College was a far greater change. Yet he came back at last and discharged his obligations, in a degree, by a year's service as Greek tutor.

It was not, apparently, a satisfactory position, for although he dedicated a volume of poems to President Kirkland, "with respect and affection" as to his "early benefactor and friend," yet we have the testimony of George Ticknor (in Miss Ticknor's Life of J. G. Cogswell) that Bancroft was "thwarted in every movement by the President." Mr. Ticknor was himself a professor in the College, and though his view may not have been dispassionate, he must have had the opportunity of knowledge. His statement is rendered more probable by the fact that he records a similar discontent in the case of Prof. J. G. Cogswell, who was certainly a man of conciliatory temperament. By Ticknor's account, Mr. Cogswell, who had been arranging the Harvard College library and preparing the catalogue, was quite unappreciated by the Corporation, and though Ticknor urged both him and Bancroft to stay, they were resolved to leave, even if their proposed school came to nothing. The school in question was the once famous "Round Hill" at Northampton, in which enterprise Cogswell, then thirty-six, and Bancroft, then twenty-three, embarked in 1823. The latter had already preached several sermons and seemed to be feeling about for his career; but it now appeared that he had found it.

In embarking, however, he warbled a sort of swan-song at the close of his academical life, and published in September, 1823, a small volume of eighty pages, printed at the Cambridge University Press and entitled 'Poems by George Bancroft, Cambridge: Hilliard & Metcalf.' Some of these were written in Switzerland, some in Italy, some, after his return home, at Worcester; but almost all were European in theme, and neither better nor worse than the average of such poems by young men of twenty or thereabouts. The first, called "Expectation," is the most noticeable, for it contains an autobiographical glimpse of this young academical Childe Harold setting forth on his pilgrimage:

"'Twas in the season when the sun
More darkly tinges spring's fair brow,
And laughing fields had just begun
The summer's golden hues to show.
Earth still with flowers was richly dight,
And the last rose in gardens glowed;
In heaven's blue tent the sun was bright,
And western winds with fragrance flowed;
'Twas then a youth bade home adieu;
And hope was young and life was new,
When first he seized the pilgrim's wand
To roam the far, the foreign land.

"There lives the marble, wrought by art,
That clime the youth would gain; he braves
The ocean's fury, and his heart
Leaps in him, like the sunny waves
That bear him onward; and the light
Of hope within his bosom beams,
Like the phosphoric ray at night
That round the prow so cheerly gleams.
But still his eye would backward turn,
And still his bosom warmly burn,
As towards new worlds he 'gan to roam,
With love for Freedom's western home."

This is the opening poem; its closing words, at the end of the final "Pictures of Rome," are in a distinctly patriotic strain:

"Farewell to Rome; how lovely in distress;
How sweet her gloom; how proud her wilderness!
Farewell to all that won my youthful heart,
And waked fond longings after fame. We part.
The weary pilgrim to his home returns;
For Freedom's air, for Western climes he burns;
Where dwell the brave, the generous, and the free,
O! there is Rome; no other Rome for me."

It was in order to train these young children of the republic—"the brave, the generous, and the free"—that Bancroft entered upon the "Round Hill" enterprise.

This once famous school belonged to that class of undertakings which are so successful as to ruin their projectors. It began in a modest way; nothing can be more sensible than the 'Prospectus'—a pamphlet of twenty pages issued at Cambridge, June 20, 1823. In this there is a clear delineation of the defects then existing in American schools; and a modest promise is given that, aided by the European experience of the two founders, something like a French *collège* or a German gymnasium might be created. There were to be not more than twenty pupils, who were to be from nine to twelve on entering. A beautiful estate was secured at Northampton, and pupils soon came in. Then followed for several years what was at least a very happy family. The school was to be in many respects on the German plan; farm life, friendly companionship, ten-mile rambles through the woods with the teachers, and an annual walking tour in the same company. All instruction was to be thorough; there was to be no direct emulation, and no flogging. There remain good delineations of the school in the memoirs of Dr. Cogswell, and in a paper by the late T. G. Appleton, one of the pupils. It is also described by Duke Bernard of Saxe-Weimar in his Travels. The material of the school was certainly fortunate. Many men afterwards noted in various ways had their early training there: J. L. Motley, H. W. Bellows, R. T. S. Lowell, F. Schroeder, Ellery Channing, G. E. Ellis, Theodore Sedgwick, George C. Shattuck, S. G. Ward, R. G. Shaw, N. B. Shurtleff, George Gibbs, Philip Kearney, R. G. Harper. At a dinner given to Dr. Cogswell in 1864, the most profuse expressions of grateful reminiscence were showered upon him, though Mr. Bancroft, who was then in Europe, was absent. The prime object of the school, as stated by Mr. Ticknor, was "to teach *more thoroughly* than has ever been taught among us." How far this was accomplished can only be surmised; what is certain is that the boys enjoyed themselves. They were admirably healthy, not having a case of illness for sixteen months, and they were happy. When we say that, among other delights, the boys had a large piece of land where they had a boy-village of their own, a village known as Cronyville, a village where each boy erected his own shanty and built his own chimney, where he could roast apples and potatoes on a winter evening and call the neighbors in—when each boy had such absolute felicity as this, with none to molest him or make him afraid, there is no wonder that the "old boys" were ready to feast their kindly pedagogues forty years later.

But to spread barracks for boys and crony villages over the delightful hills of Northampton demanded something more than kindliness; it needed much administrative skill and some money. Neither Cogswell nor Bancroft was a man of fortune. Instead of twenty boys they had at one time 127, nearly fifty of whom had to be kept through the summer vacation. They had many Southern pupils and, as an apparent consequence, many bad debts, Mr. Cogswell estimating a loss of $2,000 from this cause in a single year, and sometimes they had to travel southward to dun delinquent parents. The result of it all was that Bancroft abandoned the enterprise after seven years in the summer of 1830; while Cogswell, who held on two years longer, retired with health greatly impaired and a financial loss of $20,000. Thus ended the Round Hill School.

While at Round Hill Mr. Bancroft prepared some text-books for his pupils, translating Heeren's 'Politics of Ancient Greece' (1824) and Jacobs's Latin Reader (1825)—the latter going through several editions. His first article in the *North American Review*, then the leading literary journal in the United States, appeared in October, 1823, and was a notice of Schiller's Minor Poems, with many translations. From this time forward he wrote in almost every volume, but always on classical or German themes, until in January, 1831, he took up "The Bank of the United States," and a few years later (October, 1835) "The Documentary History of the Revolution." These indicated the progress of his historical studies, which also began at Round Hill, and took form at last in his great history. The design of this monumental work was as deliberate as Gibbon's, and almost as vast, and the author lived, like Gibbon, to see it accomplished. The first volume appeared in 1834, the second in 1837, the third in 1840, the fourth in 1852, and so onward. Between these volumes were interspersed a variety of minor essays, some of which were collected in a volume of 'Literary and Historical Miscellanies' published in 1855. Bancroft also published, as a separate work, a 'History of the Formation of the Constitution of the United States' (1882).

He was, while at Northampton, an ardent Democrat of the most theoretic and philosophic type, and he very wisely sought to acquaint himself with the practical side of public affairs. In 1826 he gave an address at Northampton, defining his position and sympathies; in 1830 he was elected to the Legislature, but declined to take his seat, and the next year declined a nomination to the Senate. In 1835 he drew up an address to the people of Massachusetts, made many speeches and prepared various sets of resolutions, was flattered, traduced, caricatured. From 1838 to 1841 he was Collector of the Port of Boston; in 1844 he was Democratic candidate for Governor of Massachusetts, but was defeated, George N. Briggs being his successful antagonist, although he received more votes than any Democratic candidate before him. In 1845 he was Secretary of the Navy under President Polk. In all these executive positions he may be said to have achieved success—it was, for instance, during his term of office that the Naval Academy was established at Annapolis; it was he who gave the first order to take possession of California, and he who, while acting for a month as Secretary of War, gave the order to Gen. Taylor to march into Texas, thus ultimately leading to the annexation of that State. This, however, identified him with a transaction justly censurable, and indeed his whole political career occurred during the most questionable period of Democratic subserviency to the Slave Power, and that weakness was never openly—perhaps never sincerely—resisted by him. This left a reproach upon his earlier political career which has, however, been effaced by his literary life and his honorable career as a diplomatist. In 1846 he was transferred from the Cabinet to the post of Minister Plenipotentiary to Great Britain, where he contrived to combine historical researches with public functions. In 1849 he returned to this country—a Whig administration having been elected—and took up his residence in New York. In February, 1866, he was selected by Congress to pronounce a eulogy on President Lincoln, and in the following year he was appointed Minister to Prussia, being afterwards successively accredited to the North German Confederation and the German Empire. In these positions he succeeded in effecting some

important treaty provisions in respect to the rights of naturalized German citizens residing in Germany. He was recalled at his own request in 1874, and has since resided in Washington in the winter and at Newport, R. I., in summer.

Dividing his life between these two abodes, he passed his later years in a sort of existence more common in Europe than here—the well-earned dignity of the scholar who has also been, in his day, a man of affairs, and who is yet too energetic to repose upon his laurels or waste much time upon merely enjoying the meed of fame he has won. In both his winter and summer abodes he had something of the flattering position of First Citizen; he was free of all sets, an honored member of all circles. His manners were often mentioned as "courtly," but they never quite rose to the level of the two classes of manner described by Tennyson—

> "Kind nature is the best, those manners next
> That fit us like a nature second hand;
> Which are indeed the manners of the great."

Neither of these descriptions exactly fitted Mr. Bancroft; his manners were really of the composite sort, and curiously suggestive of the different phases of his life. They were like that wonderful Japanese lacquer work, made up of twenty or thirty different coats or films, perhaps laid on by several different workmen. There was at the foundation the somewhat formal and literal manner of the scholar, almost of the pedagogue; then one caught a glimpse of an executive, official style, that seemed to date from the period when he ordered California to be occupied; and over all there was a varnish of worldly courtesy, enhanced by an evident pleasure in being admired, and broken by an occasional outburst of rather blunt sincerity.

But he matured and mellowed well; his social life at Washington was more satisfactory to himself and others than that he led in New York; he had voluntarily transplanted himself to a community which, with all its faults and crudities, sets intellect above wealth, and readily conceded the highest place to a man like Bancroft. Foreign Ministers came accredited to him as well as to the Government; he was the friend of every successive Administration, and had as many guests as he cared to see at his modest Sunday evening receptions. There he greeted every one cordially, aided by a wife amply gifted in the amenities. He was cordial to everybody, and remembered the father or grandfather of anybody who had any such ancestors whom it was desirable to mention. In summer, at Newport, it was the same; his residence was like that described by his imagination in one of his own early poems—

> "Where heaven lends her loveliest scene,
> A softened air, a sky serene,
> Along the shore where smiles the sea."

Unlike most Newport "cottages," his house was within sight of the ocean; between it and the sea lay the garden, and the rose in Kenmure's cap in the Scottish ballad was not a characteristic more invariable than the same flower in Mr. Bancroft's hand or buttonhole. His form was familiar, too, on Bellevue Avenue, taking as regularly as any old-fashioned Englishman his daily horseback exercise. At the same time he was one of the few men who were capable, even in Newport, of doing daily the day's work; he rose fabulously early in the morning, and kept a secretary or two always employed. Since John Quincy Adams there has not been among us such an example of laborious, self-exacting, seemingly inexhaustible old age; and, unlike Adams, Mr. Bancroft kept his social side always fresh and active, and did not have, like the venerable ex-President, to force himself out in the evening in order "to learn the art of conversation." This combination, with his monumental literary work, will keep his memory secure. It will possibly outlive that of many men of greater inspiration, loftier aims, and sublimer qualities.

Mr. Bancroft, as an historian, combined some of the greatest merits and some of the profoundest defects ever united in a single author. His merits are obvious enough. He has great enthusiasm for his subject. He is profoundly imbued with that democratic spirit without which the history of the United States cannot be justly written. He has the graphic quality so wanting in Hildreth and the saliency whose absence makes Prescott too smooth. He has a style essentially picturesque, whatever may be its faults. The reader is compelled to admit that his resources in the way of preparation are inexhaustible, and that his command of them is astounding. One must follow him minutely, for instance, through the history of the war for independence, to appreciate in full the consummate grasp of a mind which can deploy military events in a narrative as a general deploys brigades in a field. Add to this the capacity for occasional maxims to the highest degree profound and lucid, in the way of political philosophy, and you certainly combine in one man some of the greatest qualities of the historian.

Against this are to be set very grave faults. In his earlier editions there was an habitual pomposity and inflation of style which the sterner taste of his later years has so modified that we must now condone it. The same heroic revision has cut off many tame and commonplace remarks as trite as those virtuous truisms by which second-rate actors bring down the applause of the galleries at cheap theatres. Many needless philosophical digressions have shared the same fate. But many faults remain. There is, in the first place, that error so common with the graphic school of historians—the exaggerated estimate of manuscript or fragmentary material at the expense of what is printed and permanent. In many departments of history this dependence is inevitable; but, unfortunately, Mr. Bancroft is not, except in the very earliest volumes of his history, dealing with such departments. The loose and mythical period of our history really ends with Capt. John Smith. From the moment when the Pilgrims landed, the main facts of American history are to be found recorded in a series of carefully prepared documents made by men to whom the pen was familiar, and who were exceedingly methodical in all their ways. The same is true of all the struggles which led to the Revolution, and of all those which followed. They were the work of honest-minded Anglo-Saxon men who, if they issued so much as a street hand-bill, said just what they meant and meant precisely what they said. To fill the gaps in this solid documentary chain is, no doubt, desirable—to fill it by every passing rumor, every suggestion of a French agent's busy brain; but to substitute this inferior matter for the firmer basis is wrong. Much of the graphic quality of Mr. Bancroft's writing is obtained by this means, and this portends, in certain directions, a future shrinkage and diminution in his fame.

But a fault far more serious than this is one which Mr. Bancroft shared with his historical contemporaries, but in which he far exceeded any of them—an utter ignoring of the very meaning and significance of a quotation-mark. Others of that day sinned. The long controversy between Jared Sparks and Lord Mahon grew out of this—the liberties taken by Sparks in editing Washington's letters. Prof. Edward T. Channing did the same thing in quoting the racy diaries of his grandfather, William Ellery, and substituting, for instance, in a passage cited as original, "We refreshed ourselves with meat and drink," for the far racier "We refreshed our Stomachs with Beefsteaks and Grogg." Hildreth in quoting from the 'Madison Papers,' did the same, for the sake not of propriety, but of convenience; even Frothingham made important omissions and variations, without indicating them, in quoting Hooke's remarkable sermon, "New England's Teares." But Bancroft is the chief of sinners in this respect; when he quotes a contemporary document or letter, it is absolutely impossible to tell, without careful verifying, whether what he gives us between the quotation-marks is precisely what should be there, or whether it is a compilation, rearrangement, selection, or even a series of mere paraphrases of his own. It would be easy to illustrate this abundantly, especially from the Stamp Act volume; but a single instance will suffice.

When in 1684 an English fleet sailed into Boston harbor, ostensibly on its way to attack the Dutch settlements on the Hudson, it left behind a royal commission, against whose mission of interference the colonial authorities at once protested, and they issued a paper, as one historian has said, "in words so clear and dignified as to give a foretaste of the Revolutionary state papers that were to follow a century later." If ever there was a document in our pre-Revolutionary history that ought to be quoted precisely as it was written, or not at all, it was this remonstrance. It thus begins in Bancroft's version, and the words have often been cited by others. He says of the colony of Massachusetts: "Preparing a remonstrance, not against deeds of tyranny, but the menace of tyranny, not against actual wrong, but against a principle of wrong, on the 25th of October, it thus addressed King Charles II." The alleged address is then given, apparently in full, and then follows the remark, "The spirit of the people corresponded with this address." It will hardly be believed that there never was any such address, and that no such document was ever in existence as that so formally cited here. Yet any one who will compare Bancroft's draft with the original in the Records of Massachusetts (volume iv., part 2, pages 168–9) will be instantly convinced of this. Bancroft has simply taken phrases and sentences here and there from a long document and rearranged, combined, and, in some cases, actually paraphrased them in his own way. Logically and rhetorically the work is his own. The colonial authorities adopted their own way of composition, and he adopted his. In some sentences we have Bancroft, not Endicott; the nineteenth century, not the seventeenth. Whether the transformation is an improvement or not is not the question; the thing cited is not the original. An accurate historian would no more have issued such a restatement under the shelter of quotation-marks than an accurate theologian would have rewritten the Ten Commandments and read his improved edition from the pulpit. And it is a curious fact that while Mr. Bancroft has amended so much else in his later editions, he has left this passage untouched, and still implies an adherence to the tradition that this is the way to write history.

And it is to be noted that the evil is doubled when this practice is combined with the other habit, already mentioned, of relying largely upon manuscript authorities. If an historian garbles, paraphrases, and rearranges when he is dealing with matter accessible to all, how much greater the peril when he is dealing with what is in written documents held under his own lock and key. It is not necessary to allege intentional perversion, but we are, at the very least, absolutely at the mercy of an inaccurate habit of mind. The importance of this point is directly manifested on opening the leaves of Mr. Bancroft's last and perhaps most valuable book, 'The History of the Constitution.' The most important part of this book consists, by concession of all, in the vast mass of selections from the private correspondence of the period; for instance, of M. Otto, the French Ambassador. We do not hesitate to say that, if tried by the standard of Mr. Bancroft's previous literary methods, this mass of correspondence, though valuable as suggestion, is worthless as authority. Until it has been carefully collated and compared with the originals we do not know that a paragraph or a sentence of it is left as the author wrote it; the system of paraphrase previously exhibited throws the shadow of doubt over all. No person can safely cite one of these letters in testimony; no person knows whether any particular statement contained in it comes to us in the words of its supposed author or of Mr. Bancroft. It is no answer to say that this loose method was the method of certain Greek historians; if Thucydides composed speeches for his heroes, it was at least known that he prepared them, and there was not the standing falsehood of a quotation-mark.

A drawback quite as serious is to be found in this, that Mr. Bancroft's extraordinary labors in old age were not usually devoted to revising the grounds of his own earlier judgments, but to perfecting his own style of expression and to

weaving in additional facts at those points which especially interested him. Prof. Agassiz used to say that the greatest labor of the student of biology came from the enormous difficulty of keeping up with current publications and the proceedings of societies; a man could carry on his own observations, but he could not venture to publish them without knowing all the latest statements made by other observers. Mr. Bancroft had to encounter the same obstacle in his historical work, and it must be owned that he sometimes ignored it. Absorbed in his own great stores of material, he often let the work of others go unobserved. It would be easy to multiply instances. Thus, the controversies about Verrazzano's explorations were conveniently settled by omitting his name altogether; there was no revision of the brief early statement that the Norse sagas were "mythological," certainly one of the least appropriate adjectives that could have been selected; Mr. Bancroft never even read—up to within a few years of his death, at any rate—the important monographs of Varnhagen in respect to Amerigo Vespucci; he did not keep up with the publications of the historical societies. Laboriously revising his whole history in 1876, and almost rewriting it for the edition of 1884, he allowed the labors of younger investigators to go on around him unobserved. The consequence is that much light has been let in upon American history in directions where he has not so much as a window; and there are points where his knowledge, vast as it is, will be found to have been already superseded. In this view that cannot be asserted of him which the late English historian, Mr. J. R. Green, proudly and justly claimed for himself: "I know what men will say of me—he died learning." But Mr. Bancroft at least died laboring, and in the harness.

Mr. Bancroft was twice married, first to Miss Sarah H. Dwight, who died June 26, 1837, and in the following year to Mrs. Elizabeth (Davis) Bliss. By the first marriage he had several children, of whom two only survive—John Chandler (Harv. Coll., 1854), now residing in Boston, and George (Harv. Coll., 1856), who has spent most of his life in Europe.

WITH BRADFORD AND HARVARD.

LONDON, December, 1890.

TRINITY COLLEGE in Cambridge holds the tithes, and a former Fellow of Trinity is the incumbent, of the joint parish of Bawtry and Austerfield in Yorkshire, where Lord Houghton, son of the late peer who was better known as Richard Monckton Milnes, is lord of the manor. His estate of Bawtry Hall lies just at the end of the little market square in Bawtry, exhibiting nothing, however, to the passer but its tufted trees behind a high brick wall; but within one finds a sloping sweep of lawn and diversifying water, open to the south, marking it as the estate of a well-conditioned landed proprietor. The present lord is hardly known to his people, being an invalid and an absentee, seeking his health in milder climes, and his estate is rented. Within his domain and neighboring to Bawtry are the little hamlets of Austerfield and Scrooby, so closely associated with the foundations of our New England Pilgrim history. At Scrooby almost every vestige is gone of the old manor-house in which Cardinal Woolsey lived at one time, and in which, during the occupancy of William Brewster, the lowly people of this region came stealthily to commune together and to counsel towards the forming of that little church of the Separatists which ultimately took the Pilgrim spirit to New England. A few old beams in an outbuilding are all that one can with confidence look upon as relics of that association of house and timid worshippers.

I stopped in Bawtry at the Crown Inn, and in sundry walks swept this hallowed region with my eye. The face of the country very likely has changed little. It is not far from level, and there still run the very by-paths across the fields by which Bradford walked from his home in Austerfield to Brewster's house in Scrooby; or at least gate, and stile, and trodden sod indicate passages that might have been made nearly three hundred years ago, preserving the neighborly rights of way which are so stubbornly supported in this country. I walked out to Austerfield on Sunday afternoon by the old highway which connects it with Bawtry and with Scrooby beyond. The little hamlet is built along a narrow road. The houses are of brick, as humble in appearance as its people are poor in substance. They told me there had not been a building built in it almost within the memory of man, except perhaps a chapel of "Primitive Methodists," where the passer heard the worshippers singing hymns. You see none of the vigor of early manhood in the people. The children pass out of the school to migrate and seek to develop in more promising regions. A little Norman church, from which the late Lord Houghton sent a stone to be built into Robert Collyer's church at Chicago, lies at one end of the village, not far from the old brick house, just beyond, which is pointed out as the home of the Bradfords of those early days of the seventeenth century. I found the vicar had already preceded me from Bawtry to hold an afternoon service. The two bells in the little belfry were alternately tolling, and as we turned from the street into a lane which bordered a cow-yard, there was no token of human presence to be seen. The long uncut dun grass was matted among the gravestones in the yard surrounding the curious little church, which stood with the belfry end towards the approach, and was streaked with the patchwork in rough stone and in plaster of change after change in the centuries since the cunning workmen groined the sightly Norman chancel arch. This arch at once attracts your attention when you enter by the rather striking little porch on the south side. The tiny building palpably shows each succeeding development of its architectural growth. Looking up the shallow chancel, we see a later Gothic window, with its apex cut off by a suspended ceiling of recenter construction. The organ-loft and seatings are of modern construction, and beneath the loft stands the old font of Bradford's day. A tablet on the wall records the fact that, some fifty years ago, additional seats were made in the little church. The vicar who holds a morning service at Bawtry, conducts another here in the afternoon with small encouragement. The sexton sat under the little reading-desk, and two women, an old man, and a child or two constituted, with my own party, the whole congregation. The vicar's wife sat at the organ, and a few children's voices in the loft joined in the anthem. The declining sun streamed upon the spot where Gov. Bradford was baptized, and the warm suffusion of the hour did something to dispel the cheerlessness of the surroundings.

The vicar showed to me at his house the registry of the church in the sixteenth century. The Bradfords, or Bradforths, were not infrequent names, before and later than the baptismal record of the future Governor of New Plymouth. I noticed the name of Button—that of one of the *Mayflower* company; but hardly another having any such familiar associations. It was but a few days later that news reached me of the death of Dr. Henry M. Dexter, who, in his pursuit of the traces of Pilgrim history, had spent so much time in more than one visit in examining this register, and drinking in the associations of a region so sacred to him as this. It is to be hoped that the ripe results of his long years' study of the formation and early progress of the church of Brewster and Bradford have culminated in a narrative which will not be kept much longer from the world. The vicar of Bawtry spoke of Dexter's eager inquiries in this region during six weeks which he spent at the Crown Inn in 1874. I have found traces of his protracted study in this field among the sixteenth and seventeenth-century tracts preserved in the Cathedral library at York and in the library of St. John's College at Cambridge.

From a pilgrimage at Austerfield and its neighborhood, I came to linger at the collegiate home of John Harvard. There is nothing in its architecture to connect him with the present condition of Emmanuel College, where Puritanism was long since banished, except one external wall of its oldest building, which is much the same in appearance as he must have known it, barring the manifest decay which threatens the whole structure. The Harvardian would gladly see in the main quadrangle of Emmanuel a duplicate of the statue of Harvard at the west end of our Memorial Hall; and one might indulge the hope that it will one day be seen there. They have his effigy in one of the stained windows of the refectory; but the figure is far from being of the same dignified and effective character with that of the statue. The colleges of Cambridge have each their distinctive boast, and the sponsorship of Harvard is most certainly that of Emmanuel. A connection with Harvard is of equal certainty a passport to the most kind hospitality of the master and fellows of the whilom Puritan College. They have nothing to exhibit as indicating the touch of his hand, except an account-book of Harvard's time, in which it seems to have been the custom of the undergraduates to debit items of expense. That the men made these entries rather than the bursar, seems perfectly clear from the variety and individual character of the hands in which, on the same page, the entries are made. There is one entry in this book under the name of John Harvard, and the signature I compared carefully with those in the registry of the University which Harvard signed when he took his bachelor's and master's degrees. The writing seemed to me identical in its distinctive peculiarities, and was quite different from that of the other entries in its neighborhood on the same page. It was interesting, when I stood by Dr. Luard in the Registry Office and looked at these signatures of Harvard, to see the men of to-day come in and sign just in the same way for the degrees which I saw conferred upon them the next day in the Senate House, when, kneeling before the Vice-Chancellor in his robes, and placing their hands in his, in an act of homage which had come down in observance from the feudal days, they listened to the complimentary honor given in language almost identical with that which President Eliot uses in Sanders Theatre on commencement days, and with the same old English pronunciation of Latin.

Dr. Phear, the Master of Emmanuel, may one day, if renewed health permits, allow Harvardians in America to testify their reverence for his College with the same emphasis which accompanied the reception of one of the Fellows of the College, Dr. Creighton, when he attended the jubilee in our Cambridge in 1886. The friends whom that gentleman made then will be glad to know with what satisfaction the Queen's recent action has been received here, when she transferred him from a canonry at Worcester to a stall in St. George's Chapel

in Windsor. One of the London weekly journals remarked upon this intelligence, that the pupil of Stubbs in historical studies has apparently begun to tread the same path that led that distinguished historian to the bishoprics of Chester and Oxford.

There are few readier and more engaging speakers in England than Prof. Creighton, and no one who shuns work less. I have heard him twice of late. The first time was when he lectured on the preparation in Europe for the Reformation, before an audience of the townspeople, in the Chapter-house at Worcester; and the eager attention of his hearers testified to his easy mastery of a somewhat difficult subject in presenting it to the common apprehension, without prejudice or cant. The second time I listened to him on the piratical spirit of commerce in Queen Elizabeth's time. It was in the dining-hall of Emmanuel, with John Harvard looking on from the painted windows, beside Mildmay, the founder of Emmanuel. As the dining-rooms of the colleges are only used for a late dinner, it often happens that lectures are given in them, when the tables are put to use for the taking of notes. It was so on this occasion. There were three tables running lengthwise of the hall, and the speaker, using a waiter's tray propped on a cross-legged stool for a rostrum, spoke from a few notes, and referred at intervals to the books beside him. The centre table and one at the side were occupied by undergraduates and other of their sex, while the other wall table was filled with ladies and with the young women from Newnham and Girton. After the lecture, the Professor took me to one of his hearers and pupils, a recent graduate of the Harvard Annex. She later spoke to me of the inspiring character of Creighton's talks in the class-room at Newnham, where his kindly yet searching questions forced his pupils to their best endeavors. She was also struck, she said, with the labors of Seeley and Prothero—the latter a reader in history at King's—among the Newnham girls; but was not, at the same time, unmindful, of the warm efforts by which the history-students of the Harvard Annex are so admirably nurtured under Prof. Hart in the "Annex."

"But what is your drawback here?" I asked. "It is the absence of the Harvard library. When will the English learn the value of a subject-catalogue?" This is certainly a vital question in the British library methods. The idea was an appalling one to English librarians, when I was here at the forming of their library association in 1877. I perceive a great change has taken place since then, and the idea of the help which a subject-catalogue affords has been certainly grasped to some extent, and, once seized upon, one may be sure it will never be surrendered. Yet in the conversations which I had with the librarian of the University at Cambridge, I found he was still clinging to the old feeling that special published bibliographies were enough. At the British Museum, however, the other day, I found Dr. Garnett, the Keeper of the Printed Books, quite prepared to say that if the Treasury, ten years hence, would give them the money, they would then have completed their author's catalogue in type and would be ready to begin a subject-index. The American libraries boast the subject-catalogue as their invention—at least in its full development—and it is not a little gratification to see what progress their ideas have made in England during the last fifteen years—particularly to have won to their support so influential an advocate as Richard Garnett, whose name is one with which I like to close this letter.

JUSTIN WINSOR.

THE GUELPH EXHIBITION.

LONDON, January 1, 1891.

WHEN, last year, reversing chronological order, the Tudors succeeded the Stuarts at the New Gallery on Regent Street, it was thought that with them interest in these winter historical exhibitions must cease. There remained for illustration but the House of Hanover; and of the princes of this royal family Englishmen, though grateful to them, have never been proud. The four Georges and the sailor King evoke no sentiment; they arouse no enthusiasm. Among them was no great sovereign like the Tudor Henry or Elizabeth, no gallant heroes like the descendants of the martyr Charles. They were useful to England, and their services, at best but of negative value, are their sole claim to respect or honor. It seemed impossible with such material to make a show that could worthily follow the two already held. And yet the Guelph Exhibition (the Committee probably hope that the old family name may cast a glamour of romance over the sadly mediocre rulers of the Dutch Versailles), opened this week, is, taking it as a whole, the most interesting the New Gallery has yet given us.

The reason for this is not far to seek. If Hanoverian princes themselves were insignificant, the century their five reigns cover is one of the most striking in English history. Never has England had greater statesmen; never, not even in Elizabeth's day, braver soldiers and sailors. English art in the latter half of the eighteenth and the beginning of the nineteenth century attained its most brilliant stage; English letters can boast of but few more glorious names than those on the long list that begins with Addison, Steele, and Pope, and ends with Byron, Shelley, and Coleridge. The English stage reached the zenith of its fame with its Garricks, and Keans, and Kembles. A new era was inaugurated in English science with Newton, Herschel, and Jenner. The period was great despite, and not because of, its kings, and the very insignificance of sovereigns gave additional prominence to distinguished subjects. In like manner, in the Guelph exhibition, kings and princes, who dominated the two other shows, hold but a secondary position. Interest now centres about the men and women whose genius and intellect made them the true rulers of the times.

The portraits are again the most important feature of the exhibition, and much space has been reserved for them. They cover the walls in the three galleries and in the balcony upstairs. With few exceptions, all have been seen before; many have long since been made familiar by numerous reproductions; others are known by their replicas in the National Portrait Gallery. But they never have been thus brought together to illustrate one particular period, and herein exists the chief novelty of the present arrangement. They have been divided for convenience into portraits of royalty, portraits of statesmen and commanders, portraits of artists, literary men, actors, and scientists. As the exhibition is frankly historical, and only accidentally artistic, this is the best division that could have been suggested.

In the first gallery, royalties can at once be cheerfully disposed of. There they hang in all their mediocrity: the first George, in great flowing wig, to whom Sir Godfrey Kneller could not impart a spark of interest; the second, the profligate, whom even his vices could not redeem from commonplaceness on horseback and in all the glory of red military coat; the third, his well-meaning stupidity writ large on every feature, as on that of good Queen Charlotte, an amiable, motherly person, for all her enormous hoops and fine jewels; the fourth, the first gentleman of Europe, as his valet made him; and William, with a certain theatrical pretentiousness which was not his, but was lent him by the painter, Sir Thomas Lawrence. It is interesting to compare them with the manly, self-assertive Tudors who hung on these same walls last year. There is not a man, a real man, among these English Guelphs. Is it any wonder that court painters of the eighteenth century seemed paralyzed by their royal sitters? Not Sir Joshua nor Gainsborough could give virile character to Hanoverians, though he could fill their portraits with the loveliness of color and the perfection of drawing. And if either had painted with the almost brutal realism of a Holbein, what then? These were but royal nonentities who sat to them.

In the second gallery there is another tale to tell. It is filled with statesmen and commanders. Together hang Fox and Pitt—in one portrait Pitt appears as a charming boy with a pretty girlish face, his soft hair hanging about it, in red coat and white waistcoat and breeches, lying in a brown wood—Canning and Burke. Here are Vernon—a stiffly painted and worse colored portrait, Thicknesse thought, when he saw it in the studio of Gainsborough, whose landscapes, to us so conventional, he preferred to his portraits—and Nelson, to whom, as he commanded, Rigaud the painter has added the "much-needed" beauty, but who has not fared so well at the hands of Guzzardi, the latter having shown him in his old age with the one eloquent armless sleeve. And here, too, is Col. Arthur Wellesley, weak, sensuous, effeminate-looking in his younger days, if he was at all as Hoppner painted him when Colonel of the Thirty-third Foot, and not in the least like the Duke of Wellington, the elderly gentleman with strong face and firm mouth, who hangs just above. It may be to add to his glory that the Committee have placed quite near him a portrait of Napoleon, with that marvellous head and face of his making all others in the gallery seem weak by comparison. Neither a statesman nor a commander, though included among them, but interesting to some Americans, is William Penn's second son, Thomas, in a drab coat and wig; feudal lord over 25,000,000 acres, the catalogue proudly describes him, and perhaps it is this that has gained the right of admission for himself and Lady Juliana Penn, who surely have as little claim to the distinction as the indifferent painter of their hard, flat portraits.

But it is in the third room—the Poets' corner—that the chief interest of the exhibition is concentrated. In this large company of writers, artists, scientists, and actors the whole history of Georgian greatness is revealed. More than to her Pitts and Nelsons and Wellingtons England has owed to her Popes, Shelleys, and Byrons, her Johnsons, Sternes, and Scotts, to her Reynoldses, Gainsboroughs, and Romneys, her Newtons and Herschels. There is not space here even to mention all the portraits of importance in this third room—for all are important because of their associations, even when as paintings they are as uninteresting as Westall's Byron, which cannot, however, altogether conceal the poet's great beauty, or the Shelley painted by Miss Curran, or the Keats done after his death by Joseph Severn, and repeated in many miniatures, but without the value of Hilton's drawing, also here, which has been reproduced and published in Lord Houghton's

Life. Some, as the Gray from Pembroke College, or the Charles Lamb lent by Sir Charles Dilke, are sadly dingy and faded, with but little quality left either as portraits or paintings. But it is a fact worth noting that many of the most distinguished canvases in the exhibition are to be found in the art-and-letters group, and in this connection I shall have something to say about them.

Another very obvious classification of the portraits would separate them into those whose value is historical solely and those which possess artistic distinction as well. There is perhaps no one portrait of such preëminence as Holbein's Duke of Suffolk or Christina of Milan of last year's show; but a series that includes the work of Hogarth, Gainsborough, Reynolds, and Romney, even though their masterpieces may not be shown, cannot fail to be of enormous interest artistically. To the best in this series I can but briefly refer. In George I.'s day the court painter still came from abroad, and Sir Godfrey Kneller then held that post. As a rule, he painted mere dummies in courtier's dress, though occasionally, in rendering a voluptuous, not to say coarse, type, like the Baroness Kilmansegge, the elephant of George I.'s court, he had a certain success. But while on his canvases Addison, Steele, and Congreve, now exhibited once again, lose their individuality and are transformed into courtiers pure and simple, one of the best works of Kneller, also here, is the well-known Pope, in green gown and red cap, with character enough in the long thin face, the fine broad brow, the protruding eyes, and the sad, worn expression. For it, one would willingly exchange all the court painter's fine lords and ladies. In other London loan exhibitions Hogarth has often been better represented. His admirable portrait of his sister Anne, in Quaker-like cap and fichu, full of character, well modelled and good in tone, is an example of his work at its best. But it is his one portrait of note. A picture of the Mall, where royalty in those days condescended to walk, is attributed to him; it is interesting topographically and because of the historical record in the crowd in the foreground, but it lacks quality as a painting, and it is very doubtful whether Hogarth is really responsible for it. But little more can be said for the "Trial of the Governor of the Fleet," which, however, is a genuine Hogarth, having been presented by the artist to Sir Horace Walpole, who was loud in its praise—a fact more noteworthy than the picture.

The most important Sir Joshuas for the rendering of character, no less than for subject, are, without doubt, the portraits of Dr. Johnson—his head, free of wig, showing all its massive proportions, his hands appropriately raised as if in declamation—and of Goldsmith, the serious dignity of his face redeeming its comic if friendly homeliness. "Sir Joshua," says Leslie in his Life of the artist, "meant to paint the author of the 'Vicar of Wakefield' and of the 'Deserted Village,' and not the Goldy who was laughed at by Boswell and Hawkins and quizzed by Burke." These two portraits were sent to the Royal Academy of 1770, and there hung side by side. Near them now, originally exhibited ten years earlier, is the portrait, which every one knows, of Sterne, in gown and wig, sitting with his head supported by one hand while the other rests on his hip, the face full of humor and intellect. It is, however, in such portraits as the marvellous Mrs. Siddons as "Tragic Muse," with its fine pose and rich glowing golds and reds, sent to the Academy of 1784, and the portrait group of Jane, Duchess of Gordon, and her little boy, exquisite in composition, that the beauty of color and the grace of flowing line which Sir Joshua seems to have inherited from the Venetians, is most apparent. And to the loveliness of the first is added the charm of association; for it was in this picture that Sir Joshua signed his name in the gold border of the drapery, and then, when Mrs. Siddons discovered it, said to her, with that fine old courtesy which long since went out of fashion, "I could not lose the honor this opportunity afforded me of going down to posterity on the hem of your garment." Of the other notable Sir Joshuas, I must at least mention his Beckford, of 'Vathek' fame, with heavy, dreamy eyes and full red lips, and all the charm of color that Reynolds could give to old lace falling in a jabot over a dark coat, and to the golden glow in a brown background; his young Alexander, tenth Duke of Hamilton, and his no less youthful Canning, both with a little of that peculiar grace and elegance that gave picturesqueness to an earlier generation.

The Gainsboroughs which call for most attention are two or three sketches, brilliant and vigorous, the most delightful, perhaps, being one of the Duchess of Cumberland, the face worked out, but the hair and the dress and its laces and ruffles suggested with a few unerring touches, each of which marks the master. The completed portrait which also finds a place on the walls loses by comparison. It is in these sketches that Gainsborough was least hampered by traditional conventions and the whims of his sitters. Another is of James Quin, the comedian, and nothing could be better than the character expressed in the fat face, alight with humor, despite the heavy, gross cheeks and double chin, and nothing simpler than the means employed; the head alone has been sketched in. This portrait, lent by the Queen, usually hangs in one of the bedchambers in Buckingham Palace into which the tourist never penetrates, and is now publicly exhibited for the first time.

To Romney justice is scarcely done, though he is represented by three portraits of Lady Hamilton, the first he ever painted of the beauty he afterwards painted so often, when he found her a servant in Mrs. Harvey's house at Ickwell Bury, and two lovely studies of her bewitching, smiling face set in a halo, as it were, of fair brown hair. A curious contrast is his Cowper, in bright red cap, and his striking portrait of himself. This is a half-length, and the artist's father, an old man with gray hair, stands just behind him. The color is sombre, and from the dark background the strong, nervous, strangely handsome face of the artist looks out with an intensity that is fairly startling. There are also portraits of Kneller, courtly, of course; Reynolds, fine in color; Gainsborough, disappointingly characterless; Hoppner, with fine qualities; Morland, bottle and glass at his side, which each artist has painted of himself, thus giving his portrait a double value; but all are thrown into comparative shade by the haunting face of Romney.

Like the portraits, the other exhibits—and they are many—are either wholly historical or partly works of art. To the first category belong the manuscripts. The collection is really a very wonderful one, and has been selected with much care and skill. Again royalty is eclipsed in interest, though it is curious to find how much more readily the first Georges wrote in every language but English; and one does not look wholly with indifference on a letter from George IV. to Wellington offering him the command of the army, beginning "My dear Friend," and signed "Always with great truth, your sincere friend, G. R." But one lingers far longer and with greater pleasure over Addison's illegible correspondence, or Boswell's invitations to dinner at the Crown and Anchor in the Strand to meet Dr. Johnson; over Byron's letters to Hoppner from Ravenna announcing a flight to Switzerland, now the Guiccioli is menaced by a convent; and Shelley's explanations to Byron about Clare and Allegra. There are letters from Smollett and Richardson and Scott, from Sterne and Swift and Charles Lamb; receipts from Kneller and Hogarth, notes to Lady Hamilton from Romney, to Stodhart from Hoppner. The correspondence of Davy, Herschel, Jenner, and Newton has been borrowed from. Among some of the other interesting examples in the collection are a long appeal from Kitty Clive to Garrick after the stoppage of her salary, and a volume of the 'Proceeding in the House of Commons touching the Impeachment of Edward, late Earl of Clarendon,' belonging to Swift, in which in the margin he has written, "a silly, tedious Irony," and "a very foolish Preface, J. S." The manuscripts should have an exhibition to themselves. In such a large show, containing so much that at first sight is more striking, they are but too easily overlooked.

The "relics" also are chiefly historical in their interest. But the enormous success of the Stuart relics cannot be hoped for them. It is not easy to be moved to sentiment over odds and ends that once belonged to the Guelphs. Even the loves of George IV. and Mrs. Fitzherbert hardly suggest romance, and it is not exactly a sentimental pleasure that one takes in their wedding rings and in their "eyes" done by the miniature painter Cosway and set, one in a ring, another in a locket. The uniform worn by Wellington at Waterloo and a number of articles taken from the carriage of Napoleon have more value. But even these have not quite the attraction of Dr. Johnson's writing-desk, Byron's neckerchief, or netting done by the poet Cowper.

Of more artistic importance are the miniatures, of which there is an unusually fine collection; the snuff-boxes, bonbonnières, and patch-boxes in exquisite repoussé work, in lapis lazuli and mother-of-pearl, painted or enamelled, in fact, of every possible sort and description; the seals, beautiful and varied (for the Georgian was the era of seals), and the watches, the latter rivalling the miniatures in numbers and beauty. There are also fair specimens of Worcester, and Chelsea, and Wedgwood ware, and of Battersea enamels, which probably reached their greatest perfection in the latter half of the eighteenth century. But of these I have left myself no space to speak. Rarely before have the English Guelphs appeared to better advantage. The Exhibition serves as a forcible reminder that, however weak and insignificant Hanoverian princes themselves were, the Hanoverian period was great in statesmanship, literature, and art.

N. N.

MADAME DE WARENS.

PARIS, January 11, 1891.

M. FRANÇOIS MUGNIER, Councillor at the Court of Chambéry in Savoy, has used his leisure time in studying the history of Rousseau and of the friend of Rousseau, Mme. de Warens, so well known to all the readers of the famous 'Confessions.' You will recognize at once the lawyer and magistrate in the author

of this historical and critical work; it would be difficult to be more accurate and detailed in the facts—so inexperienced in the art of writing. The book can be praised for its exactitude; it has at times almost a discouraging dulness, and the author loses himself in a multitude of little facts which have an indirect relation to his subject, but which in themselves are without interest. As for the style, one can hardly qualify it; it is no style at all, it is commonplace and what we call *gris* (gray). The book will nevertheless remain a part of the *Literatur*, as the Germans say, of Rousseau.

The rôle played by Rousseau not only in the development of French literature, but also in the development of ideas which preceded and partly caused the French Revolution, is of such magnitude that whatever concerns him assumes some importance. It is not surprising if, in his 'Confessions,' Rousseau, though he spoke of himself with a terrible sincerity, altered many facts. M. Mugnier has been doing for him what a certain M. Biré is now doing for Victor Hugo; he has caught him not once, but a hundred times and more, in what Newman politely called an economy of truth.

Mme. de Warens, the friend and protector of Rousseau when Rousseau was young and unknown, was born at Vevey, on May 31, 1699; her name was Françoise Louise de la Tour. Her mother died a year after her birth; her father married again, uniting with the daughter of a French Protestant who had found a refuge in Switzerland. The child remained with two aunts; when she was not yet fourteen years old, in the spring of 1713, she was engaged to Sébastien Isaac de Loys, son of Jean Baptiste de Loys, Seigneur de Lavardin. The marriage took place in September. M. de Loys was, like many Swiss noblemen, an officer; he had served in the army of the Duke of Savoy, then under the King of Sweden. He was now captain in the service of Berne. He took the name of Warens from a small estate of his father. In 1724 M. and Mme. de Warens settled at Lausanne, and afterwards at Vevey. In 1726 Mme. de Warens left for Evian, on the Savoy shore of the Lake of Geneva, under pretext of taking the waters. King Victor Amadeus was with his little court at that place. Mme. de Warens asked for an audience, and begged for his protection, as she declared to him that she wished to abandon the Protestant religion and to become a Catholic. The King gave her an escort of four of his guards, and she was taken to Annecy, to the Convent of the Visitation, in order to receive a complete religious instruction. On leaving Vevey for Evian, she had taken with her her jewels, the silver, and the best part of the linen. She was twenty-seven years old when she made her flight.

The special protection given by Victor Amadeus II. and by the Bishop of Geneva (Rossillon de Bernex) gave great éclat to the conversion of Mme. de Warens. Victor Amadeus bestowed upon her a pension of 1,500 livres, and the Bishop of Maurienne added to it a pension of 200 livres. The Bishop of Geneva had hoped that the example set by her would be followed by many persons, especially ladies belonging to the first Swiss families; but the Government of Berne took strong measures. It confiscated the property of Mme. de Warens; her divorce from her husband was pronounced. She herself did not show any great religious enthusiasm; she had nothing in her of the saint; she made it her profession to make her house a rendezvous for converts, but she was willing to receive everybody; she was gay and childish, and really indifferent in matters of religion.

She had already been two years in Annecy when Rousseau arrived. If it had not been for this event, the name of Mme. de Warens would certainly never have been mentioned outside of the smallest Savoyard circle, and she would have been long ago forgotten. Jean Jacques was born in Geneva on June 28, 1712; he was therefore thirteen years younger than Mme. de Warens. He came to Annecy in 1728; she was twenty-nine years old, and he was a boy of sixteen. Jean Jacques has told us that his grandfather was a minister; this quality really belonged to his great-uncle; his grandfather was a watchmaker. He also makes a graceful picture of the double marriage of his father and of his uncle on the same day; his uncle was really married five years after his father. As for that father, he was a singular man: violent, quarrelsome, fond of novels; he left the watch-making trade and turned dancing-master. After some quarrel he was condemned to three months' imprisonment; he quitted Geneva and fled to Germany. Jean Jacques had no father left. At the age of ten he entered as an apprentice at an engraver's, and remained three years with him. His master was very brutal, and he left Geneva on the 14th of March, 1728, going to Annecy, where he was directed by a curate to Mme. de Warens. She sent him to Turin, where he changed his religion and was employed as a servant in several houses. We have in the 'Émile' the history of that time: "There was, thirty years ago, in an Italian town, a young man reduced to the greatest penury. He was born a Calvinist, but, finding himself without resources, in a foreign land, he changed his religion in order to get bread." The Abbé Gaime, who showed him some kindness, is the "Vicaire savoyard," and afterwards inspired in Rousseau some of the finest pages which he ever wrote.

Rousseau had preserved a lively recollection of the lady whom he had seen in Annecy, who had appeared to him young, handsome, smiling, when he expected to find a stern matron. He returned to her; she allowed him to call her "Maman," she called him "Petit." She resolved to prepare him for the priesthood, and he entered the seminary. He had no vocation, and he was sent back to Mme. de Warens. After a short sojourn in Lyons, he returned again to Annecy, but did not find his protectress, who had left for Paris with M. d'Aubonne and her intendant, Claude Anet. It would be tedious to relate all the movements of Mme. de Warens. She was always at war with her husband's family, always intriguing, always trying to improve her condition. Rousseau had, even more than she, an uneasy spirit, and we find him in July, 1733, having completed his twenty-first year, fighting with his own family and claiming a part of his father's estate, anxious as he was to repay to Mme. de Warens a part of the money which she continued to spend for him.

In the spring of 1733 Claude Anet attempted suicide, and on this occasion Jean Jacques discovered that this faithful servant of Mme. de Warens was, and had been for several years, her lover. As Claude Anet plays a great part in the 'Confessions,' we must tell exactly who he was. He was born at Montreux, on January 17, 1706; he was therefore six years older than Rousseau and seven years younger than Mme. de Warens. His family had always been in the service of her family. His uncle was gardener of M. de Warens. When Mme. de Warens fled from Vevey, he fled with her, and he changed his religion when she did. It may be inferred from this fact that he obeyed a great passion, and that his passion had been reciprocated even at the time when Mme. de Warens was still under her husband's roof. When Rousseau discovered the real nature of the tie between the person whom so far he had always called "Mamma" and Claude Anet, he aspired to become himself her lover. M. Mugnier doubts, and we doubt with him, if Mme. de Warens, before treating Jean Jacques as a man and a lover, prepared him for this great change with the solemnity of which Rousseau speaks in the 'Confessions'; but it is really difficult to reason on the actions of such extraordinary people as Mme. de Warens and Rousseau. If we believe Rousseau, Claude Anet had not been her first lover; he names two others—M. de Tavel and the pastor Perret. She had for years concealed her relations with young Anet, who was her servant, and apparently a most faithful and devoted one. As for Rousseau, as soon as Mme. de Warens had become his mistress, he confided his happiness to Claude Anet.

It is difficult to imagine a more shocking life than that led at this juncture at Mme. de Warens's house. Rousseau as well as "Maman" appear to have been hardly conscious of it. Claude Anet seems to have had the most natural feelings—the infidelity of Mme. de Warens was a great blow to him. He died on the 13th of March, 1734, of pleurisy. "Mme. de Warens," says M. Mugnier, "was cruelly smitten by this event. She lost a wise and devoted friend, whose economy and firmness almost assured her existence. She lost even more: her fatherland disappeared with him and for ever. With whom could she now, in her hours of sadness, talk of the Lake, of the years of her youth, of the old friends? The fantastic and morose Rousseau, even in the *fine black coat* of Claude, could not replace him." Mme. de Warens lost soon afterwards her protector, the old Bishop of Annecy, who allowed her a pension; the pension which she received from Turin was very irregularly paid, and she was constantly claiming the arrears. The account of the common life of Rousseau and of Mme. de Warens given by M. Mugnier is interesting; it completes and rectifies in some points the account given in the 'Confessions.' Rousseau is not blind to the weakness of his mistress; he tells us how, during a journey he made to Grenoble, she took a substitute in the person of another new consort, a young Vintzenried, "a great *fade blondin*, well made, with a flat face, a mind equally flat, speaking like a fine Leander, vain, ignorant, etc.; and, after having said that the "poor Mamma," wishing to attach him to her service, "employed all the means which she thought proper, not forgetting those on which she counted most," he adds, grandiloquently: "Oh! if souls delivered from their terrestrial chains still behold from the midst of the eternal light what goes on among mortals, forgive me, dear and respected shade, if I do not spare your faults more than my own."

Here you have the whole Rousseau: a singular mixture of meanness and loftiness. Could this medley of vices and of intellectual qualities which characterizes Rousseau be understood by Mme. de Warens? Vile as her conduct was, she was more of a lady than he was of a gentleman, and she probably had a not bad influence over him. Visitors continue to go, year after year, to Les Charmettes. Her life there is described in the minutest details in the book of M. Mugnier. He describes all the little agitations of her empty life after Rousseau left her. Her money troubles ended only with her existence; she died almost in poverty, and was buried July 30, 1762.

Correspondence.

WOMEN AT JOHNS HOPKINS.

To the Editor of The Nation:

Sir: In a minute adopted by the Board of Trustees of Johns Hopkins University on the 29th of October last, it was unanimously resolved that when the Medical School of the University shall be opened, "women whose previous training has been equivalent to the preliminary medical course prescribed for men shall be admitted to such school upon the same terms as may be prescribed for men." If the action of the Trustees had ended here, the pronounced friends of coeducation would have scored a triumph. As a matter of fact, they will have to discover in the policy of the Johns Hopkins Board what Mr. Herbert Spencer has discovered in his social groups, retrogression as well as progression. For the minute already quoted goes on to expressly declare that it shall be understood that "such preliminary training in all its parts shall be obtained in some other institution of learning devoted in whole or in part to the education of women, or by private tuition."

At first sight this clause of the minute (which on its adoption was published in the daily papers of Baltimore, and now appears in the annual report of the University for 1890) will probably appear to the impartial friends of the higher education of women as a wise and useful precaution on the part of the governors of the University. On closer examination it will be seen to partially neutralize the value of the preceding clause. The requirements for admission to the future medical school will be high. It is not stated at present in what degree and in what way they will differ from the entrance requirements of the other leading medical schools of the country; but much may be inferred from the fact that those who have advocated the admission of women to the medical department of a university hitherto severely closed to the sex, have based their claim to support and assistance on the ground of the *national* importance of a school which will be able to supply those advantages which women must now seek in the "great foreign schools of Vienna, Paris, and Switzerland." The "Preliminary Medical Course" of the University, organized in 1882, will lead directly to the subjects required for admission to the Medical School. It is safe to assume that the studies pursued in this course will not overlap or anticipate those prescribed for the medical course proper, and that the time and work of the intending medical student will be economized to the utmost degree consistent with his proper instruction. But of these advantages of economized time and carefully adapted preparation no woman living in Baltimore, or in any of those parts of the South and West of which Baltimore is the natural educational centre, will be at liberty to avail herself.

To urge that Philadelphia, where there is a woman's medical school fully able to meet the necessities of preparation, is only ninety miles away from Baltimore, or that this or that woman's college will organize the requisite preliminary courses in chemistry and biology, does not squarely meet the point. The fact remains that such superior or especial advantage as the chemical and biological departments of the Johns Hopkins University offer in the preparation of medical students, will not be within reach of one class of students, nor will Baltimore, under present conditions, be a practicable place of residence for them. This latter fact is the more to be regretted from a conservative point of view, inasmuch as the Johns Hopkins is situated in a city throughout which its students are scattered as lodgers and boarders, so that the presence of women students could not interfere with the habits of students united in a corporate mode of life, as has been urged with reference to some of the colleges where such a mode exists.

Entrance to any of the Johns Hopkins courses of study is not granted on easy terms, so that women who had obtained the instruction necessary for admission to the preliminary medical course might reasonably be considered "picked" women in a sense sufficient to furnish guarantee of their seriousness of purpose in entering this course. It is difficult to understand why women who are to be trained jointly with men in hospital wards, in clinics, and in medical lecture-rooms, should not two years earlier receive instruction in common with them in physical, chemical, and biological lecture-rooms and laboratories. It is not consistent with a true knowledge of the human mind to draw an arbitrary line of separation in work in which the two sexes are ultimately to be thrown together in the closest relationship as students. Where problems so delicate and serious as those to be discussed in the study of medicine in all its branches are to be faced by men and women together, it would seem only common logic to assume that a previous habit of joint investigation of some of the less difficult problems of organic and inorganic life would afford a highly desirable training, for both sexes, in that purely scientific attude of mind which is in itself the best safeguard against the dreaded evils of coeducation.

A. C. K.

Baltimore, January 13, 1891.

THE DIFFERENCE.

To the Editor of The Nation:

Sir: The letter of my life-long friend, Prof. Thayer, illustrates exactly the difference between the methods which we advocate. He believes in Indian reform through the existing Government machinery, and has for years devoted time and effort as well as money to bringing it about. I tell him, and not for the first time, that his sacrifices are in vain; that Indian or any other reform with the present machinery is impossible, and that all reformers, before they accomplish anything, will have to put their strength together to get the machinery changed, and can then resume their different roads.

No member of either the House or Senate can or will ever get such a bill as he wants passed, for many reasons. In the first place, such a member only represents a locality, and is one unit among nearly 400. As long as he works for some local or private interest, he will find support from members who want his help for *their* schemes. The moment he sets up as guardian of the national honor or interest in the protection of the weak and defenceless, he is regarded as a Don Quixote, and finds himself like a child in the hands of the Indian Ring. Ask anybody who has tried to pilot a bill of general interest, even where there was no opposition, through the committees and the two houses, what sort of work it is, and then what chance he would have against such a combination as stands between him and the Indians.

Suppose, however, that some member or combination of members should by superhuman effort get a bill passed, they would have no security whatever for the mode of administration, at once secret and irresponsible. Mr. Thayer refers to a bill which has been for some years sleeping in the Senate as a good bill, but defective because it leaves the Indian Bureau in existence. Exactly, and does he imagine that any bill could ever be passed which did not contain some similar expedient for neutralizing it in the administration? A popular idea has long been to put the Indians under the control of the army, the result of which, under our present system, would be only to corrupt the army.

The only way to get at any real result would be to put the Indians in direct charge of some department, War or Interior, and to hold the head of that department, ex-officio, personally and publicly responsible for their condition, to make him stand up in open Congress, state, under a fire of debate and cross-examination, which would be even hotter than that of the Indian Ring, what legislation he thought necessary, use all the weight of his national official position to get it passed, and then to hold him to constant and public responsibility for its administration. In carrying out this there would be ample opportunity for the member to whom Mr. Thayer appeals; but to ask such a member to run a tilt against the whole mass of both House and Senate is to consign him, as remarked, to the inevitable fate of Don Quixote against the windmill.

Boston, January 15, 1891.

THE JAMESTOWN CHURCH MYTH.

To the Editor of The Nation:

Sir: When a myth creeps into history, it cannot be expelled without resistance. In a pleasantly written article on the old mansions and sites of the lower James River, published in the January number of the *Century Magazine*, it is mentioned that the ruined tower at Jamestown is a part of the old church in which John Rolfe was married to Pocahontas. There is no truth in the declaration, although it has found a place in several respectable histories.

The following are the facts as to Jamestown churches: When Lord Delaware arrived in 1610, he found a log chapel, "ruined and unfrequented," which was repaired. In 1616 John Rolfe described the town as containing fifty persons. Before 1619 the people, at their own charge, had built a church of hewn timber, fifty feet in length and twenty in breadth, an edifice to be remembered as the place where, in July, 1619, the first legislative assembly in North America convened. The first brick edifice of any kind in Jamestown was erected about the year 1640, and after this there was a brick church, twenty-three by fifty-six feet in dimensions, the foundations of which Bishop Meade traced. The church whose tower is now seen was built between 1676 and 1684, long after the bones of John Rolfe had crumbled to dust. The old magazine at Jamestown, a picture of which appears in the *Century*, was built about the same time as the last church. In the manuscript records of the Council of Virginia preserved by the Virginia Historical Society, under date of March 11, 1672 (O. S.), there is complaint against the contractors, who had brought the bricks but had not begun the building of the fort. In time it was completed, and is thus described by Clayton, who had been rector of the church:

"Now they have built a silly sort of a fort, that is, a brick wall in the shape of a half-moon, at the beginning of the swamp, because the channel of the river lies very near to the shore, but it is the same as if a fort were built at Chelsea to secure London from being taken by shipping. Besides, ships passing up the river are secured from the guns of the Fort till they come directly against the Fort by rea-

son it stands in a vale. . . . There was, indeed, an old fort of earth in the town, being a sort of tetragone, with something like bastions, as I remember; they let it be demolished, *and built the new one*, which serves little better than a defence to shoot wild ducks or geese."

Will some of your correspondents give me the authority for the declaration so often made that Rolfe was married at Jamestown?

EDWARD D. NEILL.

MACALESTER COLLEGE, SAINT PAUL, MINN.

TALLEYRAND ANTICIPATED.

TO THE EDITOR OF THE NATION:

SIR: In Mr. Whitelaw Reid's introduction to the extracts from the memoirs of Talleyrand, he quotes the statement to the effect that "In our day it is not easy to deceive for a long time. There is some one who has more sense than Voltaire, more than Bonaparte, more than any Director, more than any minister, past, present, or to come."

Commenting on this, he writes: "Students of current American politics are accustomed to the phrase, 'Everybody is wiser than anybody.' It may interest some of them to note from the above that Talleyrand said so before the American politicians."

But before that clever analyst of human nature had jotted down the remarks above mentioned, one who used the scalpel with possibly still greater skill in laying bare the motives of human action, and who exhibited unsurpassed acuteness in formulating rules for a successful career in "the world" — La Rochefoucauld, in short—had, in his 394th maxim, written as follows: "On peut être plus fin qu'un autre, mais non pas plus fin que tous les autres." Whether the adorer of Mme. La Fayette was the first observer who reduced this truth to the compass of a brief remark, or whether it can be traced back still further, I know not, and will leave for some one else to point out.

WM. D. GAILLARD.

CHARLESTON, S. C., January 10, 1891.

THE MISPLACED *H*.

TO THE EDITOR OF THE NATION:

SIR: Within a few days I have received a dissertation presented to the University at Helsingfors, Finland, in April, 1890, by Uno Lindelöf, and entitled, 'Die Sprache des Rituals von Durham: ein Beitrag zur altenglischen Grammatik.' The author, a pupil of Zupitza, has made an analysis of the Ritual gloss with much the same care, apparently, that Zeuner bestowed on the Psalter. In treating of the letter *h* he furnishes additional testimony to the antiquity of the peculiar use to which attention was recently called by F. H. In his opinion the gloss belongs probably to the end of the tenth century. He says (p. 69):

"Anlautendes *h* ist vor Vocalen sicher einfacher Hauch. Dass es sehr schwach war, beweist der Umstand, dass es einigemal unorganisch vor Vocalen erscheint, so wie es in neuenglischen Dialekten und in der Sprache ungebildeter Engländer oft der Fall ist. Hierher gehören: *se halda* (anticum) 105.8; *sio hatt'ne* (vipera) 125.14, welches wohl zu *attor* gehört; und *gehude* (praestabat) 197.10. —Nicht nur vor Vocalen kommt ein unorganisches *h* vor; dasselbe lässt sich einigemal auch vor *r* belegen; die Aussprache des *h* in der Gruppe *hr* muss wohl auch sehr schwach gewesen sein; *gihresta* (requiescere) 124.11; *gihriord* (epulam) 116.17 u. *gihrordiga* (epulemur, Skeat's Coll.) 25.9; *halges gihrynes* (sacramenti) 7.9; ebenso vor *l*: *hlæt* 28.10.

"Anderseits kommt auch Schwund von einem etymologisch berechtigten *h* im Anlaut vor: a) vor Vocalen: *use* (tabernaculo) 65.8; *ellvar'* (infernorum) 59.10; b) vor *l*: *lafardscipes* 182.10; *gilytto* (consortia) 22.20 für *gihlytto* (belegt 95.17, etc.; geslytte 191.20 ist Schreibfehler)."

Other examples, drawn mainly from the Northumbrian Gospels, may be found collected by Hilmer ('Zur altnordhumbrischen Laut- und Flexionslehre,' p. 43-4).

Very truly yours, EDWARD M. BROWN.

UNIVERSITY OF CINCINNATI, January 14, 1891.

"ENGLISH AS SHE IS WROTE."

TO THE EDITOR OF THE NATION:

SIR: As you have recently published two gems of foreign English, I beg to offer you a third, which seems to me too valuable a treasure to be lost or wasted. It is a translation from Baron von Liebig, printed on the wine-list of a Munich hotel, to allure the temperate visitors from England and America:

"As a means of refreshment,
When the faculties are exhausted;
To animate and cheer up,
When tristful days are to be overcome;
To regulate an adjust,
When disproportions in the nourishment
And disturbances of the organism
Have taken place;
And as a defense
Against transitory molestations,
Called forth by disorganic nature;
It is then that WINE
Will not be surpassed
By any product of nature
Or of art."

E. R.

BOSTON, January 16, 1891.

Notes.

THE announcements of the Messrs. Putnam for the coming season include the following works: 'The Battle of Manassas,' a reply to Gen. Joseph E. Johnston, by Gen. Beauregard; the second volume of John Jay's Writings and Correspondence, by Prof. H. P. Johnston; 'Chapters on the Theory and History of Banking,' by Prof. Charles F. Dunbar of Harvard University; 'Principles of Social Economics,' by George Gunton; 'How We Went and What We Saw,' a journey in the Levant, by Charles McCormick Reeve; 'Pilgrims in Palestine,' a family journey described by Thomas Hodgkin; 'Winona, a Dakota Legend; and Other Poems,' by Capt. E. L. Huggins, U.S.A.; 'The Vikings in Western Christendom, A. D. 789-888,' by Charles F. Keary; and 'A Literary Manual of Foreign Quotations (Latin, Italian, French, and German),' by John Devoe Belton.

Col. T. A. Dodge follows up his 'Alexander,' in his series of great military leaders, with 'Hannibal,' which is now in the press of Houghton, Mifflin & Co., as is also the second volume of Mr. James Parton's 'Captains of Industry.' They have nearly ready 'Francis Wayland,' in the series of American Religious Leaders, by Prof. J. O. Murray of Princeton, and the 'Crystal Button,' a Bellamytish story by Chauncey Thomas.

Mr. Edwin Arnold's new poem, 'The Light of the World,' is set down for publication next month by Funk & Wagnalls.

Jameson's 'Story of the Rear Column of the Emin Pasha Relief Expedition' is to find an American publisher in the United States Book Co.

'Undesigned Coincidences in the Old and New Testaments,' by the Rev. John J. Blunt, will shortly be issued by Wilbur B. Ketcham, New York.

W. S. Gottsberger & Co. publish directly 'A Child's Romance,' by Pierre Loti, in an authorized translation by Mrs. Clara Bell.

Riehl's tale, 'Der Fluch der Schönheit,' has been edited for schools by Prof. Calvin Thomas of Michigan University, and is ready to be published by D. C. Heath & Co., Boston.

We recently had occasion to speak with praise of the first two volumes of the new 'Hand book of Athletic Sports,' edited by Ernest Bell for the Bohn Library (New York: Scribner & Welford). The third and last is now obtainable, and we need do no more than mention the branches treated in it, viz., boxing, wrestling, fencing, broad-sword, and single-stick. Under the last caption the shillalah is introduced, with examples of its riotous employment, its mode of use (the left fore-arm guarding the left side of the head), and the humors of the Irish fondness for this weapon.

Nearly twenty years ago Mr. Edward Powers, C. E., sent us his 'War and the Weather,' an attempt to prove that the bringing on of rain was measurably within human control by the use of artillery. Mr. Powers's experimental evidence was drawn, of course, from the history of warfare. His argument and his arrangement seemed to us very defective then, and a revised edition which he has just published at Delavan, Wis., will not yet commend itself to a reasoning mind. He has adopted at least one of the corrections we pointed out in 1871, and by so much, at least, we can say the new book is better than the old; but otherwise we should have to repeat our judgment.

Mrs. F. J. A. Darr's 'The Strange Friend of Tito Gil' (A. Lovell & Co.), from the Spanish of Pedro A. De Alarcón, is really that writer's 'The Friend of Death' (*El Amigo de la Muerte*), with the hero given a new name and other liberties taken with the original. The translator's knowledge of Spanish appears to be so good that her occasional blunders are probably due to carelessness. For the rest the little tale is a whimsical one, miles away from all likelihood even to a Spanish reader, and still further to the English. The statement volunteered by the publishers that this story has led all Alarcón's others "in popularity and sales" is grossly inaccurate.

No. 1 in the "Diplomatic Series" of Mr. Worthington C. Ford's 'Winnowings in American History,' takes up the first diplomatic question that confronted the newly framed government of the United States in 1790, namely, our relations with Spain, and particularly the question what reply was to be given to the request which Washington expected the British to make, for permission to cross our territory with an expeditionary corps directed against the Spanish forts on the lower Mississippi. The President asked the opinion of each member of his Cabinet on this point, and their replies are here published in full. The general opinion was, that the permission should not be granted, and yet that it would be unwise to refuse outright lest the British should go ahead anyhow, and the feeble Government be unable to resent the affront. From those weak beginnings to the time when we do not propose to allow British vessels to navigate the Pacific Ocean, how vast the change!

Mr. Cecil Charles's 'Honduras' (Rand, McNally & Co.) is an unpretentious account of personal experiences in mining camps and along the route across the country, together with considerable information about its mineral and agricultural resources.

Something of the air of a hymn-book or a pocket Bible has been given to a complete edition of Tennyson's Poems just issued by Macmillan & Co. Gilt edges, rounded corners, flexible, dark morocco covers imply what is precious and intimate, and the small type and the thin but not translucent paper insure the necessary compactness. Altogether one seldom sees a more attractive volume of poetry, and it may well serve as a model. A steel portrait accompanies it.

'Memorabilia' is almost the last word to be applied to the volume intended to commemorate the late George B. Cheever, D.D., and his wife Elizabeth Wetmore, which comes to us from John Wiley & Sons. Half the book, or nearly 340 pages, is devoted to a collection of Dr. Cheever's verse, which has nothing memorable about it. So Dr. Cheever's nominal biography of his wife is inexpressibly crude, diffuse, discursive, and would be no loss if it had never been written. The same may be said, with very few exceptions, of the mass of letters pitchforked in at the end, with such an utter disregard of chronology that generally no date is affixed, and sometimes the reply precedes the original missive. The contents are dreadfully commonplace, for the most part. Cheever was a college classmate of Longfellow, and there are two or three characteristic brief letters by the poet. In one of these he says truly of Dr. Cheever's portrait, as the reader may judge from the frontispiece: "It not only resembles you, but two other persons whom one may not be ashamed to resemble, namely, Dr. Channing and Mr. Ruskin. The same outline of face, the same expression." A climax of disappointment is afforded by the so-called "copious index," which is neither an index nor copious.

Dr. Augustus Jessopp has done a good service by reprinting, in the Bohn Library (New York: Scribner & Welford), 'The Lives of the Norths,' together with their biographer's autobiography, which Dr. Jessopp himself first gave to the light in 1887. All previous editions, together with this concerning Roger North himself, had become scarce, while the historic worth and the human interest of these lives are perennial. There are three steel portraits of Francis, Dudley, and Roger North, and an index, not very full except as regards proper names; the whole in three volumes having the familiar Bohn stamp.

'Macmillan's School Atlas' considerably exceeds in bulk and importance works of the corresponding class in this country, and would have to be still larger if a special set of maps of the several States were prepared for American pupils. We should rather be disposed to emphasize another use of it, namely, as a family atlas, since it is a cheap and handy medium between our school atlases and the larger folios. It is equipped with an index, too. The physical as well as the political side of geography is well looked after. The workmanship is that of John Bartholomew & Co., less elegant in engraving and less delicate in coloring than that of the great German establishments, but sufficiently clear. The atlas is neatly bound in red cloth.

The Interior Department issues from time to time a wall-map of the United States, and such a one was prepared last year, under the auspices of the Geological Survey and the special direction of Mr. Henry Gannett, by Mr. Harry King, chief draughtsman. It has been beautifully engraved by Julius Bien & Co. of this city. The scale is 1:2,500,000, or approximately 40 miles to the inch. The topography is indicated by contour lines in red, at 100, 500, 1,000, 1,500, 2,000, 3,000, etc., feet above sea level. The 100-foot line is the most interesting of all, and, on the east coast, the loop which it makes in Florida shows strikingly how small a part of the peninsula has even this modest elevation. On the Pacific Coast the same line hugs the shore, and the higher succeed rapidly. The railroad system of the United States is delineated on this map.

A late *Athenæum* contains the notice issued by the Controller of the University Press, Oxford, respecting the terms for furnishing photographic negatives and prints from MSS., printed books, etc., in the Bodleian Library. This is a great boon to scholars, book-illustrators, and lecturers with the lantern, and the example cannot fail to be imitated in all great libraries the world over. The prices cited are remarkably low, as seventy-five cents for a 10x8 negative taken at the Library, eight cents for a silver print, and twenty for a platinotype or a carbon print, with reductions according to quantity. As the *Athenæum* remarks, "if (say) six persons of similar tastes will join to form a syndicate, they can obtain most satisfactory results."

We have received the first number of the *Pedagogical Seminary*, "an international record of educational literature, institutions, and progress," edited by Dr. G. Stanley Hall, President of Clark University, at Worcester, Mass. There will be three numbers a year. The first article, following the salutatory exposition of the objects of the new magazine, is by the editor, and treats of Educational Reforms. The next is a timely one, by W. H. Burnham, on the New German School, or the burning question of the reform of the Gymnasium. Then follow *précis* of works illustrating the higher education in France, Germany, the rest of Europe, and North America; medical education, and intermediate and elementary education. Notes conclude the number, giving summary accounts of recent publications, addresses, news-letters, etc. It cannot be doubted that the *Seminary* fills a gap.

Prof. William James vigorously takes up the cudgels for the proposed shortening of the college course in the *Harvard Monthly* for January. He argues—justly, as we believe—that a three years' course would deter from idleness and indifference (and we will add prankishness) in the first year, and would "brace up all along the line." He also touches the marrow of the question when he says: "The distinction of passmen from honormen, of 'general-culture men' from specializers, is founded in the nature of things, and *must* be provided for in our academic arrangements. Let the higher degrees serve for the latter class; let the lower degrees serve for the former." *Per contra*, the minority report of the Harvard Faculty in opposition to the change is given in the *Crimson* of January 15.

In the New York *Teacher* for December last, Prof. Hugh S. Bird criticises Mr. Worthington C. Ford's recent letter to this journal on the subject of Colonial Education in Virginia, laying especial stress on what the College of William and Mary contributed towards it.

On January 24 the Massachusetts Historical Society will celebrate its hundredth anniversary in the Arlington Street Church, Boston, with an address by Mr. T. W. Higginson. Moreover, it will make this event the occasion of issuing a volume of letters written to or by its founder, Dr. Jeremy Belknap, edited by Mr. Charles C. Smith. This collection promises to possess uncommon interest, both because of the eminence of the correspondents and the light which is shed upon the social, religious, political, and literary history of New England during the last quarter of the eighteenth century.

An archæological survey of Egypt has been undertaken by the Egypt Exploration Fund; and Mr. George Fraser, a civil engineer, and Mr. Percy E. Newberry, a specially trained student and photographer, have already begun work in the southern part of the province of Minieh, Upper Egypt. The results of each year's work will be published in volumes uniform with the annual memoirs of the Fund. A special fund has been opened for this survey, and subscriptions to it from America may be sent to the Rev. W. C. Winslow, 525 Beacon Street, Boston.

In our notice last week of Mr. Reeves's admirable work on 'The Finding of Wineland the Good,' we ought to have stated that the American publishers are Macmillan & Co.

—In the extracts from his Memoirs published in the current *Century*, Talleyrand tells of the Maine Yankee who would have liked well enough to see Gen. Washington, but whose enthusiasm was evoked by the idea of seeing "Mr. Bingham, the man who they say is so rich." "Throughout the States," comments Talleyrand (as translated in the *Century*), "I met with similar love for money, and often as coarsely expressed." From the fame of the narrator this story is likely to become a universally known illustration of the sordidness of the Yankee character; but a Boston correspondent calls our attention to the fact that so strong an inference is hardly justified. To a Maine rustic in 1794-95, when Talleyrand was in this country, William Bingham was probably the richest man in the world—indeed, so far as his immediate knowledge went, the only man of great wealth; but he was also a local celebrity, and it was less the amount of his wealth than his use of it which made him such. In 1786, the year of Shays' rebellion, it was very difficult even for a State to raise money, and in that year Massachusetts established a "land lottery," 2,720 tickets being offered for sale (at £60), each warranted to draw a prize. The larger prizes were to consist of a township six miles square, the smaller of a lot one-half a mile square; the entire territory thus disposed of being situated between the Penobscot and St. Croix Rivers, and including a part of Mt. Desert Island, as recent purchasers of villa lots in that neighborhood are aware. In payment of tickets soldiers' claims and other forms of depreciated currency were receivable, and most of them were sold, the remainder being taken by Bingham, who, after the distribution, bought up the greater part of the ticket-holders' titles. Bingham died in 1803, and at one time the Bingham heirs possessed the enormous amount of 2,350,000 acres in Maine, probably the largest estate which ever existed in the Eastern States. Bingham owned large tracts before the lottery, and in 1784 a town was named in his honor. Wealth spread over so large a territory as this might well excite the imagination even of men of wider knowledge and higher ideals than would naturally be found among a population of farmers and fishermen. Moreover, it was probably as a landowner, and not merely as a rich man, that Bingham made an impression on the Maine Yankee. The same thing holds good to-day. "In 1860," says our correspondent, "when camping out on the Union River, I heard much talk about the Binghams, but it was because they had lands. The same people never spoke of John Jacob Astor."

—The report of the proceedings of the second Congress of the Scotch-Irish Society of America is published by Robert Clarke & Co. of Cincinnati. The Congress was held last May at Pittsburgh, with much propriety, since in Western Pennsylvania above all other parts of the country the Scotch-Irish blood is predominant. It is asserted that at one time seven-eighths of the business men of that city were Scotch-Irish, and that three-fourths of the entire population are even now of that descent. This is not incredible if we accept the statement that, for several years prior to 1750, about twelve thousand of these people arrived annually in Pennsylvania. The Qua-

kers and the German immigrants had appropriated the eastern end of the State, and the new element was assigned to the pioneer work of the frontier—work for which they were peculiarly qualified by their experience in Ireland as well as by their natural vigor. From this region they spread toward the West and Southwest, occupying a large part of Ohio, filling the mountainous parts of the Southern States, and descending into the more level portions of Kentucky and Tennessee. In this whole section they have been the leading element, and have obtained corresponding honors in both Church and State. Hitherto devoted to the serious business of life, they now pause to review their acquisitions, and, making due allowance for the glorification customary under such circumstances, we must yet admit that the greatness of their work well deserves commemoration.

—Of the papers read at this Congress, which was as successful as numbers, enthusiasm, and a good deal of eloquence could make it, that by Prof. Perry of Williams College upon the Scotch-Irish in New England is altogether the most valuable. He sketches the history of the three principal colonies, which were established at Worcester, at Londonderry, and in the Kennebec country, with considerable detail and in a very interesting manner. His researches will make the labor of establishing the somewhat neglected genealogies of these people much easier, and it is to work of this kind that the members of the newly formed society will naturally devote themselves. The paper on the Preston family, by Mr. W. E. Robinson of Brooklyn, deserves notice as showing what can be done in this direction. From that upon Gov. Houston of Texas we feel impelled by recent occurrences to quote a few sentences which were uttered by that eminent man in the United States Senate many years ago:

"I care not," he said, "what dreamers, and politicians, and travellers, and writers say to the contrary, I know the Indian character, and I confidently avow that if one-third of the many millions of dollars our Government has appropriated within the last twenty-five years, for the benefit of the Indian population, had been honestly and judiciously applied, there would not have been at this time a single tribe within the limits of our States and Territories but what would have been in the complete enjoyment of all the arts and all the comforts of civilized life. But there is not a tribe but has been outraged and defrauded; and nearly all the wars we have prosecuted against the Indians have grown out of the bold fraud and the cruel injustice played off upon them by our Indian agents and their accomplices."

—Count Lyeff N. Tolstoi's country-place, Yasnaya Polyana, is situated in the district of Krapivna, Government of Tule. The chief place—the county town—is Krapivna, containing 2,730 inhabitants. On the 10th of last December, as we learn from a St. Petersburg journal, a local murder trial was to come before the session of the court held there, and the rumor spread abroad that Count Tolstoi was to appear in the character of defender of the accused. As the Count's attitude towards all courts of justice was well known—he denies their authority and pays heavy fines rather than serve as juror—there was great popular curiosity to see him on this occasion, when he was, apparently, acting against his publicly announced principles. As the Count and his daughters partly confirmed the rumor by arriving a couple of days before the trial, the court-room was packed to the very last nook on the window-sills, the Count and his daughters occupying seats in the second row. But the Count did not plead. He confined his breach of his own principles to providing an advocate for the murderers and to a diligent taking of notes during the proceedings. The case on trial was as follows: A peasant youth, aged seventeen years, remarkably strong, and consequently envied and disliked by the other lads of the village, had been invited by four of his comrades to take a walk, after a village dance last May. The next morning his body was found in a pond, showing wounds made by stones on the head and body. A noose round his neck showed that he had also been strangled, and a stone of sixty pounds weight had been tied to his body with ropes.

—The murderers confessed their crime, but maintained that it had not been committed with premeditation. This being the case, the public prosecutor confined his brief speech to the argument that the evidence of premeditation was furnished by the ropes, as people are not in the habit of walking about with ropes in their pockets. The advocate provided by Count Tolstoi made an eloquent and highly sophistical argument, warmly urging acquittal for all four. The jury, however, pronounced three of them guilty. The fourth, a special friend of the victim, had taken no active part in the murder, and he was acquitted. One of the guilty was sentenced, as a minor, to two and a half years' imprisonment. The other two are to be sent to one of the less distant tracts of Siberia. The motive for the murder seemed to be downright animal brutality, without special provocation. This case is rendered doubly interesting by the circumstance that Count Tolstoi has maintained in private conversation that, while a Russian peasant may commit murder or other crimes on the impulse of the moment, he never does so with premeditation, contrary to his own showing in his disagreeable drama, "The Power of Darkness." The inference is that he may now have become convinced that a sentiment of brotherhood exists between the criminal of all nations, and may be induced to revise his opinions.

SMITH'S NEW DICTIONARY OF CLASSICAL ANTIQUITIES.

A Dictionary of Greek and Roman Antiquities. Edited by William Smith, LL.D. Third edition, revised and enlarged. In two volumes. Vol. I. Boston: Little, Brown & Co.; London: John Murray. 1890.

THE editor of this book has been vouchsafed a happiness which it is not given to many scholars to enjoy. The first edition of the 'Dictionary of Antiquities' appeared in 1842; it was revised and enlarged in 1848, and now, after almost fifty years from its first appearance, Dr. Smith is permitted to reissue it in a shape which promises as long a life in the future as it has had in the past. In the vastness of its scope this dictionary has always stood alone in the English language, and even in a foreign tongue there has been in the present century no work, except Lübke's 'Reallexicon,' which, in a single volume, has covered the field of antiquities at once so widely and so sufficiently. Other books have treated special branches with greater particularity. In this the whole subject of antiquities is contained, private, political, legal, artistic, architectural, numismatic, religious, military, theatrical. Of course, the scholar will never be content with the mere statements of results, which, however fully recorded, are all that can be expected in a book of this general nature; he will always want to know the steps by which these results were obtained; for every doctrine set forth, he will not rest satisfied until he has seen the grounds on which it is founded. By him, the fuller and more particular handbooks, the monographs and studies upon which, indeed, the dictionary is based, will need to be consulted. Even he, however, will always begin his researches with some such work as this dictionary, and if he be English or American, this will be the book which he will use. But to the less advanced though earnest student, to the seeker for education in general, Dr. Smith has been and will be the best and almost the only guide through this great field.

It seems scarcely necessary to remark, in these columns, upon the great advance that has been made in the study of antiquities during the past forty years. Both in archæology and in literary subjects the activity has been most vigorous. Of inscriptions alone, the discovery and publication of a wealth of material has quite revolutionized several departments of knowledge. The systematic excavation and re-excavation of ancient sites, while throwing light upon all the different branches of architecture, have yielded many treasures that illustrate life in classical antiquity. Our ideas of the constitutional and legal history of Greece and Rome have been revised. The comparative method, applied not only to language, but also to culture and religion, has explained much that before seemed dark and arbitrary. As a result of all this, and with the ever-increasing special treatises and monographs, the books upon which scholars of fifty years ago used to pin their faith have become obsolete or been rewritten.

There has, therefore, been no lack of material for use in the revision of Dr. Smith's Dictionary, and, so far as we have observed, this material has generally been carefully and faithfully employed. In fact, this edition may be regarded to a great extent as a new work, and readers will not be surprised to hear that in size it far exceeds the earlier one. The present first volume contains 1,293 pages; there were but 1,053 in the former book, complete in one volume. It is true that in the first four letters of the alphabet the editor has been able to use the *Thesaurus* of Daremberg and Saglio (which, begun in 1877, has only reached the letter D); but there appears to be a corresponding growth further on. Thus, E now covers 123 pages, to 76 in the old edition; F, 77 to 48. To speak of single subjects in different branches of antiquities, we note that the article on *Domus* covers 32 pages, to 10 in the former work; *Eleusinia*, 10 to 3; *Exercitus*, 46 to 29; *Actio*, 9 to 4; *Fictile*, 14 to 3. In fact, we are told that one-third of the articles have been entirely rewritten, two-thirds greatly altered, about two hundred added, and hardly twenty reprinted as they stood before. There are also many more illustrations, this edition containing upwards of 450 new woodcuts. As in the former work, each article is signed with the initials of its writer, and a complete list of writers is given after the title-page. In the former there were eighteen, in the present list forty-four (besides those members of the old staff who still survive), all Englishmen or persons holding positions in schools or colleges in the United Kingdom.

It must be evident that, in a work of this vast extent, mistakes and imperfections will disclose themselves only gradually, with time and use. No one man lives who could pretend to criticise it at present except in general terms, with such particulars here and there as may meet his eye, or in the subjects in which he has special knowledge. That it should be without flaws were incredible. Dr. Smith himself, who might say with the sage—

γηράσκω δ' αἰεὶ πολλὰ διδασκόμενος,

would be the very last to set up the claim to perfection. We have stated that on the whole the work of its production has been faithfully performed. At the end of each article are given the sources upon which it is based, and to which scholars will turn for verification and further light. It is perhaps a result of the employment of different writers that the latest editions of standard hand-books are not always referred to. In such cases the doubt naturally arises whether the writer has given us the most approved information. Thus, the first edition of Marquardt is cited on page 4; the old edition of Schoemann on pages 10 and 41; and that of the 'Attische Process' on pages 123, 167, and 243—these all in spite of the fact that in the preface we are told that the old editions have been superseded. It is discouraging to find that the assistant editor, Mr. Wayte, is responsible for all but one of the above mentioned references. But those who are especially interested in legal antiquities need not be too greatly alarmed, for we have observed a number of references to Lipsius's edition of the 'Process,' and, further, the old paging is preserved on the margin of the new edition of that book. The legal articles, formerly written by Mr. George Long, have been either rewritten or improved, and are in general full and excellent. The word *ἀπαγωγή*, however, finds better treatment under *ἔνδειξις* than in its own place. The most obvious fault in the whole book is that the cuts are frequently very rude in their execution; the worst we have observed is that of the *danaces*, from which one could not possibly tell what this coin was like. The cuts of coins throughout the book must be a great disappointment to Dr. Percy Gardner, who wrote the *numismatica*. His name, though, is enough to show that no criticism of what is written on that subject is in place here. We may be permitted, without being invidious, to make a few special criticisms before closing our notice of this invaluable book.

Under *Cena* it is said that cases are found of Roman women reclining at table where there was conceived to be nothing bold or indelicate in their posture. But the very act of such reclining was to the Roman a most indelicate thing in a woman, and no instance of a respectable woman doing it will be found before the time of the Empire. Further, the cut produced in support of the statement is one of those funeral reliefs from which nothing can surely be determined about the actual practices of domestic life. The very nature of the scene forbids us to think that it could ever have been realized in the "good old times." Under *Chorus* there is not a hint that the writer of the article ever heard of the theory (many will now call it a doctrine) that there was no raised stage in the Greek theatre. He assumes that there was a stage, and says that the chorus "appear to have mounted it occasionally (*cf.* Soph. *O. C.* 856; Ar. *Av.* 353-400; Eur. *Helen.* 1627-40), if we are not merely to suppose that the chorus stood sufficiently close to the actors to be able to touch them." Now in not one of the passages cited is there any change of level expressed in the words of the play, and it is only by assuming that there was a stage to mount that obliges one to think that there was any mounting done at all. But more remarkable still is the notion that, if there was a stage, the actors upon it could be touched by the chorus in the orchestra, when Vitruvius, upon whom the whole theory of the Greek "stage" chiefly rests, says that it was from ten to twelve feet high! It is to be hoped that this matter will be less cavalierly dismissed under *Theatrum* in the second volume. Under *Domus* we find the old myth about the Greek house in Delos. There is no such house. Guhl and Koner, to whom reference is made in support of the statement, do indeed give a ground plan which they say is that of a house in Delos, and in their turn refer to the 'Antiquities of Ionia.' There the patient investigator will discover that the building was in Cnidos and was probably not a dwelling-house at all. Another favorite old myth crops up in the statement (on p. 687) that chimneys have been found in the ruins of ancient buildings. Where, except in baths and bakeries? We do not believe that any chimney has yet been discovered in an ancient dwelling-house, and the great mass of literary evidence is against the supposition that there were such conveniences. Nobody who knows the conservatism of the Romans will be willing to think that the existence of chimneys here and there in public buildings is sufficient evidence to prove that they were used in private houses. Under *Collegium* the *collegia opificum* are hardly mentioned, and the element of religion in all *collegia* is not brought out, nor the fact that many were little more than burial and benefit societies. Nor is it shown that the great body of *collegia* were an imitation of the important official ones, originally confined to the nobles, and that honor to the dead was frequently the object of these institutions. To conclude these observations, the article on the Eleusinian Mysteries, in the main satisfactory, might have been improved by consultation of Nebe's essay, to which no reference is made. The temple at Eleusis is too briefly described, and a plan should have been given of this structure, which was in some particulars unique. But this, perhaps, may be expected under *Templum*, for the first volume ends with *Juvenalia*.

AN EARLY AMERICAN ARTIST.

A Sketch of Chester Harding, Artist, Drawn by his own Hand. Edited by his Daughter, Margaret E. White. Boston: Houghton, Mifflin & Co. 1890.

CHESTER HARDING'S "Egotistography" has been long on the list of books "printed but not published." It is now, with some additions, given to the world by his daughter, and a very entertaining book it proves to be. Mr. Harding began his career at a period when art was at its lowest ebb in this country and life was at its narrowest, when the few good painters of the Revolutionary epoch were passing away, and there were few signs of a native art springing up in the place they had left vacant; and this sketch of his life affords us many a curious side-glance at the conditions of the time. He tells his story in a simple style, with a shrewdness, naïveté, and quiet humor that remind one of Franklin, though the humor would seem to be sometimes more unconscious than that of the great autobiographer.

He was born in Conway, Mass., in 1792, of a poor family who seem to have been a singular combination of shiftlessness with Yankee ingenuity, able to turn their hands to anything, yet always in debt, and always moving from place to place and trying new trades. His father "had a great inventive genius, and turned all his powers towards the discovery of perpetual motion." In this nomadic family was young Harding brought up, and it is not astonishing that he got barely enough schooling to enable him "to read the Bible." He inherited the family character, and in a few years was wood-cutter, chair-maker, soldier, drum-maker, peddler, tavern-keeper, house-painter, and, finally, sign-painter, and had lived in almost as many different places as he had trades. It is in this part of his story that one suspects some of his humor of being unconscious. When he gravely tells how he was swindled by a gambler who made him think, as usual, that he himself was doing the swindling; how he married and brought home a wife, and "had hardly reached it before he was sued for a small debt which he could not meet"; and how he left home at night to avoid his creditors, one wonders if he quite realizes the force of it all. It is only fair to say that the debts were afterwards paid in full. His military experience (in the war of 1812), from his own account, seems to have been confined to chicken-stealing and dysentery.

About 1819 or 1820 for dates are not plentiful in the book, while he was living as a sign-painter in Pittsburgh, he fell in with a "sign, ornamental, and portrait-painter" by the name of Nelson, whose productions seem to have been absolutely the first paintings he had ever seen. They filled him with admiration and delight, and he thought them "wonders of art." He determined to try if he could do the same thing, and, without any instruction whatever (for Nelson would not let him see him paint, or give him any hint as to how the thing was done), he set about it.

"I got a board, and, with such colors as I had for use in my trade, I began a portrait of my wife. I made a thing that looked like her. The moment I saw the likeness I became frantic with delight; it was like the discovery of a new sense; I could think of nothing else. From that time sign painting became odious and was much neglected."

He next painted a portrait of a journeyman baker for five dollars, and portraits of his landlord and landlady for twelve dollars each "on account." Thus began his professional career. In a short time he was "starring" the West, doing a profitable business in painting portraits, first at twenty-five and later at forty dollars a "head."

He must have had a strong natural ability for seizing a likeness: two months in the Academy at Philadelphia seems to have been all the regular study he had prior to his great success in Boston, yet his portraits seem to have given satisfaction. Some years later he was described in *Blackwood's Magazine* (August, 1824) as "ignorant of drawing." "Hence it is," continues his critic, "that his heads and bodies appear to be the work of two different persons, a master and a bungler." A good instance of this is the portrait of his wife, painted in 1821, which faces page 38, where the shoulders are all out of drawing and have nothing to do with the head. To the end he speaks of "painting heads" as his profession. He must have worked with astonishing rapidity. In one place in the book there is a record of his having painted fifteen portraits in three weeks, while he often gives the dates of beginning and finishing a portrait within two or three days of each other.

Of the early days there are one or two good stories, like that of his borrowing a dollar for the marketing, but being tempted too strongly and spending it to see his first play. "I do not remember," he says, "how we fared the next day in our marketing, *but I presume I borrowed another dollar in the morning.*" About this time also he read, or rather his wife read to him, his first novel, 'The Children of the Abbey.' He objected strongly at first, having been brought up to think "that cards and novels were the chief instruments of the devil in seducing mortals from the paths of virtue," but soon became so interested that he "kept her reading all night, and gave her no

rest until the novel was finished." "The first novel I ever read myself," he goes on, "was 'Rob Roy.' I could only read it understandingly by reading it aloud, and to this day I often find myself whispering the words in the daily newspaper." His disapproval of novels seems, however, to have been almost as persistent as his habit of reading aloud, for, as late as 1838, we find him writing to one of his children, "Novels only weaken the mind and give a distaste for useful reading."

After a year or two of portrait-painting in the West, he had laid by more than a thousand dollars and bought a carriage and horses, and with these he returned to his family, in western New York, in glory, and paid off the debts he had left behind him at the time of his moonlight flitting. He was "the wonder of the whole neighborhood," but the doubt with which the career of an artist was then looked upon is capitally shown by his account of an interview with his grandfather, who said gravely: "Chester, I want to speak to you about your present mode of life. I think it is very little better than swindling to charge $40 for one of those effigies. Now, I want you to give up this course of living and settle down on a farm and become *a respectable man.*"

He had now intended to go to Europe, but gave it up, temporarily, out of consideration for his wife and children, and instead, after short stays in other cities, went to Boston, where he met with great success, and "for six months rode triumphantly on the top wave of fortune." Boston was then, apparently, as much liable to "fads" as it is now, and what Gilbert Stuart called the "Harding fever" raged hotly. This self-made painter was the curiosity of the day, and had more work than he could do, while Stuart "was idle half the winter." To do Mr. Harding justice, he fully understood the nature of his success, and did not for a moment consider himself Stuart's equal—indeed, he afterwards called himself his pupil. He writes in his journal on the 27th of June, 1824: "There was something novel, perhaps, in my history that contributed more to my unheard-of success than any merit I possessed as a painter. The fact of a man's coming from the backwoods of America, entirely uneducated, to paint even a tolerable portrait, was enough to excite some little interest." The same reasons brought him much the same success in England, where he went in 1823, and where he was soon engaged upon portraits of royal dukes and other great men.

From this on, the book becomes less interesting. It relates the career of the ordinary successful portrait-painter, and loses the piquancy of the earlier chapters. There is, however, a naïf simplicity in the comments of his journal on a life so new to him as that of the English aristocracy and country gentry; and his criticisms on the works of art which he now saw for the first time, are sometimes amusing. It is, for instance, difficult to conceive, at this day, that any one can ever have found West's "Death on the Pale Horse" "awfully sublime"!

After three years in Europe, Harding returned to America and resumed his tours among the various cities of the Union. He was again in England in 1846. He painted nearly all the celebrities of his day, and the volume gives many interesting glimpses of Randolph, Webster, Calhoun, and other contemporary statesmen. One of the most interesting is of Chief-Justice Marshall playing at quoits, and "down on his knees, measuring the contested distance with a straw with as much earnestness as if it had been a point of law." Harding's prices seem very modest when compared with modern standards. At the time of his first great success in Boston he charged fifty dollars for a head, and after his return from London his price had only advanced to one hundred. The last portrait he painted was one of Gen. W. T. Sherman. He died on April 1, 1866.

We have little by which to judge of Mr. Harding's standing as an artist. He seems to have been an indefatigable worker and to have made steady improvement in his art. His portraits are widely scattered, and few of them seem to be accessible to New Yorkers. Judging from the few photogravures in the book, he appears to have attained to respectability, but nothing more. As a man, he must be thought to have been every way admirable and much beloved, and he so far overcame his early lack of education as to mingle, on terms of equality, with the greatest men of his time, and to make on them all the impression that he was, emphatically, a gentleman. His "Egotistography" will, we believe, always remain a work of great interest. The lack of an index is to be regretted.

RECENT PHILOSOPHY.

Introduction to Philosophy: An Inquiry after a Rational System of Scientific Principles in their Relation to Ultimate Reality. By George Trumbull Ladd, Professor of Philosophy in Yale University. Charles Scribner's Sons. 1890. 8vo, pp. 426.

Essays in Philosophy. By William Knight, Professor of Moral Philosophy and Political Economy in the University of St. Andrews. Boston: Houghton, Mifflin & Company. 1890. 12mo, pp. 367.

Le Libre Arbitre: Étude Philosophique. Par Ernest Naville. Paris: Fischbacher. 1890. Pp. 338.

PROFESSOR LADD shows most distinctly that it is the philosophy and example of Lotze which have moved him to mediate between science and theology. The method perhaps suits the transitional stage of thought in this country, but it can hardly serve any other purpose than to render more easy and gradual the passage to the scientific point of view; for we cannot forget that Lotze was, after all, in entire sympathy with the methods of science, and made his concessions to idealistic thought in a way that lends no clear or adequate support to popular theology, and only lingers where the last struggles are going on between the old and new phases of belief because his system was an attempt at peace-making when the claims of science could no longer be contested in the spirit of the last century. The significance of this fact requires no remarks. But it may be interesting to observe that the reason for the diminishing importance of pure metaphysics is an incident or a view in the system of Lotze which Prof. Ladd does not take into account at all, or slurs over.

He continues, therefore, to inculcate the consequences contingent upon theories of philosophy. It is true that changes in fundamental views of philosophy do affect theology and ethics, and such an influence might be deplored or prevented if philosophy were dependent upon them for its jurisdiction; but after submitting the settlement of all claims to the authority of philosophy, it is absurd to complain if the decision sets aside demands of dependencies. Theology must be either the master or servant of philosophy, if the relation of dependence between them is to be assumed at all. Besides, Prof. Ladd forgets that in making everything contingent upon the issue in philosophy, the student must suspend judgment until the primary question is settled. The "ultimate reality" for which he contends, even after it is obtained, does not close the dispute, as the very postulates of ethics and theology, in his own view of the case, are not satisfied by it.

The chapter on the relation between psychology and philosophy indicates most unmistakably the tendency of the day to distinguish very sharply between the science and the metaphysics of psychology. Every one knows what psychology has been in the past, and how rich and fruitful it has become in recent years under the inspiration and direction of strictly scientific methods. We are coming to see clearly, and Prof. Ladd admits the legitimacy of the distinction, that it is one thing to determine the relations of resemblance and dependence in mental phenomena, and quite another to determine the nature of the being, subject, cause, or ground of which they are phenomena. The consequences of this distinction have already been very great in removing all metaphysics from psychological problems, but Prof. Ladd appears entirely unconscious of the manner and extent to which this fact cuts up by the roots the "practical" importance so long claimed for psychology, as a system of real or semi-metaphysics. As to the stake which religion and theology have in the matter, we are not so sure that they have anything to do with theories of metaphysics. They are usually held most tenaciously by those who either do not know anything about philosophy, or despise it; and as soon as they are submitted to reason, allegiance begins to relax. It would seem, then, the safest thing to let philosophy alone, unless we are willing to abide by its judgment. The cultivation of the scientific spirit in psychology enables us to do this very thing, and all the world is leaving speculative questions to the few who have an interest in them for purposes not immediately connected with practical life.

We have no desire to be unjust to Prof. Ladd, and in fairness to him it should be said that his volume has great merits. It shows deep reflection, and in the chapter on "Philosophy of Religion," the longest in the book, there is much candid warning given to the religious mind about hostility to science. He boldly tells us that religion has to appear before the bar of reason and be tried there before dogmatizing about her high claims, and that "a revelation which should contradict the truths implicated in all knowledge is unthinkable." That is to say, wherever a conflict arises between philosophy and religion, the concession must be made by the latter. Hence the contradiction is clear when he quotes to condemn the scholastic maxim, "Philosophia est ancilla theologiæ," and on the next page remarks that "a true philosophy can never contravene or mar the true religion"—a statement which might be a truism if the two subjects had no more relation to each other than geology and geography. He also speaks of "the mysteries of faith" as if he had never heard of the illusions caused by confusing it with intellectual assent to propositions, and in some cases with a certitude of conviction not given by reason.

The characteristic merits and faults of the work are best seen in the chapter on the "Theory of Knowledge." We can notice only the method of treatment. This is much more adapted to those who already understand the problem than to those who are to be introduced to it. It presumes here, as almost everywhere, that the student understands Kant and German idealism, an achievement which, it

seems, most men have not yet accomplished after having gone far beyond the need of an "introduction." We have a right to expect from such a work that it should treat the subject in a way to explain the nature of the problem by the plainest analysis of its terms and conceptions, with such history of its bearings as would create an interest in pursuing its implications to the end. But there is only the most general outline. In other words, we have more of Prof. Ladd's conclusions than elementary exposition, which is not what such a volume should give if it is meant for the student, as the preface declares. Those conclusions also, unfortunately, are so abstruse that none can fully appreciate them until he has completed his studies, and his prize then would be largely the staple formulas of logic and metaphysics.

Prof. Knight's collection of essays is excellent. It is all that Prof. Ladd's volume is not. The essays are clear, exhibit good literary style, possess interest, and above all show a cultivation of social, æsthetic, and intellectual taste. The reader is made to see from the beginning to the end that his conceptions in the field of higher problems are capable of expression in concrete questions of art, society, and politics. Although the mental power desirable in the treatment of any subject is lacking, you are pleased with the free-and-easy discussion and often a human sympathy that one seeks in vain in the charnel-houses of scholastic thought. It is some index of the author's taste and tendencies that he dedicates his volume to James Russell Lowell, and the reader will not mistake the nature of the inspiration that gives rise to the life and interest of the essays. The first essay is the best illustration of this. It is entitled "Idealism and Experience." The latter term is perhaps ill-chosen, as it does not exactly express what the author intends by it, and yet it would be difficult to select any other that would be better qualified for the purpose. "Experience" suggests a theory of the origin of knowledge, and not a comprehensive philosophy, as the first of the two terms indicates. Prof. Knight means that they shall contrast with each other as "idealism" and "realism" in literature and art are contrasted. Hence he is not here employed about any deep metaphysical problems in which these terms figure very largely. The author proposes an humbler and more interesting task, which is to show us the reflex influence of certain comprehensive mental attitudes upon art, literature, life, and social institutions. Without discussing any technical questions as to the position of particular men or schools, a general knowledge of their main spirit is assumed, as polite literature has understood them, and the influence of this main idea traced where neither its origin nor its nature is suspected by the casual observer. This result of "idealism" and "empiricism" in philosophy is often beautifully illustrated by the author from both Greek and modern history. Plato is the type of "idealism," and Aristotle of "realism" or "empiricism" in Greek thought, Descartes of "idealism" and Locke of "empiricism" in modern times. A most interesting generalization is drawn from the invariable tendency to a free, lofty, and imaginative literature wherever "idealism" in philosophy prevails, and a purely calculating and utilitarian spirit wherever "realism" is the dominant influence.

The second essay, on the classification of the sciences, has less literary merit, as might be expected. In regard to that problem the author might have observed that several forms of classification are possible and legitimate according to the principle adopted. He does remark that it is more important to determine the principle of classification than the classification itself; but he should have seen that little or nothing is left to do after fixing the principle, as the sciences will fall into place of themselves, and that the difficulty lies in showing that there is only one principle upon which the result can be effected.

The essay on "Ethical Philosophy and Evolution" is the most interesting in the series. It does not always make so clear as could be wished either the distinction between the origin and the validity of moral ideas, or the limited importance attaching to questions like necessitarianism and its opposite. Prof. Knight seems to imply that determinism is a necessary corollary of evolution, an opinion with which we can hardly agree. This whole controversy needs recasting and an analysis which the author has not given and which he could not give in the limited space at his command. In regard to evolution he evidently feels the immense changes it is destined to achieve in morals, but we think he has mistaken the reason, which he rather implies than formulates. He does what he can to explain the true meaning and limitations of the doctrine, but he does not remark that it derives all its destructive power in ethics from the theological theory which it is supplanting. It was theology that risked everything on the issue of its origin.

Most readers will hurry to the essay on "Immortality." On this subject Prof. Knight is candid. He does not think immortality so assured or so defensible philosophically as it may be desirable to mankind. It is on this sensitive subject that the profoundest feelings of men are racked, and it requires much courage on the part of philosophy to speak out its mind, and much indifference to human suffering to offend the hopes by which man endeavors to reconcile himself to the inequalities of life. Prof. Knight is sympathetic with men's beliefs about the doctrine, but admits that the problem is beset with difficulties, and sums up his own feelings about it by saying that the true mental attitude is one of "tranquil hope and expectancy, tempered by cheerful acquiescence."

The longest essay in the volume is on "Personality and the Infinite." This is a crucial question for theology under monistic tendencies in philosophy. Prof. Knight deals here mostly in criticism of Matthew Arnold and David Strauss, although less for the purpose of defending any special theory than to indicate the inconsistencies of the former and the radicalism of the latter. There is a very good essay on "Eclecticism" and a very suggestive one on "Metempsychosis."

Naville's volume on the freedom of the will is one of several that have recently appeared in France on the same subject, and, like them, is a defence of that doctrine against the prevailing tendency to materialism. It is calm and philosophic; but we think both schools of thought exaggerate the importance of settling the question, and that for two reasons. First, if free will be proved, responsibility does not necessarily follow from it. Second, the proof of necessitarianism theoretically would not be followed by any material alteration in our method of rewarding men for their virtues and punishing them for their crimes. We might be a little more humanitarian in our treatment of criminals. This volume of Naville's has some new material and arguments drawn from the phenomena of hypnotism, but the problem of freedom is not analyzed as it must be before any solution of it is possible; hence the author betrays no consciousness of the limitations which can be imposed upon the usefulness of the doctrine of freedom.

RECENT MUSICAL LITERATURE.

Cherubini. By F. J. Crowest. Scribner & Welford.

Beethoven. By H. A. Rudall. Scribner & Welford.

Wagner's Life and Works. By Gustav Kobbé. G. Schirmer.

Music and Culture. By Karl Merz. Philadelphia: T. Presser.

THE excellent series of short biographies of famous composers included in the "Great Musicians" series, and formerly edited by Dr. F. Hueffer, has been increased by a 'Cherubini' and a 'Beethoven,' which bring the number up to twelve. The best of them is still the first, the editor's 'Wagner,' which is now in the third edition. By the death of Dr. Hueffer, England lost her ablest musical critic, whose last work was a meritorious translation of the Wagner-Liszt correspondence; and it was a sad coincidence that about the same time Italy lost her leading musical critic and champion of Wagner, Filippo Filippi. In fact, that Hueffer is no longer the editor of the "Great Musicians" series is painfully evident in the 'Chérubini,' by Mr. Crowest, a prolific compiler of ill-digested musical books. In the preface we suddenly come across this extraordinary sentence: "As a composer Cherubini does not rank with Bach, Mozart, Beethoven, or *the last of the Titans* of music—Mendelssohn." Now, if Dr. Hueffer had been alive, he would have said: "My dear Mr. Crowest, we really cannot allow such a remark to go to the printers in the year of grace 1890. Remember that even if England is still far from being a musical nation, English criticism has lately risen to a much higher and more enlightened level, and no longer subscribes to the insular notion that Handel and Mendelssohn are the two greatest of all composers, which has made England the laughing-stock of the musical world, and which I have tried so hard, in the columns of the *Times*, to eradicate." Very probably Dr. Hueffer would have refused altogether to have his name used as editor of such a clumsy, incoherent example of book-making as this 'Cherubini,' the author of which was evidently writing against space to make up the necessary hundred pages; for after describing Cherubini's career and activity in the opera, concert-hall, and church, he goes over the whole ground again in other words. The last chapter is devoted to stale anecdotes. There are, however, plenty of interesting points in this composer's life to enable a man of literary ability to write a readable little book; but he would be expected to take more pains to ascertain facts than does Mr. Crowest, who tells us on page 75 that to this day "Medea" is often performed in Vienna, "to the delight of the thoroughly musical public of that city," when, as a matter of fact, the last attempt to revive this work there was made about ten years ago. It was then so coldly received that only one performance was given, although Materna was in the cast.

A much better work is Mr. Rudall's 'Beethoven,' although it is simply a compilation and does not offer any new facts or critical points of view. Beethoven's studies under Haydn, his love affairs, his fondness for the country, his eccentric manners and domestic troubles, the progress and effect of his deafness, his operatic projects, the transient Rossini fever in Vienna, his way of conducting,

and all the other leading topics are briefly and clearly discussed, so that this little book may be commended to those who wish a bird's-eye view of Beethoven's life and activity and have not time for Thayer's three volumes or Mr. Grove's long and admirable article on Beethoven in his 'Dictionary of Music and Musicians.' Some æsthetic points are neatly touched upon, as on p. 131, where reference is made to "that class of critics with whom the word 'romanticism' was a term of reproach, and who forgot, like many of their successors, that the 'romanticism' of one generation is often the 'classicism' of the next."

Mr. Kobbé's 'Wagner' is not entirely a novelty, as the second volume has been in the market for several years and has passed through five editions. It contains critical and descriptive analyses of the Nibelung Trilogy, "Tristan," "Die Meister-inger," and "Parsifal," after the manner of Hans von Wolzogen's "Thematischer Leitfaden"; the leading motives in each drama being named and illustrated in musical type, so that opera-goers can memorize them and thus be enabled the more easily to follow the complicated thematic woof of Wagner's orchestral scores, and understand the subtle psychologic and dramatic relations between these typical themes. The first volume, which is new in book form, contains a biography in ninety-four pages of Wagner, based chiefly on the composer's letters to Liszt and others, and his own autobiographic sketch, the interesting points being singled out with the acuteness of an experienced journalist who knows what the general public likes to read about. Then follows an entertaining account of the "Parsifal" festival at Bayreuth in 1882, together with a reprint of an article which appeared in *Scribner's* describing the mechanism of the scenic effects in Wagner's music-dramas, with illustrations. Wagner's writings and his critics also have chapters devoted to them, and the last thirty-eight pages are occupied with a brief description of the early operas down to "Lohengrin." Although Mr. Kobbé is an enthusiastic admirer of Wagner, he is not blind to the humorous aspect of some phases of the more than thirty years' Wagner war, and his first volume will be found as entertaining as the second is useful.

'Music and Culture' is a volume of essays by the late Karl Merz, collected by his son. It includes papers on purely musical topics, such as Expression, Church Music, Hints to Pupils, Harmony, Woman in Music, Value of a Musical Education, and others of a more general æsthetic cast—on Genius, Schopenhauer's Musical Philosophy, Music of Nature, Imagination, etc. The preface tells us that Karl Merz was "far too profound not to have fully outgrown such mental perversions as religious skepticism." No doubt he was profoundly religious, and some of his essays read very much like sermons; but of profundity as a musical thinker it would not be fair to accuse him. The tone of his writings is often sophomoric and always didactic, but they lack definiteness and that epigrammatic terseness which makes a maxim in one or two lines express more than a ten-page essay. Mr. Merz was an industrious Western teacher and editor who had to adapt his mental pabulum to the comprehension of a community in a somewhat primitive stage of æsthetic development. This makes his writings seem naïve to cultivated amateurs; but to the general musico-literary appetite they afford excellent nourishment, and Mr. Merz's influence can never be otherwise than wholesome. The only error of fact we have noted is on page 165, where he states that "Schumann loved once only."

TWO SPANISH NOVELS.

Una Cristiana. Por Emilia Pardo Bazán. Madrid: La España Editorial. 1890.

La Prueba: Segunda Parte de Una Cristiana. Por Emilia Pardo Bazán. Same Publishers. 1890.

THE plodding mind of the reviewer is sometimes set wondering at the amazing fecundity, combined with such good quality, of contemporary Spanish novelists, and catches at any explanation of it not too full of self-mortification. Accordingly it is with a comfortable sense of relief that he lays down these latest volumes of Señora Bazán, saying to himself that they are but her serious essays on the education and ideals of Spanish women turned into novels. It is true that this crumb of comfort soon wastes away almost to the vanishing point, as one considers the difficulties of this kind of literary transmutation, and recalls the essays that simply would not turn into novels, desperately as their authors tried to make them. The slow-going intellect is not long in discovering, either, that it has in these books a picture of many more aspects of life than can be squeezed into an essay, and that if the two have any relation, it is the latter that is partial and derivative. So about all that is left of the first feeling of consolation for a consciousness of inferiority is the fact that the books undoubtedly were written to exemplify actual types of Spanish women.

The story is one of much originality. Salustio, a student in the School of Engineering, has his expenses paid by a middle-aged bachelor uncle, for whom he nevertheless has a pronounced dislike. Uncle Felipe one day announces his approaching marriage with a young woman of their province, and the nephew is duly invited to the wedding, spending some days before the actual ceremony at the house of the bride's father, after the manner of rural hospitality. He finds his future aunt to be a girl whose delicacy of nature and pervading charm make it hard for him to understand how she could bring herself to marry his uncle, who is a coarse piece of clay. The mystery deepens as he comes to know her better, and finally he learns the secret by means of a discreditable bit of eavesdropping. This quiet and gracious girl is acting from a high and stern sense of duty. She cannot stay longer in her father's house without acquiescing in a wicked and scandalous course of life on his part; she has no friend to go to, and determines to marry the first man that offers himself, so as to clear herself from all complicity with her father's sin.

The marriage over, uncle and aunt set up their establishment in Madrid, and the student-nephew makes his home with them. Carmen soon finds that she had not counted the cost of living as a wife with a man whom she did not love and could not honor. More than that, she finds in the nephew one whom she might have loved, one who makes it clear to her that he loves her. Her course is a troubled one, but over it all she sails by the pole-star of duty. She is a model of wifely behavior. She shines before Salustio with such purity of thought and deed, even though she has not been able to conceal from him that she has to fight against her rebellious affection for him, that his passion is kept in check, her honor is sacred to him, and he reveres as much as he loves this "Christian."

"The Trial" comes on apace. Felipe is a man wholly absorbed in grossness of one kind and another, yet Carmen feels it her duty to love him, and struggles pitiably to do that impossible thing. She comes to believe that she shall have no safeguard against the standing temptation of Salustio's presence, unless she can drive herself into loving her husband. All is in vain, however, until at last Felipe begins to lose his health, and finally it appears that he is smitten with leprosy. Then the saintly woman of the Middle Ages comes to the surface in Carmen. She is like another Santa Teresa. She is prodigal and passionate in her devotion to the victim of the loathsome disease. She is carried out of herself. Salustio perceives with horror that his hold on her is loosening, that she withstands his bolder assaults with serenity, and that she really has something very like love—she declares that it is love—for the sickening and helpless mass, her husband. The query remains whether it all could have been anything more than the fevered altruism which used to lead devout Spanish women to bestow loving epithets and actual caresses upon the most repulsive inmates of lazarettos. Anyhow, the strain is not kept up too long, for Felipe dies, and the reader is left to infer that, after a proper period of mourning, Carmen will marry a man whom she can love without putting so much religious ecstasy into the affair.

She is the central character of the story—a sort of survival of an ancient Spanish type of woman. In modern days, Señora Bazán gives us to understand, the original devoutness has degenerated into the bigoted superstition of Salustio's mother, whose idea of God, as her son told her, was that "He had nothing to do but to run about with a cudgel beating her enemies"; and the old sense of duty has to do service only in matters of dress and etiquette, as in the case of the Barrientos young ladies. These last are the representatives of "the insipid class, nervous yet flabby, whose uselessness and intolerable silliness are the combined fruit of a stupefying way of life, defective education, narrow views, and frivolity." Upon them the novelist pours out all her indignant scorn, almost typical of the present generation of Spanish girls though she admits them to be, and overrun with lovers. "Out of their four little heads all together," she makes one of her really intelligent and progressive young men say—"out of them all you could not get enough to make a brain fry." And he adds, "It's enough to give one the shivers to think that future wives and mothers are being brought up like that; that those dolls stuffed with sawdust, all but their heads, which are empty, will be in due time the basis of a home, companions of intelligent men who may have gone through bitter struggles in life, and have come out with trained minds and developed ideas! Why, the fact is, young fellow, that a man who had as much as half his wits, and who was tied to one of them, would be giving her poison in two months' time!"

We have given but hints of the range and art of Señora Bazán's latest production. Her many-sided genius cannot but win new admiration in these pictures of life in the capital and in the provinces, these sympathetic descriptions of the lives of students enmeshed in the red tape and defective methods of Spanish education, these lively accounts of small politics and smaller journalism in Spain. One of the most delicious bits is the chapter given to the family of an English Protestant missionary. Without a suspicion of caricature, with photographic realism, in fact, the goodness, the fanaticism, the blundering, the fatal lack of appreciation of the Spanish nature, and the utter hopelessness of the task of those worthy Britons, are set forth in the most illuminating and convincing manner. That chapter ought to appear in all the missionary journals; but,

alas! they will give place only to the letters of the good missionary himself, describing the impending conversion of all Spain to the faith he preaches.

Studies in Jocular Literature: A Popular Subject more Closely Considered. By W. Carew Hazlitt. [The Book-Lover's Library.] New York: A. C. Armstrong & Son. 1890.

Mr. Hazlitt discourses pleasantly in this volume upon the history of jocular stories, and rambles over the whole literary ground, from the Greek Anthology and the anecdote-collectors of the later Greeks to the early Tudor jest-books and the witticisms of Sydney Smith and Lamb. It is not a collection of good things, however, that he gives us; in fact, the reader is more often tantalized by a reference to a story than delighted by its quotation; what is cited is merely in the way of illustration, to show the course of development, to characterize the school, or to point some opinion of the author. It appears that wit is a thing in which the race has distinctly made progress, though slowly and with labor. Particularly in the last few centuries, the author thinks, there has been an intellectual gain; but he is obliged to own that many jokes still current are of remote antiquity. Of this survival of isolated bright sayings or comical incidents he gives sufficient examples, but most of the wit of the ancients is dead to us, though it is in print still. The illustrations of the acclimatization of stories are excellent, and there are interesting examples of variation in the telling even in the case of one so near us as Lamb. The literary form is said to be seldom the same as the viva-voce original, and in the department of pointed wit the author favors the view that it is not spontaneous, but calculated, and cites Chesterfield as an instance. The field is rather too large to be dealt with in so few pages, and at best the volume serves rather as a convenient and stimulating introduction to wider reading than as a substitute for it. We notice a suggestion that the 'Hundred Merry Tales' are the work of Sir Thomas More, but the author inclines to credit them to the dramatist Heywood, on the ground that there are resemblances between them and some passages in his 'Interludes'; and it is observed besides that Heywood is reported to have derived something from More. The whole of this is mere guesswork.

We recommend the volume cordially to those who take an interest in this curious branch of literature, with the warning that the principal impression made on us, and apparently on the author, is the smallness of the sum of living wit in these old books.

The Narrative of Capt. Coignet (Soldier of the Empire). 1776–1850. Translated by Mrs. M. Carey. T. Y. Crowell & Co.

Documents adding to the Napoleonic epopee must not be looked for in these annals of a soldier's career. The brave Captain Coignet was no crafty maker of posthumous memoirs. Education came to him late in life and in moderate amount. Had he known how to read and write when he joined the grand army, there is no doubt his courage and sense of duty would soon have raised him from the ranks of the anonymous. Instead, it was almost in spite of himself that he conquered the gilt epaulettes, which did not metamorphose their wearer. The Old Guard "grognard" remained unchanged, and it is precisely from the author's personality that the narrative of Capt. Coignet derives its charm. It is but a mere bird's-eye view of his campaigns that he has left us; yet this unsophisticated sketch pleases us more than a pretentious work, because we feel it to be replete with the true atmosphere of the epoch it deals with, and because the author has found the means to show us, more impressively perhaps than the trained historian would do, the causes of the greatness of that epoch. All the details—the references to the Emperor, whose profile appears here and there traced with almost artistic touches; the genial traits showing the brotherhood then existing between officers and soldiers; the careless avoidance of the dark side of war; the good-humored disposal of self—all these notes reveal forcibly the vim and enthusiasm of that generation of men, and the magnetism of the general who led them in his triumphant promenades through Europe. In the ninth and last note-book of Capt. Coignet, the curtain goes down on Waterloo. Here the author's powers of observation seem to have come to a standstill. In view of what has gone before, this is regrettable—so much more might have been chronicled by that devotee of the imperial régime during the days of the Restoration. But Capt. Coignet never pretended to be an observer where he did not play a rôle. So, like many contemporary heroes, he rested on his laurels, satisfied with his eventful career.

The illustrations of this volume, by M. Le Blaut, exemplify fairly the work of that conscientious school of artists who, in the case of historical subjects, may be trusted to produce correct composition and to avoid anachronism. Mrs. Carey's translation preserves very successfully the briskness of the narrator, but a lack of familiarity with French idioms, in frequent instances, tones down the crude *brio* of the original.

English Intercourse with Siam in the Seventeenth Century. By John Anderson, M.D. London: Kegan Paul, Trench, Trübner & Co. 1890.

Dr. Anderson's interest in the history of English intercourse with Siam was aroused during a sojourn in the country for the purpose of making a zoölogical collection for the Indian Museum in Calcutta. The immense significance in the world's history of the establishment of England's Indian empire—a significance that cannot be properly appreciated until her work there has become past history—gives the study of the origin of this empire a singular importance in the history of colonial expansion. In some degree this study deals not only indirectly but directly with the beginnings of English Indian dominion, for the province of Tenasserim in the British Burma of to-day was an important part of Siam in the seventeenth century.

The first European to visit the region was Nicolò di Conti, early in the fifteenth century. By the year 1600 Siam and Tenasserim had become familiar names to English merchants. The first trading-post was established at Patani on the east side of the Malayan peninsula. This is Dr. Anderson's point of departure. His narrative is based largely on manuscript sources in the India Office, and everywhere gives evidence of most careful and scholarly labor. The work ends with the breaking up of the trading-stations, which was a natural consequence of the Siamese revolution of 1688.

Upon their arrival at Patani, the English found the State "governed by a queen who was invariably elected from the same family, and always old and beyond child-bearing, so that there might be no inducement to marry." The reigning queen was "threescore yeeres of age, tall and full of Maiestie; in all the Indies we had seen few like her." This curious custom would perhaps seem less preposterous to subjects of the late Virgin Queen than to any other Europeans. The romantic career of the Siamese Prime Minister, Constant Phaulkon, forms an interesting background to several of Dr. Anderson's chapters. He was born in Cephalonia, but whether of Greek, Venetian, or Genoese extraction is unknown. Taken to England as a child, he early went to Siam as a cabin-boy, where he chose to remain employed as a factor. His fortune rapidly improving, he embarked upon a venture of his own, but three times suffered shipwreck. The last of these misfortunes put him in the way of helping an ambassador of the King of Siam, who had been wrecked in the same storm. The ambassador presented him to the royal Minister of Commerce, who, pleased with his bearing, made him chief merchant to the King. Upon the death of the Minister, Phaulkon, at the early age of thirty-three, was made Minister of Foreign Affairs, and put in charge of the finances. By the East India Company we find him styled "Grand Visier or Chief Minister of the King of Siam." He had been bred a Protestant, but in Siam he was converted to Catholicism by the Jesuit missionaries, and joined with them in urging the King to embrace Christianity.

The tolerant and philosophic attitude of the Buddhist ruler offers a suggestive contrast to that of the "Most Christian King," who was sending missionaries to convert him in the very year of the *dragonnades*. He expressed surprise that the French King should take "so strong an interest in an affair 'which seemed to belong to God, and which the Divine Being appears to have left entirely to our discretion'"; but he welcomed the missionaries and proposed to build them a magnificent church. The hostility with which the conservative element at court viewed the increasing influence of Christianity led to the revolution in which Phaulkon was almost the first victim. The mingled reverence and ruthlessness with which the royal family on this occasion were put out of the way is a curious illustration of the Oriental character. "These royal personages were first tied in sacks of the finest velvet, so that they might not be polluted with the touch of any vulgar hand, and then no ordinary 'instrument of mortality' compassed their deaths, as their lives were beaten out of them with great bars of the sweet-smelling eagle-wood, each sack with its mangled remains being then cast into the Menam."

In the latter years of this history, the eponymous hero and generous benefactor of Yale College plays a prominent but not very creditable part. But Elihu Yale is not the first patron saint to belie the poet's words about "the evil that men do." In one of the appendices Dr. Anderson has collected a great number of extracts from writers of the seventeenth and eighteenth centuries illustrating the universal popularity of mum beer, while another contains an account of the burning of a wizard at Bombay, in 1671, that is fairly gruesome in its unstudied realism.

NO. 1.
The Veto Power,
Its Origin, Development, and Function in the Government of the United States. (1789–1889.) By EDWARD CAMPBELL MASON, A.B., Instructor in Political Economy; edited by ALBERT BUSHNELL HART, Ph.D., Assistant Professor of History. 8vo, pp. 232. Price, by mail, postpaid, $1.00.

In this work Mr. Mason has, in an introductory chapter, traced the origin of the veto power in English and Colonial usage. He then analyzes the four hundred and thirty-three vetoes submitted between March 4, 1789, and March 4, 1889, and discusses them by classes. The appendices contain a full list of all the vetoes, with references to the Senate and House Journals; a tabulation of bills signed and vetoed by each President; a list of Confederate vetoes, for the first time printed; a comparison of State Consitutional provisions as to the veto, and a bibliography.

NO. 2.
Introduction to the Study of Federal Government.
By ALBERT BUSHNELL HART, Ph.D. Assistant Professor of History. 8vo, pp. 200. Price, by mail, postpaid, $1.00, net.

This number is intended to be a guide to the comparative study of federal institutions, and especially illustrates the federal system of the United States. An introductory chapter discusses the theory of federal government; the history of federations, from the Greek leagues down to the overthrow of the Swiss Confederation in 1798 is then briefly taken up. The most important chapter is an account of the development of the four great federations of the United States, Switzerland, Germany, and Canada; a final chapter takes up Latin-American federations. Elaborate bibliographical notes are added. In an appendix the texts of the Constitutions of Canada, Germany, Switzerland, and the United States are shown in a classified and parallel form. There is also an appendix containing a bibliography of federal government in general.

G. P. Putnam's Sons,
27 and 29 West 23d St., N. Y.,
PUBLISH THIS WEEK:
The Second Volume of
The Writings and Correspondence OF JOHN JAY, first Chief Justice of the United States. Edited by HENRY P. JOHNSTON, Professor of American History in the College of the City of New York. The set is to be complete in four volumes octavo, uniform in size and style to the editions already issued of the writings of "Hamilton," "Franklin," and "Washington." The edition is like these, printed from type, and is limited to 750 copies. The remaining volumes will follow at intervals of about two months. Price, per volume, $5.00.

This set is distinctive in one respect from the sets previously issued of the writings of the "Fathers of the Republic." The editor has found it desirable to include in it, in addition to the letters, journals, and decisions of Jay himself, a selection of the more important of the letters from his correspondents, and the work makes therefore a very interesting presentation of the noteworthy events and of the questions under discussion during the revolutionary period and during the first years of the Republic. A large portion of the material included in it is also now for the first time published, and the set will therefore form a contribution of first importance for the history of the country and for that of the city and State of New York.

The Nation.

NEW YORK, THURSDAY, JANUARY 29, 1891.

The Week.

THE Force Bill was again shelved in the Senate on Monday, through the passage of a resolution to take up the Apportionment Bill in place of the proposed rule introducing the closure, which rule was brought forward solely and avowedly as a device to secure favorable action upon the Force Bill. Six Republican Senators voted with the Democrats, namely, Cameron of Pennsylvania, Washburn of Minnesota, Teller and Wolcott of Colorado, and Stewart and Jones of Nevada); a seventh (Ingalls of Kansas) was paired on the same side; and an eighth (Stanford of California), who was absent in this city and unpaired, announces that he would have voted with the Democrats if present. In other words, if all of the 88 Senators had been present, 45 would have voted in favor of shelving the Force Bill and 43 for continuing the fight to pass it, even at the expense of overthrowing all the rules and traditions of the Senate for a century. The result is accepted by all good judges in Washington as the final defeat of the Force Bill. The only way in which it could ever get before the Senate again would be through a change of base on the part of one of the eight Republican recalcitrants. Ingalls is the only man who can be suspected of capacity for such conduct, and it is not to be expected even of Ingalls. Moreover, there are believed to be other Republicans than the eight now openly against the Force Bill who will never lift a finger to get it before the Senate again now that it is shelved. Finally, time itself is a most effective ally of its opponents. Only twenty-nine legislative days remain before the Fifty-first Congress expires by limitation, and the growing popular demand that Senators and Representatives shall devote every hour of these few days to the hitherto neglected public business will render it constantly more easy to keep this purely partisan measure in the background. There is, consequently, good reason to believe that the danger of its ever becoming a law is now past.

The Connecticut Republicans furnish an exquisite bit of irony in sending back Senator O. H. Platt to vote for Force Bills and talk about the Mississippi Constitution and electoral irregularities at the South. In the first place, Connecticut is now herself enjoying the "irregularity" of three Governors, without any constitutional power to eliminate two of them. Moreover, in the joint legislative Assembly that reëlected Senator Platt on Wednesday week, he was supported by 141 members, representing only 73,144 votes in their towns and Senatorial districts, while he was opposed by 134 members, representing 195,840 votes. His own election thus offers Mr. Platt a capital text for explaining the practical difference between the disfranchisement of ignorant colored voters in Mississippi and the constitutional disfranchisement of intelligent white voters in Connecticut.

There can be no doubt that the anticipation of a silver crisis has already led to a shrinkage of the Treasury stock of gold to the extent of forty-three millions since July 31, 1890. There is no room to doubt that any nearer approach of the crisis will cause the depletion to go on at a more rapid rate. Nor is there much room to doubt that the present silver law will be effectual to impose the silver standard upon the country in time without the formality of free coinage. It is only a question of the income and outgo of the National Treasury. For all purposes of gold payments the expenditures for silver have exactly the same effect as the expenditures for pensions, or for battle-ships, or for river and harbor improvements. Although the silver bullion is paid for with legal-tender certificates, the Government has to take them back in payment of customs and internal revenue, and when these certificates become excessive in amount, the Treasury will be compelled to pay them in the settlement of its Clearing-house balances, and then the silver crisis will have come. But before any such eventuality shall have actually dawned, the public will have anticipated it by a run on the Treasury for gold. How much time will be required under existing laws to bring about this result, nobody can safely predict, so much depends upon the resources, present and prospective, of the Treasury. When the national-bank redemption fund was turned into the Treasury, a resource was added sufficient in amount to pay for at least a year's purchases of silver bullion. Therefore it cannot be said that the silver standard is imminent. But it is coming unless some step is taken to ward it off. The step to be taken is none other than the repeal of the present silver law, and it may be said also that it will be not more difficult in a political sense to do this than to stop the free-coinage madness. Whatever accomplishes the latter will suffice for the former also. This is made manifest by the tone of the silver newspapers, nearly all of which are disgusted with the present law, and are now for free coinage or nothing.

Those Democrats in Congress who are tempted to abandon the traditional ground of the Democratic party regarding sound money might reread with profit the excellent statement of orthodox doctrine made by the late Daniel Manning in his report as Secretary of the Treasury in 1885. In arguing against the continued coinage of silver dollars, Mr. Manning pointed out how the depreciation which must some time come would harm most of all the poor workingmen of the country. "A cheaper dollar for workingmen of the United States," he said, "means a poorer dollar. The daily wages of our workingmen and workingwomen are by far the largest, by far the most important, aggregate of wealth to be affected by the degradation of the dollar, or of any legal-tender equivalent of the dollar. All other aggregates of wealth, the accumulations of capitalists, which can only obtain profitable use by being turned over daily in the wages of workmen and the employment of the captains of their industry, all other aggregates of wealth which remain unemployed in the payment of wages of the day, the month, the year, are not to be compared in their sum to this gigantic sum. It is this gigantic sum, the wages of labor, which is assailed by every policy that would make the dollar of the fathers worth less than its worth in gold." Every word of this is as true to-day as it was in 1885, and it applies with tenfold force to the pending proposition for the free coinage of silver.

The pointed remarks of Col. Henry L. Higginson at the anti-silver meeting in Faneuil Hall ought to arrest the attention of every business man in the country. "To-day," he said, "by reason of the action of the Senate, enterprises are stopping and trade grows dull. But you cannot get confidence by merely asking for it. It comes gradually and slowly. Rich in capital as this country is, we yet need all the possible capital of Europe to develop our great resources and industries. But the present course of legislation tends to destroy the confidence that would give us this. Let us, therefore, ask Congress to pause and consider before it commits itself to this legislation, on account of the injustice that will be done to the workingman by the passage of the Silver Bill." Every man who has financial connections abroad knows that the movement of foreign capital to this country has stopped—absolutely stopped—except in cases where engagements had been made and contracts entered into before the Silver Bill was brought forward in the Senate. Some buying and selling of our stocks on the part of foreign speculators will go on from day to day in spite of everything, but investment of a permanent kind has already ceased. This means less employment for labor and less profit for business. What Mr. Higginson says about the need of foreign capital to develop our resources is true, but it is scarcely appreciated even by men ordinarily well informed. If the movement of foreign capital to the United States should continue for the next hundred years at the same rate as during the past hundred years, it is safe to say that there would still be a demand for more at remunerative rates. Even in the narrow limits of England there is still room for more capital, as is shown by the large calls made from year to year by such old established lines of railway as the London and Northwestern, the

London and Brighton, etc., whose increasing business requires increasing facilities. The demands of this country are very far from being satisfied. The South alone needs hundreds of millions of dollars *more* than the North can spare for her rapid development and enrichment. But she will not get a dollar from abroad while this nightmare of silver hangs over her.

The *Herald* on Friday had an interview with Mr. D. O. Mills, the President of the North American Commercial Company, which holds the lease of the Pribyloff Islands for seal-catching purposes. One of the statements made by Mr. Mills is extremely suggestive. He says:

"It is, perhaps, somewhat amusing to know that not more than one-quarter of the poaching is done by British subjects. The remaining three-quarters is done almost entirely by citizens of the United States. Should any serious difficulty grow out of the present contention, the British Government will be placed in the somewhat anomalous position of defending by force of arms the depredations of American poachers."

Here is a pretty state of things indeed! We have absolute control over our own "poachers," if we choose to exercise it. Yet, according to the highest testimony within reach, we allow three of our own people to go poaching for every one that goes from British Columbia. The anomalous position that the British Government would be in, of "defending by force of arms the depredations of American poachers," would be at least matched by the anomalous position that we should be in of contending against the poaching of all nations except ourselves. The "destruction of seal life" being the evil which we wish to prevent, with what face can we proceed against one British vessel while three American ships are roaming freely in the same waters on the same errand? The truth is, that Congress has never given any countenance to the pretension that its treatment of seal-catching in open waters is "poaching." It has never claimed any right to interfere with the seal-fishery, the whale-fishery, or any other fishery, beyond the three mile limit, whether the fishermen were Americans or foreigners.

There are other statements in Mr. Mills's interview that show him to be in possession of more information than has been vouchsafed to the public. For example, this:

"On the 4th of this month the Russian Government executed a lease for twenty years to a company to take seals on the Commander Islands, which are on the Siberian coast and about 1,000 miles west of the Pribyloff group. It is understood that Russia, in granting this franchise or lease, has promised protection to the company, and for this purpose it is said she contemplates strengthening her navy in her waters in the Bering Sea. Neither Canadians nor citizens of this country have ventured, except in a few cases, to attempt to kill seals in Russian waters of the Bering Sea. Whenever detected, Russia has dealt with them summarily. There is no disposition on the part of Canadian or American poachers to attempt to take seals within Russian waters, and there is no account of Canada or England protesting against Russia's seizing or punishing poachers in her waters."

What are "the Russian waters of the Bering Sea"? Do they extend more than three miles from the coast? If so, how many more? Mr. Blaine has said, in his latest communication to Lord Salisbury, that the United States has never set up a claim of *mare clausum* for Bering Sea, and that she expressly repudiates it. Has Russia set it up since we repudiated it? If not, then we ask again, what are the Russian waters of the Bering Sea? If they extend beyond three miles, do they extend thirty miles, or three hundred, or how many? And when did Russia "deal with them summarily"?

The cable summary of the proceedings in the British House of Commons on Monday says:

"With reference to the arrest in Mexico of the Captain of the English vessel *Seaforth*, the Under Foreign Secretary said that the British Consul had been instructed to watch the case on behalf of the captain and owners, adding that the usual legal remedies in the Mexican courts must be exhausted before the British Foreign Office could interfere."

How is it that the British men-of-war submit to this? Where were the "guns" of the cruisers to take the British captain out of the hands of his despicable captors, and make the Mexicans "stand round"? Some wretched British commander has been guilty of "timidity," of unwillingness to take "responsibility," and yet his Navy Department does not stir him up. And this is the "British Lion," forsooth! British jack-rabbit, rather, say we.

Mr. Josiah Quincy of Boston gave some figures concerning the expenses of the Massachusetts Ballot Act in the recent election, during his address before the Commonwealth Club on Monday evening, which were very striking. One of the stock arguments of the opponents of ballot reform has been that the system is enormously expensive, and to sustain this argument the expense of the first election under the system is always cited. Mr. Quincy showed that the total expense of the recent election in Massachusetts, the second under the new law, was $18,000, about half of which was for printing and distributing the ballots. Under the old system the ballots alone would have cost, he said, $40,000, to say nothing of the expense to each party of hiring its distributors. Best of all, the party distributor has been eliminated, and with him all the "watchers" and "heelers" about the polls.

The question of whether or not Gov. Hill should continue to hold the Governorship after his term as Senator begins on March 4, is exciting much attention from the press of this State. The newspapers most friendly to the Governor are divided on the subject, some saying that he cannot in decency hold both offices at the same time, and must therefore resign the Governorship; others ridiculing the idea, and declaring that the State cannot afford to spare him as Governor till he is called upon to take his seat in the Senate, which in all probability will not be till next December. There is no constitutional or other legal objection to the Governor's holding both offices at the same time, and drawing both salaries, but precedent in similar cases is all against his doing so, and any other man than David Bennett Hill would be expected to follow precedent without discussion. Why he should be averse to giving up the Governorship on March 4 is not difficult to understand. If he resigns by that date, he can exercise little or no control over the bills of the present Legislature, for few of them will be ready for his signature before that time. It is notorious that a very large part of his political power in the State is due to the absolute control which he has exercised over legislation, every member of whatever party dreading to oppose the Governor's desires, lest his local bills suffer in consequence when they come before him for approval. To demand that the Governor leave office in March is to demand that he give up a year's revenue from this important source of political strength, and thus hasten his lapse into political obscurity.

The State Board of Mediation and Arbitration has made a special report on the strike which took place on the New York Central Railroad last August. After reciting the facts, the Board renews in more definite form the recommendations made in three previous annual reports, that the relations of railway companies with their employees, considering their peculiar duties to the public, ought to be regulated in a quasi-military fashion, so that the service may not be suddenly and wantonly interrupted. These recommendations are summarized under the following heads:

(1.) The service rendered by railroad corporations created by the State is a public service.

(2.) Entrance into such service should be by enlistment for a definite period, upon satisfactory examination as to mental and physical qualifications, with oath of fidelity to the people and to the corporation.

(3.) Resignation or dismissal from such service to be permitted for cause, to be stated in writing and filed with some designated authority, and to take effect after the lapse of a reasonable and fixed period.

(4.) Wages to be established at the time of entry, and changed only by mutual agreement, or decision by arbitration of a board chosen by the company and employees, or by a State board, or through the action of both, the latter serving as an appellate body. Other differences that may arise to be settled in like manner.

(5.) Promotions to be made upon a system that may be devised and agreeable to both parties.

(6.) Any combination of two or more persons to embarrass or prevent the operation of a railroad in the service of the people, a misdemeanor; and any obstruction of or violence towards a railroad serving the people, endangering the safety of life and property, a felony with punishment of adequate severity.

(7.) Establishment of a beneficiary fund for the relief of employees disabled by sickness or accident, and for the relief of their families in case of death, as is done upon the lines of a number of railroad corporations in other States.

These recommendations may have the appearance of severity to both employer and employee, but they are essentially just, and are becoming more and more urgently necessary for the protection of public interests. We are convinced that, as time goes on, public opinion will move in the direction of a semi-military organization of the rail-

way service, in the interest of *all* the parties concerned. It need never be feared, in a democratic society like ours, that the terms of enlistment will bear hardly upon the employee.

The Scotch railroad strike is apparently over, after having inflicted enormous loss on both the men and the railroad companies. It has had the good effect, however, of causing a movement in Parliament towards legal reform in the railroad service, which will doubtless before long end in some sort of legislation on the subject in the direction suggested by our State Board of Arbitration. That is to say, it is now proposed, in order to prevent a recurrence of these sudden interruptions of the great lines of public communication—interruptions almost as serious as those caused by actual war—that the companies should *enlist*, and not simply hire, their men, under rules and regulations prescribed by the State for a fixed term, as in the army, and that strikes during this term should be punishable as mutiny. In fact, under the existing conditions of transportation in modern commercial nations, a railroad or telegraph force which can stop work at pleasure is as great an anomaly and inconvenience as an army would be which could disband at pleasure while in active service. Making the men sign individual agreements to give notice before leaving the service does no good, because the Scotch companies tried this, but found that it did not prevent the sudden desertion of their train hands and switchmen. Of course, no such service would be provided for the railroads without imposing rigid restrictions on the companies in the matter of hours and wages and conditions of dismissal, but these restrictions would give them a picked body of men, like the police and fire departments, and give the stockholders and the public peace of mind. When we made this suggestion apropos of the telegraphers' strike seven years ago, many people were shocked by it, but time has demonstrated the absolute necessity of the reorganization of the great transportation and communication service of every great nation on a semi-military basis. Our railroad strikes in this country have one aggravation unknown in Europe, in the necessity under which they nearly always place the companies of hiring an armed force to protect their property and the lives and limbs of the employees who remain faithful to them as long as the strike lasts.

The sudden dissolution of the Austrian Reichsrath, which anticipated the expiration of the six-year term of its members only by a few months, is an unmistakable admission on the part of Count Taaffe of the complete failure of the "reconciliation" between Germans and Czechs effected by him less than a year ago. Ever since the consummation of that rather ridiculous love-feast, the radical Young Czechs, under the leadership of Gregr, who had been excluded from the reconciliation conferences, have waged a bitter warfare against the Conservative Old Czechs, whose leader, Dr. Rieger, signed the agreement with the Liberal Germans conceding the equality of the German and Czech languages in the administrative matters of Bohemia. The rapid disintegration of the Old Czech party now going on, and the boundless demands of the Young Czechs, have deprived Count Taaffe of all his supporters in the Czech camp. The programme of the Young Czechs is simply complete autonomy of the lands of the Crown of St. Wenceslas, and Taaffe is hardly prepared to transform the Austro-Hungarian dualism into a federalism. Neither can he sanction the position of Herr Rieger, who, in order to save even the shadow of his former influence over his countrymen, contends that the compact entered into between him and Taaffe was merely of a private nature, and hence revocable, and who now insists, agreement or no agreement, that the Czech is the only proper Government language for Bohemia. That the Liberal Germans are not without hope of profiting by the quarrel between Old and Young Czechs and Count Taaffe's embarrassment, is evident from the altered tone of the *Neue Freie Presse*, which has of late treated the Minister with a consideration never before shown him during the ten years of his premiership. It is not impossible, unless the Government is hopelessly beaten in the impending elections, that the Liberal Germans may range themselves in the next Reichsrath on the side of the Poles, Slovens, and other Slavs, who, with the now estranged Czechs and the Feudalists and Clericals, have hitherto constituted Taaffe's working majority. The cable confusingly speaks of Taaffe's having "abandoned dependence on Bohemian and Slav members," and of an ultra-Liberal Government manifesto making a "large bid for the support of the Young Czechs"; but he would be a rash prophet who, in the present condition of Austrian affairs, should deny the possibility of Taaffe's resorting to the most contradictory measures in order to retain the reins of Government.

German Liberalism is deriving a good deal of comfort from the recent resignations of the two principal members of the Evangelical High Consistory, Herren Kögel and Hegel, who, shortly before the close of the last year, shared the fate of the notorious Stöcker. Rightly or wrongly, these dismissals are interpreted as involving a complete change in the ecclesiastical atmosphere of the Berlin Court, and as heralding the dawn of a more liberal era. The Court-Preacher Kögel was, intellectually and morally, a man of much stronger fibre than Stöcker, but he was an equally pronounced enemy of rationalism and an even more persistent and implacable antagonist of Bismarck. For sixteen years he wielded a power often superior to that of the Minister of Public Worship; but after having time and again triumphed over Herr Falk, in the face of whose opposition he became Superintendent-General and arbiter of the fate of theological candidates for public appointment, he was finally beaten in his encounter with Herr von Gossler over the Harnack affair. It will be remembered that when, about four years ago, the theological faculty of the University of Berlin extended a call to Prof. Adolph Harnack of Marburg, one of the most learned and liberal theologians of Germany, the High Consistory, through Dr. Kögel, protested against his confirmation as that of an "infidel." Minister Gossler's demand for specific charges was met by Kögel's demand for sufficient time for a thorough study of Harnack's writings, and thus the matter was delayed until the illness of the then Crown Prince Frederick William and the subsequent death of the Emperor William pushed it into the background. It was not until after the accession of the present Emperor that Herr Kögel felt emboldened to come forward with a formal protest of the Consistory against the appointment of Prof. Harnack. This step, however, irritated Herr von Gossler to such a degree that he tendered his resignation in case Herr Kögel's opinion prevailed over that of the University of Berlin, and Bismarck, then still at the height of his power, instructed the other Ministers to act in this matter as one man. This settled the dispute, and from that time Kögel's political influence was a thing of the past, although, owing to his undeniable rhetorical powers, his popularity as a preacher remained undiminished. The retirement of Herr Hegel, the President of the High Consistory, although probably the logical result of the dismissal of Stöcker and Kögel, was to be expected before long in the natural order of things, as he is in his seventy-seventh year. He is the son of the philosopher, and was all his life, politically and ecclesiastically, a reactionary of the deepest dye. He prosecuted in his ecclesiastical capacity the preachers Lisco and Sydow, who in their public utterances had been guilty of somewhat liberal sentiments, and he was generally considered to have inspired the Ultramontane measures introduced in the Prussian Diet by such members as Von Hammerstein and Kleist-Retzow.

The rejoicings of the Liberal press of Germany over the downfall of this ecclesiastical triumvirate are somewhat tempered by the reflections to which the recent retirement of three of the most prominent military writers of Germany, Gens. Verdy du Vernois and Boguslawski and Col. von Widdern, has given rise. The *Hamburger Nachrichten* deplores this stifling of the literary activity of the best military minds, and points to the beneficent results achieved nowadays in France by the opposite policy. But it may be remarked that it is not the first time in Prussian history that royal disfavor has followed the public expression of military opinion. The virtual banishment of Gen. von Goltz, who in 1883 entered the service of Turkey, and the court-martialling in 1848 of Lieutenant—subsequently Swiss Colonel—Rüstow, one of the ablest and most prolific military writers of this century, are notable instances in point.

THE REITER FOG.

A NEWSPAPER correspondent has sought to obtain from the Secretary of the Navy a statement of the rule of law, municipal or international, which he has used in disposing of Commander Reiter's case. There was nothing impertinent in the inquiry. Commander Reiter's case is not a case simply of naval administration or discipline. It is a case which evolves new instructions to American naval commanders in foreign ports, and as such is a question of law and politics of the highest public interest, inasmuch as it might at any time plunge the country in foreign complications of a very serious character. Secretary Tracy has, therefore, no right to be reticent about it. We do not demand that he shall explain his position in the newspapers: he has a right to refuse to do this. But having failed to explain in the proper place—that is, his two letters to Commander Reiter, one of which he allowed to get into the newspapers before Commander Reiter received it—he was bound to take the earliest opportunity of explaining it *somewhere* in such manner as he deemed appropriate. It will be the duty of Congress, whenever this hurly-burly is over, to extract it from him by way of legislative inquiry.

The correspondent, having failed with Secretary Tracy himself, went to an authority which for all practical purposes "is equally high in naval matters," and got his account of the Secretary's position. This gentleman put in the forefront of the charge against Commander Reiter his having gone ashore to consult the Minister, Mr. Mizner, instead of acting on his own responsibility, and makes a great deal of the point. We judge from an evidently inspired article in the *Tribune* that Reiter's "timidity" about assuming responsibility, as illustrated by his consulting the American Minister (an able lawyer, by the way, and a man of high character), is the particular cloud under which both the Navy and State Departments propose to take refuge. But nobody cares anything about Reiter's character as a man of resolution. What the public wants to know, and has a right to know, is, what was the omission in the harbor of San José on the 28th of August, of which his alleged timidity led him to be guilty, and for which he has now been so severely punished? Even Secretary Tracy, in his angriest mood as "ruler of the Queen's Navee," would not dismiss an officer from his ship, with a severe reprimand, for simply going ashore, when in a puzzling situation, to see what the American Minister thought about it. Commander Reiter has been punished for having, after taking the Minister's advice, allowed the Guatemalan authorities to do something in their own harbor which he ought to have resisted by force. What was that thing? Whatever it was, would it have been lawful for him to resist it? These are the questions which the Secretary of the Navy is bound to answer somewhere somehow.

The correspondent pressed the equivalent authority on this point as follows:

"But had not the local powers a right to treat a merchant vessel entering their waters voluntarily, as the *Acapulco* did, as within the jurisdiction of their laws?"

This goes to the heart of the matter, as we shall presently show. Here is the answer he got:

"Not to the extent of taking forcible possession of the body of a passenger. Whatever they may have claimed as their right, it was no part of our business to recognize it. As long as Gen. Barrundia was a passenger on an American ship, it was our duty to see that he should be free to go and come as he chose."

That this is an extraordinary answer to come from the Navy Department of a great Power, any intelligent reader may see at a glance. It disposes of the question of law very much as Paddy Divver might dispose of it. "Whatever they may have claimed as their right, it was no part of our business to recognize it." That is, an American naval officer was not, in a foreign port, to consult his authorities to find out what his attitude towards the local authorities ought to be as decided by civilized usage, but "to use his guns without appeal." Now, let us see what these authorities are. Mr. Alexander Porter Morse has collected some of them in an article published in the *Albany Law Journal* apropos of this very Barrundia affair. Said Secretary Everett, February 17, 1853, "Merchant vessels in port are subject to the police law of the port." Said Secretary Marcy, August 31, 1855:

"If the United States claim jurisdiction over all offences committed on board of foreign private vessels in their harbors or waters, they cannot with consistency assert the right to have their citizens exempt from the jurisdiction of the local authorities when they commit similar offences in foreign ports."

Said Secretary Marcy again, April 19, 1856:

"This Government does not apply the doctrine of extra-territoriality to its private or merchant ships in foreign ports, except in cases where it has been conceded by treaty or established usage, and it does not pretend that it has been so conceded in criminal cases to American merchant vessels in British ports."

Said Secretary Frelinghuysen, November 13, 1883:

"I find no difficulty in agreeing with your statement that, by the general principles of international law, private or merchant vessels entering the ports of another nation than their own are subject to local jurisdiction; and I also recognize at once the convenience and desirability of the rule you suggest as that adopted by France, and followed by some other nations, that local courts should decline to take jurisdiction of cases involving acts of mere interior discipline of the vessel."

Said Secretary Bayard, apropos of the Gomez case—one exactly like Barrundia's—March 12, 1885:

"It may be safely affirmed that when a merchant vessel of one country visits the ports of another for the purposes of trade, it owes temporary allegiance and is amenable to the jurisdiction of that country, and is subject to the laws which govern the ports it visits so long as it remains, unless it is otherwise provided by treaty. Any exemption or immunity from local jurisdiction must be derived from the consent of that country. No such exemption is made in the treaty of commerce and navigation concluded between this country and Nicaragua on the 21st day of June, 1867."

Finally, what was Commander Reiter taught by the 'Naval Encyclopædia,' a textbook in which the article on International Law was written by Mr. Soley, the present Assistant Secretary of the Navy—a very competent person—in the following passage? The writer, after discussing the immunity of public ships from such jurisdiction, proceeds:

"To private or merchant vessels no such immunity is granted. They have no exemption from the jurisdiction of the State in which they are, except by express convention. Police officers may go on board such vessels, their officers or seamen may be arrested on board, writs may be served, and crimes occurring on board by whomsoever committed are triable in the local courts."

There is a swarm of judicial opinions and opinions of book-writers of like tenor and effect. We shall not claim here that they absolutely settle the Barrundia case, but we do say that it is a monstrous and unprecedented thing that the head of the navy of a great maritime Power should give the commander of a public ship to understand that he may ignore them, and that it is "no part of his business" to regard the rights of the local authorities in foreign countries, and should punish and denounce an officer for even hesitating to use force in resisting a local warrant.

THE POPULATION OF NEW HAMPSHIRE.

CENSUS BULLETIN No. 21 gives the population of New Hampshire by counties and minor civil divisions. An analysis of the figures proves that while the population of the State as a whole has, during the last decade, increased from 346,991 to 376,530, or at the rate of 8.51 per cent., three-fifths of all the towns in the State have now less population than they had ten years ago. The following table shows, moreover, that the majority of the towns in each of eleven out of the twelve counties in the State have fewer inhabitants than they had in 1880. The exception is the County of Coos, which includes the thinly settled northern extremity of the State.

The table is as follows:

Counties.	Total number of towns, etc.	Number of towns, etc., showing increase of population.	Number of towns, etc., showing decrease of population.	Number of towns, etc., no change in population.	Number of towns, etc., for which no comparison can be made.
Belknap.....	11	3	8		
Carroll.....	18	7	11		
Cheshire.....	23	10	13		
Coos.....	35	17	8	2	8
Grafton.....	39	11	28		
Hillsborough..	31	11	20		
Merrimack....	27	8	19		
Rockingham..	37	15	22		
Strafford.....	13	6	7		
Sullivan.....	15	3	12		
Total	249	91	148	2	8

A still further analysis of the census returns demonstrates that the decrease has been almost wholly in the smaller and agricultural towns. In 1880 there were twenty-eight cities and towns each of which contained more than 2,000 inhabitants. Of these, twenty-seven show an increase, and only one (the town of Hanover, in Grafton County, which in 1880 had a population of 2,147), a decrease. Of the towns with a population

of from 1,500 to 2,000, nearly as many show a decrease as an increase, and the increase of these towns in the aggregate is but 4 per cent. The majority of the towns with a population of between 1,000 and 1,500 have lost population, and the decrease in the aggregate population of these towns in the decade has been over 4 per cent. The decrease has been the greatest in the towns with the smallest population, the towns with less than 1,000 inhabitants each having suffered a loss of 10 per cent. since 1880.

The following table illustrates very clearly how the larger places are growing and the smaller ones losing population:

Towns & cities classified according to population in 1890. Population	No. of such towns.	Population. 1890.	Population. 1880.	Gain or loss.	Percentage.
Over 20,000.....	1	44,126	32,630	+11,496	+35.23
10,000 to 20,000	3	49,105	38,927	+10,178	+26.15
4,000 to 10,000	8	50,953	43,172	+7,781	+18.02
2,000 to 4,000	23	63,271	52,609	+10,662	+20.26
1,500 to 2,000	20	34,184	32,867	+1,317	+4.01
1,000 to 1,500	49	59,168	61,734	—2,566	—4.16
Under 1,000....	145	75,723	85,052	—9,329	—10.97
Total.....	249	376,530	346,991	+29,539	+8.51

+ Increase. —Decrease.

The cities having over 10,000 inhabitants each in 1890 have increased almost a third during the decade, and those between 2,000 and 1,000 nearly a fifth, while the towns with a population in 1890 of between 1,000 and 2,000 have suffered a slight decrease, and those with less than 1,000 inhabitants each have lost nearly one-ninth of their population. This increase in the larger and decrease in the smaller places has been going on for the last forty years, as the following table will show:

Date of census.	Population. Of 35 towns having upwards of 2,000 inhabitants each in 1890.	Population. Of 69 towns having between 1,000 to 2,000 inhabitants each in 1890.	Population. Of 145 towns having less than 1,000 inhabitants each in 1890.	Percentage of total population. In towns over 2,000.	Percentage of total population. In towns between 1,000 and 2,000.	Percentage of total population. In towns under 1,000.
1890..	207,455	93,352	75,723	55.10	24.79	20.11
1880..	167,338	94,601	85,052	48.23	27.26	24.51
1870..	137,440	92,314	88,555	43.18	29.00	27.82
1860..	126,235	97,815	102,020	38.71	30.00	31.29
1850..	113,506	97,628	106,842	35.69	30.71	33.60

Since 1850 the population of the larger places has nearly doubled. That of the towns with from 1,000 to 2,000 inhabitants in 1890 has slightly fallen off, while that of the smaller towns has decreased almost one-third in the aggregate. The falling off in particular towns has, of course, oftentimes been much greater. In 1850 the thirty-five larger towns contained but a trifle more than a third of the entire population of the State; they now have considerably more than one-half. Forty years ago the smaller towns had a third of the population, and now but a fifth.

THE HARTLEPOOL ELECTION.

English politics has, during the past seven years, produced a great many surprises, and the result of the Hartlepool election is probably one of the greatest. The borough is an important one, and was long held by the Liberals. It was won by them at the general election in 1885, by 3,669 to 2,629. It was, however, lost by the Gladstonians at the general election in the following year, the Liberal Unionists carrying it by 3,381 to 2,469 over the Home-Rulers. This year, although the Liberal Unionists' candidate, Mr. Gray, was considered exceptionally formidable, being exceedingly popular and the largest employer of labor in the borough, the Home-Ruler has carried it by 4 603 against 4,305, the vote being the fullest on record. The Gladstonians have been looking forward to this election, the first since the Parnellite catastrophe, with the deepest apprehension. It was to be the first indication of the effect produced on the English voters by the Irish divisions and the revelation of Parnell's turpitude, and the result was expected by the Unionist press with unconcealed glee. They had no more doubt about it than they had about the Kilkenny election, when Lord Salisbury advised "them to put their money on Parnell." The Home-Rulers were to be routed once more. Gladstone was to be repudiated, fall sick, and then, after a short period of decay, to die, and the reunited Liberal party was to lay the Irish question aside, hand the Irish over to Mr. Balfour, and occupy itself exclusively with English reforms. The Unionist depression is now doubtless correspondingly great. The two leading organs, the *Times* and the *Standard*, acknowledge that the situation is serious.

The Gladstonian victory is probably due to two causes. One is the personal popularity of Gladstone, which has, according to the best accounts, been increased by the Parnellite trouble. Popular sympathy for the "Grand Old Man" has been intensified by Parnell's brutal insults, and by the mortification and disappointment which the revelation of Parnell's baseness has caused him, and by the dignity with which he has borne all. Moreover, the mass of the English voters are not blinded, as the upper classes are, by personal hatred of Gladstone. There has been nothing more discreditable in English history to the mind and manners of the English gentry than the silly stories which they circulate about Gladstone's personal character, and which a considerable number of them, doubtless, believe. They, in truth, make out Gladstone to be a far worse man in all respects than Parnell, forgetting the awful disgrace which this, if true, would reflect on English morals, and forgetting, too, how far below the Irish Parnellites this would place one-half of the British people. The middle and laboring classes are not the victims of this amazing fatuity. They have too much "horse sense" to suppose that a man could reach Gladstone's age in a blaze of publicity such as has probably never surrounded any Englishman, without ever having had any more serious charge made against him than that of having changed his mind suddenly, or contradicted himself on public matters, at various intervals in the course of fifty years of public life. They note, too, that the loudest of his accusers on these points have been the most notorious political weathercocks and turncoats in England.

The second reason is probably still more powerful, namely, the popular perception that though Parliament might lay aside Home Rule, it could not lay aside the Irish question. Home Rule is simply one proposed mode of solving the Irish difficulty. It may be a bad mode, but resolving not to try it would not dispose of the Irish trouble any more than dismissing a particular doctor would cure a man of a chronic disease. No party can come into power in England without having to make the state of Ireland its first concern. The Irish have, and are likely to have, eighty-six votes in the House of Commons. These votes cannot be treated as a "neglectable quantity." British business cannot be transacted in Parliament without either getting rid of them by the disfranchisement of the Irish voters, and the government of Ireland as a Crown colony, or by the adoption of rules of procedure which would seriously impede legislation and humiliate the House of Commons in the eyes of the country. The notion that either of these expedients could be adopted in the present temper of the English people, without just as much turmoil and as much preoccupation of the popular mind as the Home-Rule expedient causes, seems almost childish. The Irish question would still remain, and would have to be fought over until it was settled, if Gladstone were to die to-morrow. It is only in part an economical question; it is in the main, like similar questions everywhere, a sentimental question. No people on whom the feeling of nationality and the desire for self-government have once taken hold, has ever been bought off by the offer of material comfort. Scores of conquerors have tried it in vain in times when it was easy to get rid of malcontents by killing them. It has less chance of success now than ever, and the offer of it, as now made to the Irish by Lord Salisbury, Balfour, and Mr. Chamberlain, accompanied with jeers and insults, is probably the most unpalatable and futile form it has ever taken.

The result of the election in Hartlepool seems to be put in some danger by the allegation that Furness, the successful candidate, who is, like his opponent, a large employer of labor, promised to employ none but members of the trades-unions, which the Conservative lawyers are disposed to consider a violation of the Corrupt Practices Act—that is, as something in the nature of a bribe. The defeat has been so mortifying and unexpected to the Tories that they will doubtless petition against Furness's return if they have a leg to stand on. But, luckily, election petitions

are tried in England by the courts of law, just like the title to property or to any other office; so that there is no danger of foul play. If Furness be unseated on this ground, it will, however, hardly help the Conservatives much in Hartlepool. The general election cannot be far off, and, when it comes, Furness will not need to make any express promise to get the support of the workingmen, who will probably consider him a martyr. One of the curious features in the working of the Conservative mind at present is that they feel consoled if they can show that a Home Ruler owed his election, not to Home Rule, but to something else, as if it was of any practical importance how a Home-Ruler gets into the House of Commons, as long as he gets there and supports Home Rule.

THE RESPONSIBILITY OF HYPNOTIC SUBJECTS.

THE Gouffé murder trial, which has just taken place at Paris, is an event of more than passing importance, as being probably the first case in which hypnotic suggestion has been set up as a defence by a person charged with crime. The practice in French courts is so different from our own, and the reports of newspaper correspondents are so exclusively confined to irrelevant matters, that it is by no means easy to ascertain precisely what questions were determined; but, so far as we can judge, they appear to have been the following: The first was a particular proposition: Did the woman Bompard commit the act with which she was charged while under the influence of hypnotic suggestion? The second question was general: If the commission of a crime is suggested to a person in the hypnotic state, may the will be so affected as to make the person committing the crime, after such suggestion, irresponsible? Although the negative answer, which seems to have been found by the jury to the first question, made the second inquiry unnecessary, the decision, as we understand it, involved the negation of both propositions.

While such a conclusion, if satisfactorily reached, would be highly reassuring, we are unable to attach much weight to the decision in this case. The evidence may have been sufficient to justify a finding that the woman Bompard did not commit the crime after hypnotic suggestion, although it does not seem that that issue was properly presented. It appeared that when a girl she had been seduced by a man who had hypnotized her, that she had been repeatedly hypnotized, and that she could be easily thrown into the somnambulistic trance. But, as the trial was conducted, this evidence could hardly have been considered by the jury. The Government refused to allow M. Liégeois of Nancy, one of the greatest authorities on hypnotism, to see the prisoner, for the reason that the Procureur-Général declined to admit that the opinion of three physicians should be "controlled" by a professor of law. The prison-physician who had attended the woman for eleven months, and had made use of his position to hypnotize her repeatedly, when called for the defence refused to testify, pleading, after having been released by the prisoner, his professional privilege. He declared that he considered that his patient had no right to relieve him of his obligation to secrecy—a proposition which seems to have been accepted as law by the court.

This contribution to jurisprudence was added to by the Procureur-Général, who laid it down that the prison-doctor could not testify, because he had made his experiments in his private capacity, which he had no business to do, and for the further reason that he had probably been imposed upon by his patient. The prisoner's counsel attempted to reply to this, but was suppressed by the court. Some of the audience murmured and were expelled. And so the trial proceeded in the melodramatic manner thought by the French to be favorable to the promotion of justice, but which seems, judging from these incidents, to be about as well calculated for the scientific ascertainment of truth as that followed in Wonderland in the celebrated case of the Knave of Hearts.

It was asserted by M. Liégeois that if the woman were hypnotized and asked about the crime, she would give an accurate account of the manner in which it was perpetrated. This experiment was proposed by the defence, but rejected by the Government upon the ground that the prisoner was a liar and had a turn for acting. It seems to have been thought that her mendacity would prevail even in the hypnotic state, and that shamming could not be detected. Certainly it is much to be regretted that the experiment was not tried, as its importance for both scientific and legal purposes is obvious. It suggests new possibilities in the way of detection of crime, which might go far to neutralize the temptation of the facilities supposed to be afforded by hypnotism for its commission.

As to the question of the responsibility of hypnotics, the conclusions reached by a jury under such conditions as we have described seem to us to have no value. The *Spectator*, it is true, claims to have followed all the experiments, and considers that the Procureur-Général, M. Quesnay de Beaurepaire, has rendered it clear that in the artificial sleep "the will was always sufficiently strong to frustrate malevolent counsels." In support of this proposition he alleged the authority of Dr. Charcot of the Salpêtrière. But we fail to be impressed with the reasoning by which the Procureur disposed of the testimony of Dr. Liégeois, reasoning which the *Spectator* finds so conclusive. "The Nancy School," said this functionary, "declared that to hypnotize a person, neither sleep nor the imposition of hands was necessary; a mere glance thrown from one end of a railway carriage to another was quite sufficient. . . . The consequences of that doctrine would be that there would no longer be any morality or any conscience. Man would not be distinguishable from the brute creation; he would disappear in the anarchy of unpunished crimes. That was why it was impossible to mention the Nancy School without a smile, and that smile was the most eloquent of answers." It is scarcely necessary to say that a question of fact is not to be disposed of by observations upon the alarming consequences that may be expected from its establishment, or by the most eloquent of smiles.

As opposed to this conclusion, we may cite several eminent authorities. Prof. James, in his recent work on psychology, states that subjects in the hypnotic condition "will receive and execute suggestions of crime, and act out a theft, forgery, arson, or murder." It is true that this is not always the case, but it is the case in the deeper conditions. "The background thoughts still exist, and have the power of *comment* on the suggestions, but no power to inhibit their motor and associative effects." Post-hypnotic or deferred suggestions "succeed with a certain number of patients, even when the execution is named for a remote period." During the interval preceding their execution the patient may be absolutely ignorant that they have been deposited in his mind. The moment the suggested performance is over, the patient may forget it and deny all knowledge of it.

Still more to the point are the statements of MM. Binet and Féré. If arms are given to the subject,

> "he may be induced to commit any crime which is prompted by the experimenter. We could cite several acts, to say the least unseemly, committed by hysterical patients, which were crimes in miniature, and instigated by one who was really guilty, and who remained unknown. At the Salpêtrière a paper-knife has often been placed in the hands of an hypnotic subject, who is told that it is a dagger, with which she is ordered to murder one of the persons present. On awaking, the patient hovers round her victim and suddenly strikes him with such violence that I think it well to refrain from such experiments. . . . It was suggested to a subject that she should poison X—— with a glass of pure water which was said to contain poison. The suggestion did not indicate in what way the crime was to be committed. The subject offered the glass to X——, and invited him to drink by saying, 'Is it not a hot day?' (It was in summer). . . .
>
> "These facts show that the hypnotic subject may become the instrument of a terrible crime, the more terrible since, immediately after the act is accomplished, all may be forgotten—the crime, the impulse, and its instigator. Some of the more dangerous characteristics of these suggested acts should be noted. These impulses may give rise to crimes or offences of which the nature is infinitely varied, but which retain the almost constant character of a conscious, irresistible impulse; that is, although the subject is quite himself, and conscious of his identity, he cannot resist the force which impels him to perform an act which he would, under other circumstances, condemn. Hurried on by this irresistible force, the subject feels none of the doubts and hesitations of a criminal who acts spontaneously; he behaves with a tranquillity and security which would in such a case insure the success of his crime. Some of our subjects are aware of the power of suggestion, and, when absolutely resolved to commit an act for which they fear that their courage or audacity may fail when the moment arrives, they take the precaution of receiving the suggestion from their companions.
>
> "The danger of these criminal suggestions is increased by the fact that, at the will of the experimenter, the act may be accomplished several hours, and even several days, after the date of suggestion. Facts of this kind, which were first reported by Richet, are not exceptional, and have been repeatedly observed by us."

It is obvious that the principles involved in this case deserve careful study, and we trust that students both of psychology and of jurisprudence will procure the fullest

possible reports and subject them to the severest scrutiny. It seems quite probable that legislation may become necessary to regulate the exercise of a power which may be seriously abused by unscrupulous persons, and we are perhaps already in position to lay down the lines which such legislation should follow. The exercise of the power should certainly be forbidden to all except properly qualified and duly licensed persons, and even then it may probably be wise to restrict its use to cases where benefit may reasonably be expected to follow to the individual patient. The devotee of science is under too great temptation to make use of a peculiarly helpless class of human beings as the subject of experiment, to be allowed absolute license. The inmates of hospitals are human beings, and are entitled to protection against practices which, however ultimately beneficial to mankind, are sometimes immediately degrading and prejudicial to themselves. The consent of the patients is obviously, under the circumstances in which they are placed, immaterial. It admits of no doubt to one who reads the reports of the experiments made in foreign hospitals, that the treatment to which patients are frequently subjected would, if known, excite the indignant protests of their relatives and friends.

ENGLISH VIEWS OF THE COPYRIGHT ACT.

LONDON, January 5, 1891.

I HAVE taken pains to ascertain the feelings of authors and book-manufacturers as to the proposed American Copyright Act, and have read the numerous daily and weekly comments in the public prints. At this distance it looks very much as if the House of Representatives, chagrined at the censure which the recent elections have put upon it, had turned about since last winter, when it rejected the act, and, because of its element of protection, had committed itself to the measure out of spite, and to show that the McKinley spirit is not yet dead. A nearer acquaintance with the political complexion of the favorers of the act might disprove this remote commentary. English authors seem not to be discontented, and, except so far as their interests are linked with those of the publishers, have no particular occasion to be; and it seems to be the general opinion that a few, William Black, for instance, among them, will profit largely. Some put his prospective profits at five thousand dollars a year, though others think such a sum a great exaggeration. Some authors, like Herbert Spencer, who have been in the habit of sending over on their own account duplicate plates of their books, see little to be gained by themselves, and are content with securing the start in publication; and indeed that advantage is sufficient for books not profitable to reprint against such odds.

There is, however, no such degree of contentment among the manufacturers of books, and some of the leading houses share a feeling of resentment mixed with sentiments of self-interest. In small conferences and larger councils, there seems to be a determination to seek a remedy in Parliament, and I should judge it certain that the next session would see a bill introduced retaliatory in spirit if not in form. This last condition will be in some sense avoided by making adhesion to the Convention of Berne necessary to the securing of copyright in any country. A muttering that showed the nature of the opposition has deterred them from attempting a directly retaliatory bill, as was first talked of, and it is to be disguised in this form, while still in effect of a retaliatory nature. It is apparently hoped that this semi-concealment is to satisfy enough of the uncompromising free-traders to make them aid in carrying the measure. There are among its aggrieved promoters varying degrees of confidence in success, but all recognize the fact that, disguise the measure as you will, its aim is unmistakably a protection for those who subsist on the manufacture of books.

Taking people not having a personal interest in the matter, as I hear the talk at the clubs, and as I draw out views from such members of Parliament as I have met, the opinion is all but universal that the measure will not succeed. The argument among such indifferent persons is that, call it what you will, it is a protective measure, and England is too far committed to free trade ever to break its record for a single interest, which is sure to be followed by the claims of innumerable other interests if a beginning is made. To this plea an answer is given that literary property is on a different footing from other property, and it can be hedged about consistently with barriers unsuited to other property. It remains to be seen if this argument will be of any avail. I suspect that it will not.

Most unbiassed people think that the loss to British printers under the operation of such an act as is proposed in America, is nothing like so great as those now in a disturbed condition of mind represent that it will be, and that the number of British authors to be tempted to print their books in America is not great, and hardly sufficient to disturb seriously the conditions of the publishing business. There can be little doubt that the disturbance in this direction will not much affect well-established houses.

People here, in talking of this matter, sooner or later say that any copyright reciprocity, pure and simple, must in any case help the American more than the British author, because of the number of British books to be copyrighted in America being greater than those of American books to derive advantages from a British copyright. We can only meet this assertion by saying that our fecundity is on the increase, and there may yet be, before very long, an absolute equality in such reciprocity. This is very readily conceded.

The scholarship of America is by no means so dependent on British books as this statement implies. It means rather that the great mass of general readers and ordinary book-buyers are served by the British author; and publishers and dealers here recognize the fact that America is a larger market for books than England, but they are not quite so ready to acknowledge that there is more reading in America than in England, proportionately at least. They point to such establishments as Mudie's, to the clubs which are everywhere, and to the rapid increase of public libraries, and the joining of reading facilities to the innumerable charitable and other organizations, which are at every turn.

There is little doubt that the scholars of America look rather to Germany than to England for their sustenance. The experience of our largest university library is the best test on this question. I write of Harvard as best known to me. There are in Cambridge, Mass., not far from two hundred and fifty special scholars, engaged in instruction and in the pay of the University. There must be at least as many more students, more or less connected with the University, who are equally specialized in their scholastic aims. These are the men who prompt the purchases of that library, and, to answer their wants, more books have been bought for several years past in German than in English or French. For the second place, it is sometimes English and sometimes French. It is not difficult to discover the cause of this. The Germans are the greatest monographists now writing, and the greatest need to specialized scholarship is the monograph. The difference in the helps to literary and scientific attainments between the English and German productions is considerably greater than the mere excess of German books bought by the leading university library over the English, inasmuch as the proportion of monographs in the German accessions is much larger than in the English. The same reasons hold good when we seek to find why it is that large numbers of Americans seek the German universities, and why so few go to Oxford and Cambridge. There is a far greater variety, as well as a greater minuteness of research, in the methods of Berlin and Leipzig than in the English universities. This is recognized here, and people understand the preferences which the Americans have for the Continental schools, the advantages of which are, further, much more easily availed of by a specializing foreigner than the instruction is in England.

The British educational inquirer is somewhat inclined to flout at German erudition as unproductive of a high state of literature, and there is truth in it, and one does not look in America on classical education running into philology to the neglect of the literary side without some misgiving, as to the over-close dependence which we have on German methods. That a reaction will in time follow I have no doubt, and we shall return to the classics as to books to be read, rather than as fields of philological problems to be discussed, and we shall so return all the better prepared for their enjoyment by reason of the phase of German study which now so much dominates in the classical curriculum of our colleges. We must not forget that it is only within a comparatively few years that American scholarship in the classics could compete with European. As long as study must be had of manuscripts, America had no chance; but now that nearly every manuscript of importance has been edited, or at least its readings collated, and the results printed, the American scholar has as good an apparatus as the European. There is nothing, I find, that has made English classical scholars so sensible of this as the works of Prof. Goodwin, solved with such facilities as time has given to us, for he is acknowledged on all hands here in England as second to no one in his department.

I have referred to the increase of public libraries in England. Nothing is more noticeable in the drift of opinion regarding such institutions than that London, in its immensity, has been the last to feel the general impulse; and in no part of the island is the spirit which prompts and supports municipal free libraries more active at the present time than here. Not long since, Sir John Lubbock—and no more active-minded and laborious Englishman exists—set forth in an address at the opening of one of these libraries the extent of the cost of maintaining such institutions, as compared with the cost of suppressing the crime from which, he contends, the libraries divert the lower classes; and there seems little disposition to question his arguments. With all this, one looks on with amazement at the stubborn, old-fashioned ways in which these libraries spring

into existence, each parish working out its problem in its own manner, regardless of experience to be afforded by others, and mulishly valuing what they deem to be their own right to do everything just as they please higher than any wisdom which can be acquired as a gift. I had supposed, with our New England habits of local independence inherited from a struggle which separated us from England, that the method of a more rational and thrifty way of maintaining such libraries encountered more opposition with us than in the older countries from which we sprang; but it seems to be the opinion of experts in library matters here, that nothing can surpass the crass obstinacy of parish committees to have their own way at any cost of money and of failure. Except for the proverbial slowness in reform in England, one would say that the example across the Channel, in the opportune and beneficent workings of that large circle of provincial libraries regulated by the Société Franklin in Paris, would have some effect in England; but I cannot find that even the best informed supporters of the English library system have ever made a study of the organization in France. In this method, as in living and in much else, the French have taken the lead in showing us how a given sum of money can be made to go furthest.

Last winter I tried to impress upon a committee of the Massachusetts Legislature, who called me before it, the value of this French system, and that the project then before them of beginning a system of State aid to small local libraries could with great advantage be accompanied by measures looking to bring all libraries of their creation into a circle of dependent libraries, alike in the main features to the several hundred now regulated by this Paris society. The plan involved a central bureau in Boston, in whose constitution there must be confidence, which should select and furnish all books, furniture, printing, and supplies, using what money the local libraries could raise, and supplementing it by such other funds as the State or subscriptions might afford. The advantages would be more discrimination arising from larger experience, greater discounts from more extensive operations; and often a single outlay would be made to suffice for many libraries, as for instance in a combined catalogue, which could be made to answer for all the libraries.

There is no greater apparent waste of money in libraries than that spent both on cataloguing and on the printing of catalogues, and yet no library can fulfil its proper functions without a catalogue, and many libraries must have a printed one. It is often urged that there should be a community of endeavor in this respect among libraries. Among large libraries this is impossible, inasmuch as so small a portion of their accessions are in common. If one doubts this, look at the printed lists of their yearly accessions published by such contiguous libraries as the Boston Public Library, the Boston Athenæum, and the library of Harvard University. One will be surprised at the comparatively few titles common to the three lists. But as respects the ordinary free town library no such difficulty exists. A library of 5,000 to 10,000 volumes is in no wise hurt if it is made the duplicate of a hundred others. There will be the same standard English books and the same selection of current publications. To serve a circle of such libraries with the same cataloguing, printing, and supplies of all sorts, with the advantage of a single supervising mind, means a diminution of expense for each library of at least one-half, or, in other words, a doubling of facilities for the same money.

Unfortunately it involves a sacrifice of local independence, which communities at present do not think preserved at too great cost when the expense is doubled. To make the needed economic changes, the village lawyer, doctor, and minister who make the committee to select books, must give up their function, the schoolmaster must forego a pittance of addition to his income for the cataloguing of the books, the carpenter must consent that a distant mechanic shall make the cases, and the country printer must find other profit than in printing its blanks and catalogues. The interests of these people, added to the general belief in what is called local independence, have thus far, in America as in England, militated against the first principles of thrifty management for such libraries. The coöperation which has come about in trade and in such institutions as the Army and Navy stores of London, shows what the future will develop in this other field; and when we in America find our population sufficiently congested, and the getting the utmost out of money a necessity, we shall then wonder why France has so long seen and acted upon what we have so long stubbornly refused to recognize. JUSTIN WINSOR.

THE OUTLOOK IN IRELAND.

LONDON, January 17, 1891.

THE comments of the *Nation* upon the Kilkenny election were singularly perspicacious, recognizing it as the first Irish election whose result would seriously influence the fortunes of the country. Indeed, we may say that now, for the first time in Irish history, the Irish people have their fate practically in their own hands. If they pronounce unequivocally against Mr. Parnell, the self-government of Ireland cannot be much longer delayed. If their decision be doubtful or largely in his favor, a dreary time of hope deferred opens out before us.

At the present writing, affairs do not look particularly encouraging. I lately spent a month in Dublin, where feeling is strong in favor of Mr. Parnell. I was assured by a lady who had seen some of the chief Dublin gatherings of recent years, that the Rotunda welcome meeting surpassed all others in sustained enthusiasm. Literally for twelve minutes Mr. Parnell was kept bowing on the platform before being permitted to speak. That he should be so regarded by the masses is not very wonderful, but what is truly so is the firm hold he retains on the hearts and minds of the refined and educated. The Protestant Home-Rule Association, constituted essentially of educated and thoughtful men, after a fortnight for reflection, and after a fair and well-sustained debate, pronounced in the proportion of nine to five in his favor. So with most of my Nationalist relatives and friends, male and female. They say: "We have no right to be too hard on Mr. Parnell." "We have not yet heard his side of the story." "He is the only man qualified to lead us." "Mr. Gladstone is not to be trusted, nor is the English Liberal party." Among less intelligent, but excellent people, one hears: "It is most likely he is not guilty at all; it may be a conspiracy of the Government." The extent to which refined and cultivated women, both in Ireland and here, have espoused his cause, is a problem. He has been welcomed in respectable Dublin and Cork homes as he was never before welcomed. "Oh, I am with you, but my wife here is for Parnell," said a Catholic friend whom I met out walking with his wife. Some quite historic names among London women are on his side. Also he has the adherence, more or less, of a large class of well-known men, such as O'Neill Daunt, John O'Leary, Barry O'Brien, and others, who had hitherto held back from too much identifying themselves with the Parnell movement. That they should now clasp hands with the "Hillside men" is remarkable. It may be partly explained by their never having been really converted to the British alliance. These men, as well as the women referred to, can perhaps take a more personal and unpractical view of the situation than those burdened by the responsibility of public matters.

I had occasion to visit in the country an old friend, who had for nearly twenty-nine years formed a part of my own household. Her family, occupying a mud-built cabin in the County Kildare, are respectable tenants, sustaining themselves honestly by hard labor, assisted by her savings. They expressed themselves almost fiercely, as far as courtesy to me permitted, in favor of Parnell, dwelling especially on our "ingratitude" to him. I could see that my defection was a grief to them. The gentleman farmer, the landlord under whom they lived, shared their views. Sitting in his comfortable dining-room, he exclaimed: "The big landlords would have sold the eyes out of our heads, and this man saved us, and now you turn against him." His wife expressed herself even more strongly. The openness with which all these people, Catholics, reprobated the action of their priests, was very striking, and shows how the Irish people, except in ecclesiastical matters, have emancipated themselves from clerical control. On the other hand, a young curate, with whom I conversed on the subject out of doors, spoke under his breath so as not to be overheard in adjacent cabins. I was disappointed that some tenant farmers, asked to meet me at the house of the parish priest, were disinclined to express their real sentiments in his presence. The talk was sustained almost entirely by him, the landlord aforesaid, and myself. The inevitably demoralizing effect on the community of a condonation of Mr. Parnell's doings was emphasized to me the other day by hearing the comment of a Catholic servant girl thereupon: "After all, he is only in the fashion; sure, it's what the aristocracy do."

Against these my experiences in Dublin and the near country may be set the highly satisfactory result of the Kilkenny election. There is hope that while the towns and the portions of the country (such as Kildare) in sympathy with the towns may side with Parnell, the country districts generally are sound. Cork city, and certainly its Nationalist daily papers, are decidedly with us. The Wexford *People*, one of the most influential papers in the southeast of Ireland, also stands firm. The principal Waterford newspaper supports Parnell. The vehement and constant advocacy of the *Freeman's Journal* is one of the strongest factors on his side. To be without a central leading organ to express their views is a difficult and humiliating position for the majority of the Irish Parliamentary party, who believe they represent an overwhelming preponderance of the public opinion of the country. The *Insuppressible*, a cleavage in our interest of *United Ireland* seized by Parnell, is a poor stopgap. Funds are being raised for the establishment of a first-class Dublin daily organ; but every one knowing what that involves will understand that it could not be started at once.

Looking at affairs altogether, and even considering the Kilkenny election (an election conducted on the whole in a manner so creditable to our people, and which did not prevent the Judge of Assize there being since

presented with a pair of white gloves), we fear the situation has not improved within the past month. Mr. Parnell has shown steady and persistent energy and determination, combined with the skill of a Mephistopheles, in confusing the issue and beguiling even the best. No such energy has been manifested by his opponents. Relying on their majority in committee-room No. 15, they can display no such front as his. The strong personality of Parnell is much in his favor. Even the English Liberal papers notice his speeches more than those of the anti-Parnellite members. Mr. Healy is the life and soul of the opposition; but his effectiveness has been sadly marred by ill-considered abuse of those from whom he differs, and public statements which cannot always be substantiated. The personal accusations on both sides have been shocking, calling in question chiefly motives as against the Opposition, and character as against the Parnellites. I had an opportunity of investigating some of these latter accusations, and found them as baseless as are the aspersions cast on the motives of Mr. McCarthy and his friends. The very designation Parnellite has in itself a prestige not associated with that of McCarthyite. The *Pall Mall* term "Patriots" assumes too much, and does not find general acceptance. The wild utterances indulged in by Mr. Parnell before and during the Kilkenny election were entirely unlike his old self. This was especially impressed on me lately in looking over a scarce book prepared for the Commission—Mr. Parnell's 'Speeches, Letters, and Public Utterances out of Parliament from 1879 to 1888.' He has now reverted to his former and more really telling style.

The return of Mr. Harrington, his vigorous resumption of the management of the National League in his leader's interest, and personal advocacy of his cause over Ireland, immensely increase Mr. Parnell's chances of success. Worse than all are the return of Mr. O'Brien, the Boulogne conferences, the opening he has left for the supposition that he has been captured by Mr. Parnell, and the consequent numbness among the Opposition over the cause of Ireland, while Mr. Parnell has felt encouraged to pursue his course with unabated energy. And now it is supposed we are to await John Dillon's return before knowing our position. Dillon and O'Brien have hitherto acted in unison. If Parnell's benumbing spell should be thrown over Dillon as it seems to have been over O'Brien, the Irish cause would apparently be ruined, for the present at least. Without Parnell, reunion would be possible; with him, now or in future, impossible. There appears little prospect of his retirement in the hints that reach us of an understanding between him and O'Brien, only awaiting Dillon's return to take form. If the expenses, recriminations, and violence attendant on the Kilkenny election be any augury of what would occur in contests between Parnell and the country party over Ireland in a general election, many of the present National members would decline to stand, and the personnel of the party would be greatly changed.

Meanwhile, Ireland, for the hundredth time in her history, is to all appearances on the dissecting table. Unless union and the consequent American and Australian help be secured, it is doubtful whether the tenants' combination can be sustained for many days or weeks. And again over wide districts famine stares us in the face. We cannot question the motives of the Lord Lieutenant and Chief Secretary in appealing for aid, nor the wisdom under the circumstances of the means by which they propose to investigate and alleviate distress. Combined with grants for public works and railways, never was there a more energetic effort to combat distress in Ireland. But what a mortification to Irishmen, to have the management of their own affairs withheld from them, and then to have their miseries—the outcome, they believe, of misgovernment and that deprivation of rights—exposed to the world's inspection and commiseration. And what a commentary it all is on the attitude hitherto maintained by Mr. Balfour and his adherents towards the coerced, evicted, and harried Irish cottiers. Having with consummate ability beaten down and wearied out resistance, having swept some into prison, and the strongest opponents, O'Brien and Dillon, into exile (Parnell meanwhile playing his game), Balfour now believes himself master of the situation, and, as a beneficent deliverer, appeals for charity (which flows in abundantly from his friends), opens soup kitchens and public works in the west, and a depot for old clothes in Dublin Castle. If through all this the National cause survive, its vitality will indeed be proved. Apart from the treachery of Mr. Parnell, the home-rule cause has comparatively less force in Ireland than it had a few years ago when practically it had the field to itself. The "labor" question is now, under the ægis of Mr. Davitt and his *Labor World*, beginning to claim a large share of the attention of the operatives in the towns, and other tests than those of nationality and land reform are increasingly being applied to those willing to represent the people on local boards and in Parliament. The immediate appreciation that took place in many Irish securities after the proceedings in the divorce court, cannot be otherwise accounted for than as arising from the increased confidence of the capitalist classes in the commercial prosperity of the country consequent on the lessened chance of establishing a government in consonance with the wishes of the masses of the population. D. B.

DECORATION DAY IN JAPAN.

SENDAI, Japan, December 2, 1890.

As it is a popular notion that in many habits and customs the Japanese are directly opposite to the people of the West, it is interesting to observe how they keep green and fresh the memory of those who died in battle for their country. Up to the seventeenth century, when the Tokugawa Shoguns assumed control, Japan was a vast battle-field. The powerful families were at continual war with each other, and private feuds raged incessantly. There is a tendency at present among some to underestimate the beneficent work of the Shogunate, but, whatever else may be said for this dynasty, it put a stop to the terrible bloodshed, and gave the country profound peace for more than two centuries. Up to the events leading to the restoration in 1868, a maimed man was a rare sight.

To place the Emperor (Mikado), however, in the position of real as well as nominal head—a position which he occupied in primitive ages—it was necessary to use force, and again Japanese fought their brothers. In the contest that followed, many thousands were killed in the struggle from the Hokkaido (Yezo) to the southern end of Hondo, the main island. Later, when the reaction against the progressive notions broke out in Kiushiu, the most southern of the four main islands, again the country suffered the loss of some of the most loyal. To extinguish this last expiring blaze of feudalism cost several thousand lives. But since this rebellion in 1876–'77 there has been no serious conflict either without or within. As under the Tokugawas, tranquillity and quiet are spread over the land. Nevertheless the feeling of patriotism may be all the stronger. The devotion and loyalty of Japanese retainers to their lord have become well known. Now the country stands in the stead of the daimio, and martial patriotism treasures the past.

The celebration in honor of the gallant dead occurs at different dates in different parts of the empire. Here in Sendai it falls on November 23. The occasion is, of course, not observed with equal ceremony in all places. But in this city it is the chief of the eleven national holidays of the year, owing probably to the fact that there is a garrison of some five or six thousand soldiers here. These are very active in preparing for the event.

Sendai is a city of some seventy-five thousand inhabitants, but only a few hundred soldiers are buried here. As a fact, not one of the bodies rests here, but only the ashes, or some of the hair cut from the top of the head. Many of these remains of the dead rest in a solemn grove of dark, towering cedars, near a large and imposing temple, at the top of a high hill overlooking the town. It is almost inaccessibly situated across a rapid stream without a bridge. In the dim solitude of these tall trees there is the calmness and stillness of the heart of a primitive forest, though the centre of a large city is within ten minutes' walk. Other of the dead are in cemeteries around the city.

Several days before the date of this festival, committees are appointed to secure subscriptions from the merchants, business-men, and citizens generally. Usually this is managed by the union of all those along a certain street or in a certain quarter for a definite purpose. This year some combined to employ the band and others to provide the dancers, jugglers, and actors. The military element looked after the temporary temple and the horse races. The railroads, two in number, also contributed towards the expenses, and also got their share of the gains by cheapening the rates.

The occasion was utilized in a legitimate way by merchants and business-men to "turn an honest penny," and it is generally seized by the public as a time of universal holiday joyousness. There is no regular day of rest here as in the West, and these festivals are the only periods of cessation from toil on the part of the masses. What with the visitors brought by the railroads from points near by, farmers from the surrounding country, and the laborers taking a day of rest, the streets were thronged with an enormous crowd.

Before every house and over every shop waved a national flag, an emblem of simple but appropriate design—a solid red circle in a white field. It symbolizes the sun rising from the bosom of the Pacific, and typifies Japan's position as having an unobstructed view of the coming orb of day. With the wonderful appreciation of nature and fine taste which these people have, flowers and plants and evergreens were used in profusion for decorative purposes. Rare and valuable old screens were drawn from their hiding-places and stood in the front part of the shops, that all might see and admire. This disposition of these treasures cannot be appreciated without understanding that the first floor of all Japanese houses is less than two feet from the ground, and that the entire front wall consists of sliding doors which are removed during the day, thus giving one from the street a full view of everything within. It must also be remembered that the depth of the majority of the shops is less than twenty feet from the edge of the street. The streets are also very narrow,

the entire width from house to house not being much greater than double a single sidewalk in New York. Of course, there is no sidewalk or separate way for foot-passengers here; carriages, pedestrians, and animals all being mixed together in one roadway.

Along these narrow ways for two days a closely packed stream of people pressed and swayed, but all the time with the utmost good humor and light-heartedness. The costumes of the elders were dark and unvaried, but, with the children in their best robes, colors ran riot, and brightness and gorgeousness poured ceaselessly by. Every child was out to see the sights, no one being kept at home to "mind the baby." The smallest infant was strapped to the back of its elder brother or sister, and, safe on this perch, could roll its head from side to side, and peep over the shoulders in front and laugh and crow at the crowd around. The Japanese mother is very practical, and cares nothing for appearances if only the children are not lost in this multitude Those next above the youngest, that can just walk, are tied around the waist with a long sash or cord, and are led all through the pressing numbers.

Especially around the *dashi* ("floats," or triumphal cars) do the children swarm. These *dashi* are very curious structures of a slender and perilous height. They are slightly made of bamboo and small timbers and light canvas. Their foundation is a very elaborate framework rendered very heavy by the intricacy and number of the pieces and joints. Above this the top towers some thirty or more feet, resting on small airy supports. The entire length is some fifteen feet, while the width is seven or eight. It was built to contain a representation of the ancient Court of the Emperor. Several figures of life size, either carved or made of plaster, and dressed in the old style, were standing on it. As befitted such an occasion, Japanese history had been drawn upon, and the scene was intended to appeal to the sentiments of courage and patriotism.

In one of the *dashi* was a hero of a thousand years ago, a member of the powerful Minamoto family, receiving the commission from his emperor to exterminate a nest of devils. They were known as *Oni*, their home was hell, and their work the torturing of men after death. In another *dashi* a real historical incident was illustrated. About a thousand years ago, all this northern part of Japan was subdued by a brave warrior named Ahe. So extensive was his dominion that he defied the Emperor. The *dashi* shows a vassal, Yoshiiyé, receiving instructions to reduce this defiant subject in the north. As may be inferred from the use of this incident at this ceremony, the faithful lieutenant is entirely successful.

These ponderous floats are slowly borne on the shoulders of thirty or forty men from point to point along the main streets. The bearers are dressed in coarse yellow garments fantastically ornamented with some Chinese characters. Amid the excitement of the multitude and the loud shouts of the bearers, this creaking, swaying mass is carried a few feet and deposited for a breathing spell. In this laborious manner it is transported up and down the street during the day. Another point of attraction for the crowd is a movable platform for the girl dancers. These are naturally decked out in all magnificence, and perform whenever the car is not in motion. It is hardly dancing as we understand that exercise, but is more accurately described as posturing.

But it is on the outskirts of the city that the central feature of this ceremony is witnessed. Here is placed the garrison, on the site of the dismantled old castle of feudal times. In front is a wide, gently sloping plain. On this space were the race-course, platforms for dancers and for jugglers, booths, stalls, shows, exhibitions, statues of heroic size showing the triumph of bravery in the face of danger and death, monumental mounds, triumphal arches, and the sacred temple specially built for this occasion. There is no long procession and strewing of flowers on the graves. The remains of the soldiers are laid away in an inconvenient spot, but the celebration in memory of them can be observed in spirit anywhere; so the most convenient place for the assembling of the people and for the military is chosen near the barracks.

At one end of this open ground a temple is lightly erected, and tastefully hung with numerous flags and hundreds of lanterns, and prettily decorated with flowers and plants. At the further end is a small shrine of clean white and unpainted wood, with the altar and two or three steps leading up to it. In front a broad walk with a row of lamps on either side leads down towards the entrance to the barracks. At the temple is a magnificent high evergreen arch; at the end near the garrison gate is an evergreen *torii* (gateway).

In accordance with what seems to be a generally observed custom here of beginning everything as early as possible, the formal ceremony for the valiant men in their graves was to come off almost at sunrise. The exercises were very simple, solemn, and impressive. Before sunrise, military officers and civil officials began to assemble at the temple. When a sufficient number had gathered inside, a Shinto priest opened the ceremonies with the reading of a eulogy, at the signal given by the firing of a gun in the garrison. This occupied only a few minutes, and at the close of his address he laid some offerings of fruit and flowers on the altar. Then, one by one, the guests, in the order of their rank, went forward and paid their respects to the spirits of their comrades by bowing before the shrine. There was also some music by a military brass band. All who wished were at liberty to make offerings, and, after the general public was admitted, numerous gifts, chiefly of fish, fruit, game, and meat, were piled on and about the altar. An especially popular present was *mochi*, or rice cake, a peculiar kind of blue and white cake generally used on festival days. Although the crowds were afterwards allowed to walk in, the utmost decorum and quiet prevailed. There was no railing or barrier of any kind to keep out the inquisitive from handling the offerings and intruding upon the shrine, yet not even the children transgressed the sanctity of the forbidden limits. As if in full keeping with the *spiritual* character of the entire celebration, only a small cord laid on the ground to mark the limits for visitors, was needed to hold the sightseers in check. Not a single policeman was required to guard this holy place. In general the crowd for the two days was a marvel of order and quiet—no drinking, no boisterousness, no rowdyism.

Correspondence.

THE SILVER BILL AND THE FARM MORTGAGE.

To the Editor of The Nation:

Sir: The western boundary of St. Croix County, Wis., is but twenty miles from St. Paul, Minn. A local money-lender, representing New England savings banks, estimates the mortgaged acres at from 35 to 40 per cent. of the whole county. A local banker, representing private individuals in the East, thinks nearly half the farms of the county are mortgaged. Both agree that all the loans of which they have any knowledge are not payable in gold, but in "lawful money of the United States." I am familiar with the condition of the farmers in the famous Fox River dairy district of northern Illinois—a region where mortgages are not unknown—and never knew of a loan payable in gold there. These local instances lead me to think that Mr. Smith, in No. 1333, makes too high an estimate in saying that 75 per cent. of the mortgage indebtedness of the country is payable in gold. The gold-paying clause is more common in urban than in farm loans, and in the latter class more common in the new States west of the Mississippi than east of it, for in these the large loaning companies operate but little.

I wish, also, to demur to the manner in which the same correspondent refers to all men, and especially the mortgaged farmers, who favor the free coinage of silver, as knowingly and wilfully aiming to perpetrate a fraud. It is an easy thing to say "honest" granger, but that it is just I doubt. No one can live among farmers and see them battle, as most farmers have for the last decade, with the tremendous odds of lower and lower prices for all they had to sell, of failing crops, and, as a consequence, declining values of real estate, without knowing that, as the world goes, farmers are honest men. Their very existence, everything that they hold dear—the comforts of the family, home, all that appeals to man, even a city man—appeals to them to save, if they possibly can, the homestead, on which, perhaps, the best energies of their strongest manhood have been expended. They love the farm. It is a part of their very selves.

It is cold comfort to be told, as Senator Spooner (and this county is his home) told the Senate last winter, that he believed a mortgage was a "good thing" and a "sign of prosperity." The mortgage of prosperity does exist truly enough. It was in prosperity that many a farm mortgage was born. They can now be found on lots in every growing, booming city in the country, from Chicago down to the small capital that springs up where two railways cross. But it is the mortgage of adversity, I am forced to believe, that has been assumed or renewed by farmers so generally during the last ten years. Hoping against hope, every springtime they have planted, every autumn they have harvested, and again it has been good crops and no prices, or fair prices and no crops. Harassed on their downward way by tariffs that have risen

> . . . . "on stepping-stones
> Of their dead selves to higher things,"

they go on until they waken some morning to the fact that the interest alone on their mortgages exceeds the rental of equally good farms. They cannot sell their land for the indebtedness against it. Hopelessly bankrupt, they appeal to the holders of the loans for a scaling down of the indebtedness, for a lowering of the interest, and are met with insistence on the last penny named in the bond, or—the land.

It is a suffering, and, as they believe, a wronged people, who are crying for Government intervention, Governmental control of the railways, warehouses for crops, abolition of national banks, and the free coinage of silver. That they are mistaken and wrongly

advised, such books as Wells's 'Recent Economic Changes' and such articles as those of C. Wood Davis in recent issues of the *Forum* help us to understand. That they are dishonest and hope to pay their indebtedness in cheap money, cannot be seriously entertained. Rather is it their belief that the low prices of farm products result from a contracted currency which supposititious "gold-bug millionaires" of the East control for their own good pleasure, and that more currency will somehow restore the high prices of former years, and in that way enable them to pay justly and honestly all they owe.

It should not be forgotten that the decline in land values has wrought throughout the agricultural realm as much suffering as the present severe weather in Europe, only it is not so sure of relief. And it has been brought about by agencies that could no more be foreseen and prepared against than could the semi-naked citizen of Naples foresee and prepare against his unexpected visitation of snow. Conceive the wild uproar that would be raised if real-estate values in New York should decline year after year 10, 15, 25, 50 per cent. The people who are complaining now would make ten New Yorks, and their voice is but a gentle murmur compared to the Niagara that would burst forth from our city friends were they but called upon to endure a similar experience. —Respectfully, THEODORE JESSUP.

BALDWIN, WIS., January 23, 1891.

THE SILVER BILL AND THE PENSIONERS.

TO THE EDITOR OF THE NATION:

SIR: In the discussion of the silver question and of the interests which may be affected by the substitution of silver for gold as the standard of value, no reference has been made to the scaling of pensions which must result from the threatened legislation and the consequent payment in depreciated coin. To readers of the *Nation*, this proposition requires no demonstration, but the thought may be new to many, that an organized body of voters exists—one especially powerful in Western States—which may be relied upon to resist the proposed change in value to the uttermost.

The pensioners of the nation form the largest "creditor class" that was ever legislated against, and, known as the Grand Army of the Republic, it inspires immense respect where Wall Street opinion would not have much influence. No body of men is so much interested. They have passed the years when a new income can be secured to replace one lost or reduced, and they have relied upon the nation's keeping its promises to pay in spirit as well as in letter. Having supposed their comfort assured in old age and decrepitude, they will not see this security removed without most vigorous resistance, and the politician who advocates the reduction of pensions by giving seventy-five cents where a dollar was promised, will shortly require a pension himself, unless he be the owner of a silver mine.

Assuming the President's veto of the bill which passed the Senate, all believers in honest payment of debts and in sound finance ought to unite in measures designed to enlighten the great body of voters who now receive pensions, or who seek them under existing laws, as to the effect upon them of the threatened free coinage of silver. W. B. T.

CINCINNATI.

MORAL EFFECTS OF A HIGH TARIFF.

TO THE EDITOR OF THE NATION:

SIR: One of the moral effects of a high tariff is well illustrated by two incidents given me by good authority.

(1.) A certain manufacturer placed on the market a high grade of covered buttons, which sold at a less cost than many firms would make them for for the wholesale trade. Careful search discovered that the foreign agent of the manufacturer purchased silks, velvets, etc., on which was a high duty, and, by cutting the bolts of cloth through with a chisel, passed the goods through the custom-house as damaged. The material was of as much practical use as if intact. (2.) On fine gun-barrels (brought chiefly from Germany) was a considerable duty. By leaving the exterior but partly finished they were imported as iron *tubes*, bearing no duty.—Respectfully,

A. C. N.

WORCESTER, January 20, 1891.

FROM AN OLD FUR-TRADER.

TO THE EDITOR OF THE NATION:

SIR: The late William Sturgis of Boston, who spent some years of his early life on the northwest coast of America, as a successful fur-trader with the Indians, said in later life: "I may well be grateful that no blood of the red man ever stained my hands; that no shades of murdered or slaughtered Indians disturb my repose. And the reflection that neither myself nor any one under my command ever did or suffered violence or outrage during years of intercourse with those reputed the most savage tribes, gives me a satisfaction in exchange for which wealth and honors would be as dust in the balance."

I send you this quotation with the hope that some of the men who are now responsible for our Indian affairs may read it, and at least wish that they could say as much. E. W. H.

CAMBRIDGE, January 25, 1891.

WASHINGTON'S PIETY.

TO THE EDITOR OF THE NATION:

SIR: The enclosed abstract from an old book in my possession may have interest for the readers of Mr. Moncure D. Conway's letter in the *Nation* of December 11, 1890. Other parts of the book indicate the author's personal dislike to Gen. Washington, and want of respect for the religious observances of that day. He seems to tell the truth as he understood it, but may not have comprehended all he saw and heard, as was the case with the French gentleman he describes who was invited to five o'clock tea at Bath, where the guests sat around the room in a stiff circle, holding their tea-cups in their left hand and eating hot buttered waffles and chipped smoked venison with the fingers of their right, from plates in their laps. Waiters handed about tea and coffee, and the French gentleman, unaware that the position of the teaspoon in the empty cup returned to the waiter indicated whether or not it was to be replenished, politely drank fourteen cups of tea, and then in despair pocketed the cup and saucer, until the general rising of the company enabled him to rid himself of them.

The book is not altogether pleasant reading for patriotic Virginians, but, judged by recollections going back forty years, and a personal knowledge of the section described, tells, in the main, the truth, as far as I have read it. Very truly yours, P. L.

CUMBERLAND, MD., January 20, 1891.

"Nous étions chez Md. Throkmorthon, parente du général Washington. Cette bonne Américaine, par un désintéressement peu ordinaire aux personnes qui tiennent des pensions, fit assez mal ses affaires. Son cousin, du haut de la grandeur où la partialité et quelques services l'ont placé, semble ne pas appercevoir ceux de ces parents que la médiocrité entoure. Je lui demandai si son illustre allié était autant pénétré de l'importance des formes religieuses qu'il semble l'être par l'exactitude scrupuleuse qu'il met à les observer. Elle me dit qu'elle le croyait de bonne foi, qu'à la mort du père de Washington, qui était déïste, le fils devint très religieux. Ce grand homme fait ses prières avec la régularité d'un moine, et va tous les dimanches à l'église édifier ses concitoyens par son recueillement et sa ferveur angélique. Chez un peuple dévot, cette conduite n'a pas besoin de commentaire." (*Voyage dans l'intérieur des États-Unis, à Bath, Winchester, dans la Vallée de Shenandoha, etc., pendant l'été de 1791, par Ferdinand M. Bayard.* Paris, 1797. P. 85).

DISPOSITION OF THE RECEIPTS OF THE PASSION PLAY.

TO THE EDITOR OF THE NATION:

SIR: During the past season there were in circulation many unfavorable reports in regard to the Oberammergau Passion Play. The press, both in this country and in England, abounded in statements like the following: That the play had degenerated into a money-making affair, had fallen into the hands of the Jews, who had advanced the necessary funds for its production and would appropriate the greater portion of the profits, while the villagers themselves, no longer actuated by the pious motives of their ancestors, were now seeking rather to enrich themselves than to carry out in a religious spirit the vow of 1633. The ecclesiastical authorities, it was said, now regarded the performance with coldness, if not with absolute disfavor, and were certain to prevent its continuance ten years hence.

It was the privilege of the writer to see the "Passion Play" for the first time in 1860, and he has ever since followed it with unabated interest. Although well aware of the utter falsity of the above statements, he has preferred not to contradict them publicly until the official account of the receipts and expenses should have been published. This has now been done, and it has occurred to him that the great number of his fellow-countrymen who attended the wonderful performances of 1890, might be interested in their material results.

The following statement is signed and published by the Bürgermeister of Oberammergau, who will be remembered as the *Caiaphas* of the play. It should be stated that the reckoning is in German marks.

RECEIPTS.

1. Received from tickets of admission	665,719.50
2. Received from the sale of photographs	27,000.00
3. Received from other sources	2,004.57
	694,724.07

EXPENDITURES.

1. Interest on acquired funds	$6,527.60
2. Building expenses, including material	199,668.85
3. Paid those assisting in the play	242,830.00
4. Distributed to 238 householders, 180 M each	42,840.00
5. Distributed to 29 families, 100 M each	2,900.00
6. Applied to communal purposes, as follows: For building a new hospital; sewers; water supply; roads; protection of the river banks; fire engines; relief of soldiers, of the poor, etc.	99,397.00
7. Reserved for other communal purposes, as follows: Towards a fund for the hospital; for the purchase of articles necessary for the church; for the poor fund; for the increase of teachers' salaries; protection of the river banks; public lands; technical education; extension of the system of canals, etc.	100,000.00
Reserve	560.61
	694,724.07

From the above it will be seen that about $61,000 American money was the sum divided among those taking part in the production of the play, the amount being slightly less than half the net receipts. Those thus paid were 747 in number, and they assisted at 40 or more representations, each of which occupied an entire day. Mayer, the leading character, received $500; the manager, music-director, lead-

er of the chorus, and chief cashier, $325 each; while the actors were allotted sums varying from $225 to $37.50 apiece, the 269 children being divided into two classes, and paid, respectively, $20 and $10. The greater portion of what remained was divided between public charities and village improvements.

This disposes of the question of personal profit. The writer may add that he found in 1890 the same play and a people similar to the one he remembered in 1860, all actuated by the single desire of fulfilling the vow of the fathers and serving the cause of religion. The Church authorities have never ceased to extend to the Passion Play their entire approval, and Joseph Mayer stated that the question of its continuance had never been raised.

H. D.

Boston, January, 1891.

A FORGOTTEN NEW ENGLANDER?

To the Editor of The Nation:

Sir: Can any of your readers tell me anything of one N. Orchard, alleged to have been a New England preacher in the seventeenth century? He well deserves remembering. In 1676 there was "printed for the author" at London an anonymous book bearing this title: 'The Doctrine of Devils, proved to be the grand Apostacy of these later Times. An Essay tending to rectifie those Undue Notions and Apprehensions Men have about Dæmons and Evil Spirits.' It was a passionate attack upon the belief in witchcraft, which it declared "a bloody, barbarous, cruel, and murtherous opinion, an opinion that butchers up men and women without fear or witt [*sic*], sense or reason, care or conscience, by droves." The book attracted notice, and the defenders of the superstition, as Glanvil, gave space to its refutation; but they knew nothing of its authorship, and English bibliographers, down to Halkett and Laing and the British Museum catalogue, seem ever since to have shared their ignorance. In 1687 the Huguenot pastor Benjamin Daillon, then a refugee on English soil, translated it into French (at least, one of the four papers making up the volume published for him that year in Amsterdam bears precisely this title), but, so far as I can learn, without naming its author. In 1691, however, there appeared at Amsterdam a Dutch version, on whose title-page there were added to the translated English title these words: "In 't Engelsch geschreeven door N. Orchard, Predikant in Nieuw-Engeland. En volgens de Copy gedrukt tot Londen in 't Jaar 1676 vertaald door Wm. Sewel."

It was in that very year, and in that city, that there saw the light the epoch-making work of Balthasar Bekker—that 'Betoverde Weereld' which dealt a death-blow to the whole ecclesiastical theory of the devil. Orchard had anticipated many of Bekker's conclusions, and in the war of pamphlets which followed he came in for his full share of attack; but his Dutch adversaries, though they never questioned Sewel's ascription of the book to him, seem, like his English ones, to have known nothing more of him than the title-page told them. His Dutch translator, indeed, tells us nothing further, either of the author or of himself. The only addition which I can find him anywhere else to have made to his English original is a brief note, signed by him, to a passage of Orchard's preface, defending the Quakers against an aspersion of that author. But this is quite enough for William Sewel's identification: he was clearly the eminent Quaker historian so named—who was, as is well known, a resident of Amsterdam, and translated more than one English book into Dutch. And it is not less clear that Orchard was not of that faith.

But who was he? I find naught of him in Savage. The "N." may mean only that Sewel did not know his forename; and Orchard may be a variant for Archard or Archer; but this does not help. In his book itself not a word, either in preface or in text, suggests a New England authorship. Nay, there are many passages—as where he tells us how "in the last troubles we had informations (that went all the Kingdom over) from diurnals and other more credible testimonies, that our Northern zealots of Scotland butchered up many hundreds (I am ashamed to write the exact number because it is so monstrous) in a very short time more than there had been of all other sorts of criminals in fifty years before, upon the conceit of this guilt"—that could hardly have been written otherwhere than in England. But Sewel's phrase might still be true, if Orchard emigrated to New England later than the publication of his book. If at any time during the decade or two before the Salem panic there dwelt on this side the Atlantic so fiery a foe of the witch-persecution, it is well worth the knowing; for it adds one more fact to the evidence from which men will one day learn how, in our eagerness to clear our fathers by making their age their accomplice, we have done sore injustice to a multitude of thoughtful and kindly men who everywhere, and from first to last, stood against their bigotry.

Geo. L. Burr.

The President White Library,
Cornell University, January 16, 1891.

Notes.

Henry Holt & Co. will soon issue a series of brief burlesque ghost-stories, called 'Told after Supper,' by Jerome K. Jerome. The volume will be humorously illustrated.

Mr. Theodore Roosevelt's 'New York,' in Prof. Freeman's "Historic Towns" series, will be published at once by Longmans, Green & Co.

The second volume of the American translation of Sybel's 'History of the Founding of the German Empire,' which brings the narrative down to 1863, is announced as nearly ready by T. Y. Crowell & Co.

Macmillan & Co. promise shortly the 'Life of the Right Honorable Arthur McMurrough Kavanagh,' a country gentleman, landlord, M. P., and sportsman, born without arms or legs.

'Days of My Years,' reminiscences by the Rev. Joseph Cross, D.D., who tells of the early days of Methodism, and of the late war; and 'Thoughts on Life, Death, and Immortality,' selected from the unpublished writings of the late Bishop of Michigan, Dr. Harris, are in the press of Thomas Whittaker.

Benj. R. Tucker, Boston, is about to bring out a translation, direct from the author's manuscript, of Count Tolstoi's 'Church and State,' an assault on both from the Christian standpoint.

D. Lothrop Co. have in preparation a new four-volume edition of the 'Arabian Nights,' with an elaborate introduction by the Rev. W. E. Griffis.

The Shakspere Society of New York invites subscriptions to a four-text edition of "Hamlet," consisting of the three versions of 1603, 1604, 1623, reproduced with absolute fidelity, and a translation of a German version performed in Dresden in 1626, "which throws a curious historical light upon the actual stage reading of the tragedy as presented by the London actors." The edition will be confined to 150 copies, and will be *de luxe*. The clerk of the Publication Committee is Mr. L. L. Lawrence, 21 Park Row, New York.

There is little to remark on the sixth volume of the new edition of 'Chambers's Encyclopædia' (Philadelphia: J. B. Lippincott Co.). It ranges from Humber to Malta, two termini suggestive of the British dominions, which are, in fact, illustrated copiously in the articles India, Ireland, and London. On the other hand, of the dozen maps, eight are of States of the American Union. Something, nevertheless, might be said of disproportions and omissions in the American department, and as an example we will cite the article devoted to the publisher, Frank Leslie, while the pioneer abolitionist, Benjamin Lundy, is overlooked. "Jerrymander" is inserted without mention of the true spelling, though with a reference to Gerry in a previous volume; but there the reader is not warned that the G is hard. Italy is one of the longer articles, and there are two maps of the peninsula, ancient and modern.

"Treasure-house of Tales" is the comprehensive title devised for four attractive-looking volumes which come to us in a box from J. B. Lippincott Co. The edition is of English make and origin, and the connection between the several authors is their English nationality and contemporaneousness in time. The time was that of the Annual, to patient grubbing in which we owe a considerable part of the present collection. Each volume has an etched portrait frontispiece which is hardly to be called an embellishment; and each is introduced with a biographical, or, as in the case of Mary Shelley, a critical sketch. Thus, the prefatory memoir to the 'Tales of Leigh Hunt now First Collected,' is by Prof. William Knight of St. Andrews. There are twenty-eight of these short stories. Mr. J. Logie Robertson is sponsor for 'The Tales of Douglas Jerrold, now First Collected'—eighteen in number—and for the twenty 'Tales and Sketches by Benjamin Disraeli'; Dr. Richard Garnett for the 'Tales and Stories by Mary Wollstonecraft Shelley, now First Collected'—seventeen all told. It is obvious that we have here a large variety of easy fiction for leisure moments, and altogether a very instructive phase of a notable epoch in English literature. On both accounts the series of reprints is to be commended.

Swan Sonnenschein & Co. publish in their Social Science Series 'Luxury,' by Émile de Laveleye. In spite of most expansive "leading," they are not able to fill out the required number of pages without adding another essay by the same writer upon "Law and Morals in Political Economy," to which no allusion is made on the title-page. Readers who may think this measure generous will, we fear, be disappointed, for nothing could be thinner than Prof. Laveleye's thought, and he scarcely condescends to serious argument. His style, however, is so graceful as to make reading effortless, and those who care to learn the author's opinions and prejudices may find some entertainment in these pages. There is a pleasant classical flavor about them, and the sentiments expressed are elevated and serene. The chapters upon political economy are made up chiefly of platitudes, but they are agreeably expressed.

Everything comes to him who waits—for low-priced classics as for other things; and no more striking exemplification of the proverb has occurred of late than the Messrs. Harper's six-volume popular edition of Boswell's Johnson, edited by Dr. George Birkbeck Hill. It is

a little less than four years ago that we sought at some length to do justice to this admirable performance, and we need not repeat ourselves. The present reissue is fit to adorn any library, public or private, and its price puts it within the reach of almost everybody.

In like manner, if not in like degree, the two volumes of the Marchioness of Dufferin's 'Our Viceregal Life in India,' which came under our notice a year ago, have been compressed typographically into one, for a "new and cheaper edition," which is supplied to the American market by Scribner & Welford. A graphic view of the India of to-day is thus made popular in price as it is sure to be in the appreciation of readers. Had an index been added, it would have been much more valuable.

Another bargain is the new and inexpensive issue, in a single volume, of the 'Biglow Papers' (Boston: Houghton, Mifflin & Co.). It is the good wine that needs no bush.

That invaluable annual, 'The Year's Art,' edited by Mr. Marcus B. Huish, and published in London by J. S. Virtue & Co., makes a prompt appearance for 1891. It is the repository of compact information concerning organizations and institutions of art, chiefly for Great Britain and her colonies, but with a section reserved for the United States. It takes note of the leading exhibitions, of which it gives small select pictorial memoranda after the fashion of illustrated catalogues. Its directory of artists is indispensable. Along with this the annual now gives from year to year portraits of members of one or other society. In the present volume we have those of the Associates of the Royal Society of Painters in Water Colors, including Walter Crane and Du Maurier among the best known names, together with four ladies, Mrs. Allingham, Miss Edith Martineau, Miss Clara Montalba, and Miss M. Harrison.

Scribner & Welford send us the sixth issue for the current year of 'Hazell's Annual,' which truly purports to be "a cyclopædic record of men and topics of the day," and what the Germans call a "Conversations-Lexikon." As will be inferred, unlike the almanacs, such as Whitaker's, its arrangement is alphabetical, which does not, however, interfere with the fullest interpolations, tabular and other, as one may see under the headings Commons, Peerage, Foreign Navies, Diplomatic, Privy Council, Ministries, etc. But the minor topics and the biographies of "men of the day" are the great features. Take, for example, the entry McKinley Tariff Act, '90, which refers to the articles United States, United States Political Parties, and Trade, and then quotes the comments of Gladstone, Sir Michael Hicks-Beach, and Lord Salisbury on the act and its effect, with ex-President Cleveland's condemnation of it; indicates the confusion it has caused in foreign trade and manufacture, and the enhancement of prices in this country, notices the defeat of McKinley for reëlection, etc. Beecher Stowe, Kipling, Positivism, Portuguese Political Parties, Early Closing Association, Country Holidays Fund, Obstruction (Parliamentary), Parnell, Harrison, Photography, Turf (The), World's Fair "(see Chicago Exhibition, and United States)," Missionary Societies, Nicaragua Ship Canal, Noms de Plume, are other samples of the range of this work; nor must we omit the very copious Obituary (Dec. '89 to Nov. '90), though it is classified and therefore put under several alphabets, or the "Occurrences during printing," which take in Koch's lymph, the O'Shea divorce case, or, finally, the valuable "Reference index to previous editions."

MM. G. Charpentier & Cie., Paris, are publishing a series of novels by eminent authors, intended primarily for the youth of both sexes, but worthy the attention of older readers. The first of the series is 'L'Abbé Roitelet,' by Ferdinand Fabre, a little literary gem, containing admirable descriptions of peaceful clerical life in the Cévennes. Calmette's 'Sœur Aînée' is the simple but dramatically told story of an elder sister's loving devotion; though the elder sister is in reality a cousin. Theuriet's 'Le Bracelet de Turquoise' is a brightly related episode in the life of a newly married couple, the flightiness of one leading the other into crime. The line between the *livre pour la jeunesse* and the regular French novel is rather lost sight of in this book. The fourth volume of the series is a romantic story, the scene of which is laid in Mexico, familiar ground to the readers of Lucien Biart, whose 'Le Bizco' is not greatly different from his other works. Outside of this Charpentier series is Jean de la Brète's 'Mon Oncle et mon Cu é,' one of the sprightliest, wittiest, and most enjoyable books published of late, abounding in Musset-like touches, and certain to interest old and young alike, though not particularly intended for the latter.

With its fifty-fourth volume the London *Publishers' Circular* is transformed into a weekly from a fortnightly, broadens from octavo to quarto, and gains such an appearance of alertness and promptitude as should come from turning over a new leaf. The editorial article referring to this change tells of the reorganization of the firm of Sampson Low, Marston & Co. by the withdrawal of Messrs. Searle and Rivington, leaving Mr. Edward Marston at the head of the new direction. The number before us, No. 1280, is largely occupied with the Copyright Bill now pending in the Senate, and with the conflicting views of British authors and publishers regarding its probable effects. In the opinion of the *Circular*, it "will stimulate authors of reputation to greater effort than ever," and will also spur "the youthful or unknown aspirant to put forth his latent powers."

The London *Bookseller* for January 9 gives the full text of our Copyright Bill, and notifies its readers that "as American books are, in the near future, likely to become of increased importance to the trade," it will in future give its American list in a separate division, with the American prices appended.

Our readers ought not to be kept in ignorance of a brilliant gem, well-nigh a "perfect chrysolite," of old-fashioned criticism, contributed by Mr. George Saintsbury to the London *Academy* of January 10: "The scene of 'Doctor Cameron' is American; and, from the use of the perfectly idiotic term 'blonde,' for a man, we presume the authorship is American also." "Perfectly idiotic," to characterize supposed Americanity, is good. Interestingly, moreover, does the tone of Mr. Saintsbury's inference exemplify, *pace* the shade of Darwin, the sporadic survival of the unfittest. As to *blonde*, who is to say that, as it is already largely Americanized, it may not, eventually, likewise be thoroughly Anglicized, as of all genders? Its precise analogue would be found in *naïve*, or, as it is now often written, *naive*. Even according to so late and so high an authority as Dr. Murray, it is only "commonly" that *blond* occurs, except where a fair woman is intended; and his article on the word is headed "Blond, blonde, *a.* and *sb.*"

The January *Portfolio* (Macmillan) starts the year well with a photogravure after the Velasquez newly acquired by the National Gallery. It is a full-length portrait of an obviously fighting character, Admiral Don Adrian Pulido-Pareja. The chief article of the number is the first of a series by the editor, Mr. Hamerton, on the present state of the fine arts in France. He remarks that the political overthrow of 1870 had less effect on the *matter* of art than any preceding revolution, and that French productivity in art is by its very excess measurably independent of the Government's attitude as a patron or the reverse. What the Republic has done has been mainly to give security to art. Mr. Hamerton also discusses suggestively the question whether sculpture is not peculiarly entitled to fostering by Government, as being handicapped in the struggle for existence by the insufficiency (in the nature of the art) of private support. This paper and those which are to follow, it is intimated, are supplementary to the writer's works on 'Contemporary French Painters,' and 'Painting in France after the Decline of Classicism,' published more than twenty years ago.

The most interesting part of Mr. E. A. Maund's account of Mashona Land in South Africa, published in the January Proceedings of the Royal Geographical Society, is that relating to the ruins of Zimbabye and the surrounding country. They are built of granite "hewn into small blocks, somewhat bigger than a brick, and put together without mortar," a herring-bone course generally forming the ornamentation. In their neighborhood are always to be found gold workings, and some of them enclose circular roasting-floors. He suggests that they may be of Phœnician origin, but, in the discussion which followed the reading of the paper before the Society, Mr. J. Theodore Bent stated that he believed them to be Persian of the time of Kosroes II., A. D. 590-628, the conqueror of Egypt. In support of this theory he referred to the recent discovery of some very interesting ruins near Zanzibar which had been proved to be distinctly of Persian origin. This latter gentleman, well known for his explorations in Asia Minor and Persia, is about to go to South Africa with a view to the careful examination of these ruins. In this he will be actively aided by the British South African Company and the Royal Geographical Society, and his expedition will be well equipped for geographical as well as archæological survey.

A speech of Prince Nicholas of Montenegro to some of his soldiers, reported in the *Gazette* of Cettigne, seems to indicate the opening of a new era of prosperity for that country. After reproaching them for their exclusive devotion to warlike pursuits, he directs that "every Montenegrin soldier who lives where vines can be grown shall plant this year 200 vines. Commanders of brigades shall plant twenty, commanders of battalions ten, officers of lower rank five, and non-commissioned officers one olive tree apiece, and whoever shall voluntarily plant 2,000 vines this year shall be exempt from taxes for ten years." The *Gazette* believes that these commands will be obeyed by the army, and that 4,000,000 vines and 20,000 olive trees will be planted next spring.

"Hedda Gabler," Henrik Ibsen's latest play, is to be produced shortly at the Royal Theatre in Munich and at the Lessing Theatre in Berlin. The Director of the Dagmar Theatre, the first of the Copenhagen private houses, has made a proposal for producing the piece, but Ibsen is said to be waiting for a similar offer on the part of the Royal Theatre, where "The Lady from the Sea" was brought out. The book does not seem to have met with general favor in Denmark, where an Ibsen reaction has begun to set in. Some of the Danish re-

viewers even go so far as to laugh occasionally at the northern sphinx, and to accuse him of something very like posing.

—The February *Atlantic* uses for its leading article "Some Unpublished Letters of Charles and Mary Lamb," edited by Mr. W. C. Hazlitt. The main point of the editor is to declare that the Lamb letters have not been printed with that accuracy and faithfulness which he deems essential, nor so completely as may hereafter be possible; he desires an edition which shall be founded (so far as is practicable) upon a comparison of the texts with the manuscripts still existing, and which shall not be characterized by suppression or modification of the writer's phrases. This, coming on the heels of Ainger's recent edition, is very discouraging. As to the new letters in the present series, they are exceedingly trivial in interest, and it would be a generous scale indeed that should include them in any collection. At the present pace, the correspondence of any author who survives a decent number of years seems likely to exceed his published works, however voluminous; and we cannot think that literature will gain by approximating the model of its memoirs to that of a *Congressional Globe*. Schopenhauer succeeds Hegel as the philosophical topic, and Mr. Percival Lowell goes on to Noto by an easy canter, both mental and physical, and writes of trifling things with a charming *esprit*, being always facile, entertaining, and ingenious, and occasionally varying the ordinary text of travel with the moods of a sentimental journey, in no unpleasing way. Politics past and present provides three articles: an excellent portrait of Rutledge, a striking example of how the Civil-Service Commission brought up the quota of the Southern States, and a vigorous review of the French spoliation claims by Dr. Everett. A paper on the future of our public parks, by Alpheus Hyatt, dwells mainly on the utility of scientific collections to be made in them for popular instruction, and goes so far as to suggest that these should be so complete as to allow of loans of specimens for the use of schools and private students. The author deprecates the value of books in comparison with living examples—in zoölogy, for example—and would have a kind of live library of animals and insects to be used after the analogy of free libraries of books.

— *Harper's* reproduces for its frontispiece Sargent's portrait of Booth in a very unsatisfactory way, and one turns to Mr. Aldrich's accompanying lines for the true picture of the man. The number is liberal in travel articles, and gives Finland, the Strait of Magellan, and the desert of the Pacific Slope, all with plentiful illustration and a sufficient text. The other articles that catch the eye are the series of drawings by Thackeray out of an album, and the somewhat misleading title, "The Faith of President Lincoln." The latter article is mainly an account of why and how Chase resigned the Secretaryship of the Treasury and Fessenden received it, and of Lincoln's determination to make Chase Chief Justice, if the opportunity came to him, at the very time when he was making the change in the Treasury. Miss Hutchinson's extracts from the gossipy letters and characterizations of Willis, fifty years ago, are more entertaining than such papers are apt to be.

—*Scribner's* continues the subject of Japan in Sir Edwin Arnold's already sufficiently characterized papers, and of Africa in an historical review of explorations on that continent. Another paper on Neapolitan art introduces the works and career of Michetti, and is wound up with some brief notes upon Gemito. Mr. R. H. Stoddard tells of his autographs, with somewhat belated criticism of Addison, Dickens, and the rest of those represented. The most interesting piece in the reproduced autographs is a poem by Addison, hitherto unpublished, and now unfortunately dragged to light: it is an operatic song, utterly withered now, if a thing originally so artificial can be said to wither. The leading paper, on "Mount Washington in Winter," is the most readable part of the number, and gives occasion for some very striking cuts of mountain scenery in the arctic season.

—The Grolier Club of New York has already helped to raise the standard of book-making in this country, and its exhibitions are a constant incentive to further improvement. It has printed a catalogue of an exhibition of "Recent Book-Bindings, 1860-1890," held at its handsome club-house in the last week of December and the first few days of January. This catalogue, printed with dignified simplicity, as becomes the publications of a book-lover, has a brief introduction (by Mr. William Matthews, we understand), and it contains nearly 300 titles. The collection was one of extraordinary richness, containing as it did some of the best work of the late Trautz-Bauzonnet, of Mr. William Matthews, and of Mr. Cobden-Sanderson—the strongest names of the contemporary binders of France, America, and England. In its way and of its kind, nothing could be better than Mr. Matthews's 'Colin Clout' (No. 254), with its grasses and shepherd's pipes; or than M. Capé's 'Dialogue' (No. 238), with its adroit and satisfactory interlacing of two shades of red morocco; or than M. Petit's 'Rubáiyát' (No. 182), with the elegant simplicity of its Aldine pattern; or than Mr. Cobden-Sanderson's 'Aucassin et Nicolète' (No. 104), a triumph of formal decoration at its richest. Beautiful also, and more curious, were certain volumes bound for Mr. S. P. Avery; here we had books dealing with the minor arts, and each decorated with a specimen of the art it treats of—enamel, faïence, cloisonné, glass, etc. Certain other of the bindings exhibited by Mr. Avery were well worthy to drive the poor brethren of book-lovers to envy, hatred, and malice.

—To the January number of the *English Illustrated Magazine*, Mr. Cobden-Sanderson contributes a paper on the art of book-binding as he understands it and as he practises it; and the essay is well worth reading, for itself and for the light it sheds on the specimens of the art exhibited at the Grolier Club. Mr. Cobden-Sanderson's views are a little Ruskinish, which is against them; and his designs are akin to Mr. William Morris's and Mr. Walter Crane's, which is not against them, perhaps. But he has no difficulty in "making hay" of the views of Mr. Wheatley and other inartistic British writers who have discussed glibly the principles of the art, only to reveal their lamentable ignorance. Among the nine or ten half-tone illustrations which accompany Mr. Cobden-Sanderson's article is one of the lovely little 'Aucassin et Nicolète' shown at the exhibition of the Grolier Club. Another is a 'Story of Sigurd,' *simplex munditiis*. The best of these designs, as here reproduced, show Mr. Cobden-Sanderson's earnest striving to develop the art of book-decoration, and to take it out of the rut of slavish imitation of the departed masters.

—Mr. William E. Simonds of Connecticut, to whose intelligent activity the success of the International Copyright Bill in the House of Representatives must be partly ascribed, is circulating in pamphlet form his speech delivered on December 3, 1890. Mr. Simonds, we are glad to see, forcibly insists upon the enactment of the measure which he advocates because it is right, but he starts off by showing the material advantages involved in it, more particularly to American printers. He quotes the testimony of Mr. J. L. Kennedy, on behalf of the International Typographical Union, before the House Judiciary Committee, to the effect that if the bill becomes a law, "the literary and book-publishing centre of the English world will move westward from London and take up its abode in the city of New York." As regards book-printing, this really seems to be the belief of the English publishers, to judge from a recent editorial in the London *Bookseller*. This possible result is, of course, highly gratifying to Mr. Kennedy, who points out further good things in the bill as follows: "The American author who goes abroad in search of a cheaper publishing market, sending his shell-plates over here to be mounted and to have his press-work done, or else sending the printed sheets home to be bound here, thus evading the heavier duty on bound books, will also be *compelled* [the italics are ours] to patronize home industry for his mechanical work. In short, it is not difficult for printers to see that such a law will confer inestimable benefits upon their own and allied trades." We should suppose not. The difficult thing to understand is, why, when the authors of the American Copyright League had consented to give up the privilege of printing their books abroad, the printers were so slow to see an advantage so obvious.

—Mr. Simonds believes in the author's natural right to protection for his productions, and says: "Either we must deny that the result of the foreign author's labor is his property, or else we must face the shame of confessing that we take his property simply because he is a foreigner and not strong enough to keep it away from us by superior physical force. . . . The author's title to his property is the very best; it is rooted in the creation of the article, and the world concedes that no better title can be imagined than that which arises from the making of the thing." To show the status of the United States, as compared with other nations, Mr. Simonds gives a table of the terms of protection accorded by the present copyright statutes of various countries. To this list should be added the following countries, all of them having passed copyright laws: Chili, Greece, Hawaiian Islands, Hungary, Luxembourg, Monaco, and Portugal. The terms of protection, also, for a few countries are not correctly stated, and should be corrected as follows: Bolivia, not only author's life, but fifty years beyond; Denmark, not fifty years, but author's life and fifty years; Hayti, not "author's life, widow's life, children's lives, and twenty years," but author's life, life of his widow, and to children, if any, for twenty years longer, but if no children, then to heirs or assigns for ten years; Holland, during life of author, if he survives the term of fifty years; France, author's life and fifty years, not thirty; Peru, author's life and twenty years, not fifty; Sweden, not author's life and ten years, but author's life and fifty years.

SIR WALTER SCOTT'S JOURNAL.

The Journal of Sir Walter Scott, from the original manuscript at Abbotsford. 2 vols. Edinburgh: David Douglas; New York: Harper & Bros. 1890.

WHO can reproduce the subtle charm and

pathos of Scott's Journal? The one English critic whose genius could find some happy word or sentence which was at once the explanation and the revelation of an author's true character is gone. Matthew Arnold has left no successor. Mr. Swinburne, when not carried away by the redundant flow of his own words, might, it is true, give us a criticism of Scott as brilliant and as truthful as his analysis of the poetry of Coleridge or of Arnold. Mr. Swinburne, however, has not, as far as we have observed, published anything on the last, and in one sense the most interesting, of Scott's works, and it may well be doubted whether there be any other living English critic who can utter the final word concerning the most delightful, if also the saddest, chapter of autobiography which for many a year has been added to the literature of England. Meanwhile, ordinary reviewers, not gifted with the insight of genius, must necessarily content themselves with that unsatisfactory form of criticism which consists in analyzing, as far as may be, the qualities of a literary work, without attempting to penetrate to the one predominant characteristic which, when discovered, gives unity to the apparently contradictory features either of a book or of a character.

In few literary products is this appearance of contradiction more clearly marked than in Scott's Journal. It is monotonous, yet it is full of interest; it contains no new information, yet it adds immensely to our knowledge of the man who was, not only in Scotland, but throughout the English-speaking world, the literary monarch of his day. The diary is in one sense very modern, for it appeals to that sympathy with individual feeling, to that intense desire to enter into the character and thoughts of striking personalities, which is a leading feature of our time; it is in another sense thoroughly old-world in tone and coloring, for to the discriminating reader every line of it discovers the untold change of thought, of opinion, and still more of feeling, which divides the present generation from the age of Scott, of Moore, and of Sydney Smith. It is little more than sixty years ago since Scott began his diary and wrote the greater part of it, but it is far more than sixty years—it is nearer a century—since the character of Scott and his contemporaries was formed. A small part of the Journal was penned in 1832, the substance of it was set down between 1825 and 1830; but its tone and sentiment are the echo, not of 1830, but of 1800, or it may be of 1790. In it the thoughts which filled the minds of the men who made the opening of this century glorious to England, are repeated by the greatest writer of that day to the generation who will see the nineteenth century to its close.

The monotony of Scott's Journal must, to any candid critic, seem indisputable:

"Wrote my task, then walked from one till half-past four. Dogs took a hare. They always catch one on Sunday—a Puritan w'd say the devil was in them. I think I shall get more done this evening. I w'd fain conclude the volume at the Treaty of Tilsit, which will make it a pretty long one, by the by. . . . Then I will try something of my *Canongate*. They talk about the pitcher going to the well; but if it goes not to the well, how shall we get water? It will bring home none when it stands on the shelf, I trow. In literature, as in love, courage is half the battle.

"'The public, born to be controlled,
Stoops to the forward and the bold.'"

This, with slight curtailment, is the diary for October 1, 1826. It is a favorable specimen of the summaries of work and the notes of daily trivialities which fill up the mass of the Journal.

"Wrote my task"; "wrote five pages before dinner"; "wrought hard"; "I find the difference on 2,000 additional copies will be £3,000 instead of £1,000 in favour of the author. . . . Such another year of labor and success would do much to make me a free man of the forest"; "corrected proof-sheets in the morning for Dr. Lardner, then I had the duty of the court to perform"; "finished correcting proof for Tales, 3d Series. The court was over soon. I was much exhausted on the return home, quite sleepy and past work."

These expressions are picked up almost haphazard from different parts of the book. Take the Journal where you will, you will find sentences like them. They are, to a reader of an understanding mind, filled with pathos. But they are monotonous to a degree approaching dulness. Yet the book is full of intense interest.

Two circumstances relieve it from anything like dreariness. It is, it is true, in parts a mere memorandum of work done, but it is also, especially in its earlier portions, a picture gallery of characters. One can hardly fail to see that Scott intended that ultimately, though no doubt after his death, the Journal should be published, and he aimed at making it a series of sketches. Some of these pictures taken from life are as good as anything in his novels. Mrs. Coutts and her kindliness, friendliness, and vulgarity; Mackenzie, who lived to the world as the 'Man of Sentiment,' whom men supposed to be "a retired, modest, somewhat affected man, with a white handkerchief and a sigh ready for every sentiment," but was in fact "as alert as a contracting tailor's needle in every sort of business—a politician and a sportsman—shoots and fishes in a sort even to this day and is the life of the company with anecdote and fun"; Lord Minto and the curious legends of which he became the subject; Glengarry, who "is a kind of Quixote in our age, having retained in their full strength the whole feelings of clanship and chieftainship elsewhere so long abandoned," and "seems to have lived a century too late to exist in a state of complete law and order, like a Glengarry of old whose will was law to his sept"—and a dozen more of men, some unknown, some (such as Wordsworth or Pitt) whose names will never be forgotten, are brought before our eyes by vigorous sketches which, though sometimes mere outlines, are sometimes studied pictures drawn by the greatest novelist of his age. Among the most elaborate of these portraits stands one which well deserves attention, both because of its completeness and because it gives us the traits of a man whose character had a great deal to do with Scott's pecuniary calamities. Constable, writes Scott—

"was a prince of booksellers; his views sharp, powerful, and liberal; too sanguine, however, and, like many bold and successful schemers, never knowing when to stand or stop, and not always calculating his means to his objects with mercantile accuracy. He was very vain, for which he had some reason, having raised himself to great commercial eminence, as he might also have attained great wealth with good management. He knew, I think, more of the business of a bookseller in planning and executing popular works than any man of his time. In books themselves he had much bibliographical information, but none whatever that could be termed literary. He knew the rare volumes of his library not only by the eye, but by the touch, when blindfolded. . . . Constable was a violent-tempered man with those whom he dared use freedom with. He was easily overawed by people of consequence, but, as usual, took it out of those whom poverty made subservient to him. Yet he was generous and far from bad-hearted. In person good-looking, but very corpulent latterly; a large feeder and deep drinker, till his health became weak."

If variety is given to the Journal by portraits of Scott's contemporaries, its vital interest is derived from another source: it is the truest portrait of Scott himself. From this point of view the very monotony of the book, the way in which it repeats again and again certain traits of the author, becomes its real charm. In Scott's nature were blended two features which, according to ordinary experience, are rarely found in the same character. Romance and imagination were in his case connected with great powers of action, with businesslike energy, and, to speak quite honestly of a man great enough to bear the most honest criticism, with prosaic and businesslike aspirations. He was a man of action, whose energy and imagination found, from the stress of circumstances, their chief sphere in literature. But he could hardly be called in the strict sense of the word a man of letters. His ambition and his weaknesses were not literary; he seems to have been absolutely free from the vanity or irritability often connected with a poetic temperament. He seems, further, where uninfluenced by romance, to have been little touched by higher aspirations which are at any rate supposed to be cherished by poets. Sense and imagination seem in him to have been almost equally balanced. The strength, indeed, and the solidity which marked one side of his character conceal, it may be suspected, from modern readers the strong element of romance, or even of dreaminess, which not only made Scott a poet, but, odd as the assertion may sound, moulded the course of his life.

Whoever wishes to realize what Scott was in youth should try, if possible, to see a picture of him in his earlier days possessed by Mr. John Murray, the London publisher. It contains traits of dreaminess hardly to be found in the better-known portraits taken of Scott in later life. But to an intelligent reader the Journal will supply the place of any portrait. The five years passed first in the dreams of love, and then in the sorrow of a hopeless lover, count naturally for very little in the pages of Lockhart's Life; but the letter from Lady Jane Stewart and his intercourse with his aged friend after the receipt of that letter till the day of her death, as well as the reference to his visit to St. Andrews, tell plainly enough how deep had been the impression made by Scott's first love, both on his heart and on his imagination. Never was a man less given to overestimate his own imaginative powers; he had none of the weaknesses which make some writers delight to dwell on their own dreaminess. Yet he himself knew that he was at bottom a dreamer:

"I do not compare myself in point of imagination with Wordsworth—far from it; for his is naturally exquisite and highly cultivated by constant exercise. But I can see as many castles in the clouds as any man, as many genii in the curling smoke of a steam-engine, as perfect a Persepolis in the embers of a sea-coal fire. My life has been spent in such day-dreams. But I cry no roast-meat. There are times a man should remember what Rousseau used to say: '*Tais-toi, Jean-Jacques, car on ne t'entend pas!*'"

But, side by side with this most genuine and undoubted imaginative and romantic cast of mind, ran a vein of the most energetic turn not only for action but for business. To realize this side of Scott's nature, a reader should peruse the dull but instructive memorials of Archibald Constable. They prove that, long before the period of Scott's ruin, his literary powers had been turned by him to the purposes of trade. His writings were the huge, the inordinate contribution to the stock in trade of the firm or firms whereof he was virtually a member. A good deal is said both by

Scott and by Scott's critics about his desire to found a family and a family estate. This told for much, but it is difficult not to think that a real liking for the activity and the chances of business told for a good deal also. It is impossible to believe that he was a man really fond of money—his lavish liberality to others negatives this idea; but he was, it may be suspected, fond of money-making. He liked the activity of life; he worked best, as he believed, under pressure. He risked or sacrificed the attainment of literary perfection for the sake both of gaining the emoluments of literary success and of carrying out bold schemes of literary adventure. In this blending of imagination with habits of business he exhibits a curious affinity with one of the severest among his critics. Macvey Napier's letters contain a statement by Macaulay of his reasons for not reviewing Lockhart's 'Life of Scott.' They amount to this: that the review ought to be written by an ardent admirer, but that Macaulay, while admiring Scott's genius, and fully appreciating the strength of Scott's character, and especially his freedom from literary vanity, condemns strongly the weaker side of the poet's character, and especially his sacrifice of literature to his desire for gain.

The letter is, like most of Macaulay's criticism, a very vigorous statement of a one-sided view. It is true as far as it goes, but does not contain the whole truth. Perhaps the severity of the criticism was due in part to an indistinct consciousness of the likeness between the historian and the poet. In Macaulay's genius, as in that of Scott, there was, as any one will see who sympathetically reads Trevelyan's Life of his uncle, a strain of ardent romance. Each writer displayed that kind of historical imagination which consists in seeing, and making his readers see, the pomp and pageant of history. Each was a man the ardor of whose fancy never carried him far away from the ground of solid good sense; each blended literary power with keen interest in the affairs and especially the politics of the world. But the contrast between them lay in this: Macaulay, who actually took part in politics, was primarily and essentially a man of letters. Love of literature, and the ambition for literary fame, were the intellectual passions of his life. Scott, who never, except as an outsider, took a part in the game of politics, was at bottom a man of action. Both men had a keen appreciation of the solid advantages of a prosperous existence. This to a certain class of minds will always deprive both Scott and Macaulay of that admiration which is due to men who dream of, even when they do not always pursue, a high ideal. Both of them possessed this great quality, that they lived more nearly than most men up to their ideal. The apparent happiness of Macaulay's lot masks a certain latent heroism which never had opportunity for its full display. The calamities, on the other hand, which darkened Scott's later years, showed his full greatness to the world. The tragedy which destroyed his happiness as justly insured his fame.

All the world knows, in a general way, that Scott's strength, his mental powers, and at last his life, perished in the effort—in the main a successful effort—to pay the debts which he had incurred as a partner of Ballantyne's and also of Constable's. But the full heroism of the struggle can only be appreciated by those who carefully study the Journal. Scott could have saved himself from the labor, which was too great even for his gigantic powers of work, by becoming bankrupt. Many men would have thought that the sacrifice of the wealth which he possessed when speculation, for which he was only partly responsible, brought him to ruin, would have satisfied the claims of justice as fully as they in fact would have satisfied the demands of the law. His strong good sense freed him from any morbid fear of the mere name of bankruptcy. He says, in so many words, that he was afflicted by not being able to pay his creditors, that he recked little being called a bankrupt. He judged his position with characteristic coolness; he knew that a temporary sacrifice of wealth would have ended in securing to him ease and riches; but this course was forbidden to him by an almost stoical sense of duty.

"I could not," he says, "had I taken it, have slept as I now can under the comfortable impression of receiving the thanks of my creditors and the conscious feeling of discharging my duty like a man of honour and honesty. I see before me a long, tedious, and dark path, but it leads to true fame and stainless reputation. If I die in the harrows, as is very likely, I shall die with honour; if I achieve my task, I shall have the thanks of all concerned and the approbation of my own conscience."

This is the language of a man who never uttered a word of cant, entered in his private diary for his own eyes. The fate he foresaw overtook him. He did in substance achieve his task, but he died "in the harrows." He triumphed over difficulties which would have daunted any man of inferior powers; he fell before disease brought on by his own superhuman labors. In this point of view the monotonous records of his task-work, such as have been already cited, have immense significance. They are the memorials of constant, unremitting, and disinterested labor. No doubt Scott's literary reputation suffered as much as did his health by his absolute devotion to the one duty of paying his just debts. Task-work rarely partakes of inspiration, and the Journal itself shows, page by page, the gradual decline of its author's powers. As we approach the end, the vigor, the originality, and the variety which mark the earlier pages vanish. The one thing which does not disappear is Scott's determination to perform his appointed work.

Yet it would be an error to suppose that his genius did not show its force even in his later years. Much of the work which he produced between 1825 and 1828 would have gained high repute for any other man. 'Woodstock,' 'The Tales of a Grandfather,' 'The Life of Napoleon,' were all brought forth in these years. The latter has not held its own as a final estimate of the French Emperor. No work produced in 1827 could have contained the last word, or anything like the last word, on the character of Napoleon, and no book written under the conditions under which Scott produced the 'Life of Napoleon' could have become a classic. One volume was written in six weeks, but no man then living could have produced off-hand, under the circumstances under which Scott worked, so effective a piece of historical biography as Scott's 'Napoleon.' 'The Tales of a Grandfather' is not, and does not pretend to be, a work of erudition, but it is even now a model of the manner in which history may be written for children.

One other fact, which is not sufficiently noticed, adds a peculiar glory to Scott's labors. Misfortune neither crushed his independence nor soured his heart. Modern Liberals will not greatly sympathize with the political efforts of Malachi Malagrowther; but every man of spirit will admire the courage which made Scott, on behalf of what he deemed the cause of Scotland, beard the Tory Government from whom he might naturally look for patronage. The whole history of his generosity to Gillies shows how little his own mishaps deadened his zeal in helping others. But the most pathetic sign of his greatness, no less than of his kindliness, is to be found in his constant effort not to darken the lives of his children and of his friends by his own sadness. Scott says of himself that he was a stoic. The expression seems rather a strange one as applied to a man who enjoyed as intensely as he did the good and pleasant things of life. But Scott was right. The foundation of his character was stoicism of the noblest kind—the stoicism of a man who determined to bear all things bravely, and above all things took heed that his own suffering should not mar others' happiness.

CARLIER'S AMERICAN REPUBLIC.

La République Américaine: États-Unis. Par Auguste Carlier. Paris: Guillaumin et Cie., 1890. 4 vols., 8vo, pp. xvi., 588, 619, 597, 632.

M. AUGUSTE CARLIER, who died last March at the age of eighty-seven, was a French lawyer, but had retired from the practice of his profession at the age of forty-three with a competence, and had subsequently spent several years in travel in the various countries of Europe, studying their manners and customs, but more especially their political institutions. In 1855 he came to this country, remaining here more than two years, part of which he devoted to visiting all accessible sections of the Union, but also residing during considerable intervals in Washington, Boston, New York, and Philadelphia. In the last-named city he was elected a member of the American Philosophical Society. During his stay here he became intimately acquainted with many of our leading men, such as Thomas Benton, Judah P. Benjamin, Edward Everett, George Ticknor, Henry C. Carey, Josiah Quincy, Longfellow, and Sumner. It will thus be seen that he had opportunities of becoming familiar with the varied points of view from which Americans regard their own country. He took copious notes of everything he saw and heard and of his conversation with Americans, and after his return to France he continued his studies of our institutions by a diligent perusal of the principal printed sources of information, including not only such works as Bancroft, Hildreth, Story, but also public documents, reviews, and newspapers. Becoming convinced that Tocqueville had generalized on an insufficient basis of facts, and that consequently many of the conclusions drawn in 'Democracy in America' were unreliable and in need of rectification, he resolved on writing an exhaustive work on every aspect of American society, but subsequently thought it better to attack so vast a subject in sections.

The first fruit of his labors was a small volume on 'Marriage in the United States,' which appeared in 1860, and a translation of which, by Dr. B. Joy Jeffries, was published in Boston in 1867. While not free from such odd errors as foreigners are likely to fall into in judging so delicate a subject, it struck the right note in calling attention to the grave defects in our divorce laws, which were afterwards submitted to so searching a criticism by Dr. Woolsey. The other works of M. Carlier were: 'Slavery in its Relations to the American Union' (1862); 'A History of the American People and their Relations with the Indians to 1776,' 2 vols. (1864); 'The Acclimation of Races in America' (1868), and, finally, the book now before us, which occupied the last twenty years of his life, and is, no doubt, with its 2,452 pages, the most voluminous work that any foreigner has ever produced on our country—excepting, of course, Von Holst's 'Consti-

tutional History,' which belongs in another category.

The first book, filling 427 pages of volume i., is a history of the formation of the English colonies in America, and mainly an abridgment of the author's previous history in two volumes. In making this abridgment M. Carlier keeps his eyes constantly fixed on the constitutional development, on the growth of political institutions, on the modifications slowly undergone in the colonies by the common law of England, on the growth of town government, and other cognate topics. The second book, which occupies the remainder of the first volume, is a history of the War of Independence and of the Confederation, also keeping the political element chiefly in view, and showing how the necessity of a firmer union made itself felt by men of all parties. The second volume opens with book third, describing the labors of the Convention and the Constitution which they produced. The method pursued is somewhat peculiar. The Constitution is presented, not merely as it left the hands of the Convention, but as it is in force now, after having undergone various modifications. Thus, a special section of one of the chapters gives an account of the law of 1886 changing the succession to the Presidency in case of the incapacitation of both the President and the Vice-President. There is also a history of the Electoral Commission of 1876. As the following book gives a separate account of amendments to the Constitution, it would seem as if any but American readers must find some difficulty in getting an entirely clear idea of the subject. Book 4 treats of the organization of the Government and the amendments to the Constitution; like some of the preceding divisions, it is partly historical, partly expository. The thirteenth, fourteenth, and fifteenth amendments are each made the subject of a separate chapter. The ministerial departments of the Government, that is, the Department of State, the War Department, and so on, are next taken up and described, one at a time. There is also a chapter on the civil service.

Book 5 treats of the human races in the United States—that is, the white, the red, the black, and the yellow, as the author classifies them. The naturalization laws are also considered. The sixth book is a history of the District of Columbia and an account of its peculiar form of government. This anomaly, which we accept as a matter of course, would naturally excite the curiosity of a foreigner. Of the sixty millions of our people, the inhabitants of Washington alone never vote and have no voice whatever in the government of the country or even in their own local affairs. So complete an atrophy of home rule and so perfect a specimen of paternal government it would be hard to match anywhere in Europe outside of Russia. The seventh book treats of the Territories, giving a general account of their history and legal status, as well as a separate history of each Territory and a geographical and statistical description. The eighth book, containing 150 pages, and completing volume ii., is called "The National Domain," and treats of the public lands, the Homestead and Preëmption Laws, the Yellowstone Park, Bounty Land Warrants, the cessions of land to colleges and to the Pacific railroads, and the Inter-State Commerce Act, although the last-named subject is not logically related to the matter in hand. With an equal disregard of strict logical consistency, we have here a history and description of the several Pacific railroads. An appendix contains a translation of the Constitution.

Volume iii. begins with Book 9, treating of the Army, the Navy, and the Militia, in 120 pages. It contains a varied mass of information on such topics as the condition and pay of officers and privates, the articles of war, courts-martial, the judge-advocate, the academies at West Point and Annapolis, the marines, the organization of the militia, etc. Book 10 (200 pages) treats of the State governments, and Book 11 (112 pages) of local government, describing the Borough, Village, Town, Township, City, and the organization of municipal corporations, and devoting separate chapters to the municipal institutions of New England, of New York, of Illinois, to the city of New York, to county government. Book 12 is on religious institutions from a legal point of view, embracing such topics as the marriage and divorce laws, the exemption of churches from taxation, etc. Book 13, completing Volume iii., describes our system of public instruction, from the common schools up to the universities and including the public libraries.

Vol. iv. opens with Book 14, which gives, in 239 pages, a detailed account of the judiciary system of the Union and of the States, including the jurisdiction of the various courts, the manner of appointment and election of judges, the function of marshals and other court officers, the jury system, the character of the legal profession, the method of impeachment, etc. The remainder of the volume, comprising 407 pages, is an elaborate history of the treatment of the Indians from the Revolution to 1888; the period before the Revolution having been covered by the previous history of the author, already mentioned. It is not merely a history, for it also describes the mode of life of various tribes of Indians, as well as the efforts made for their education, giving an account of the Hampton and Carlisle schools and other minor establishments.

Naturally, the first question that suggests itself in regard to this work is as to its relation to the classical treatises of Tocqueville and Bryce. M. Carlier himself challenges comparison with Tocqueville by frequent corrections of statements made by the latter in conflict with facts as ascertained by the later author. Undoubtedly M. Carlier has collected a far greater mass of material than Tocqueville, and even greater than Bryce; but he is not their equal in insight or in philosophical breadth of view. Although half a century has passed since Tocqueville wrote, and many startling changes have taken place in the interval, Tocqueville seized the salient points of our institutions and national character with the intuition of genius which can do wonders with the scantiest materials, and which the widest range of information cannot wholly replace. Mr. Bryce, by virtue of his practical knowledge of English politics, of his previous studies, of the natural bent of his mind, possessed qualifications for his task which we could hardly expect to find united in another writer, and least of all in a Frenchman. But while it is no disparagement to M. Carlier to pronounce him inferior to the two eminent writers with whom he competes, and while he has left untouched some very interesting subjects which they have treated in so masterly a manner—as, for instance, the influence of our institutions on our intellectual and literary development—it must be said, in his favor, that he includes a number of topics which they have not touched upon, and which add greatly to the value of his book. The chapter on the District of Columbia has already been referred to. What is perhaps the most useful part of the book for American readers is the long account of the Indians with which the work closes, and which contains information collected from a variety of sources and nowhere else brought together in so compact and convenient a form. Altogether we have here an encyclopædia of facts concerning our country, which only needs an index to make it a valuable work of reference. In the main it is an exception to the proverbial inaccuracy of French writers when treating of English or American affairs. It is true the author sometimes falls into an odd blunder, as when he speaks, on more than one occasion, of offices being held "till good behavior," or when he says that the University of the City of New York is maintained at the public expense. A more serious fault is that the book is not up to the same date in all its parts, and various portions of it seem to have been finished at various times. Thus, although in regard to the admission of new States and other facts M. Carlier comes down to 1889, he does not seem to know that the Commissioner of Agriculture has been raised to be a Cabinet Minister, or that the city of New York is no longer governed under the Act of 1882, which required the Mayor's nominations to office to be confirmed by the Aldermen. But in a work of such magnitude a few small errors are to be expected, and hardly detract from its undoubted merits. European readers who study this book together with that of Mr. Bryce will know more about us and our belongings than many an educated American knows about his own country or any other.

TUTTLE'S FREDERIC THE GREAT.

History of Prussia under Frederic the Great. By Herbert Tuttle, Professor in Cornell University. Two volumes: 1740–1745, and 1745–1756. [Cited in Index as History of Prussia, vols. ii. and iii.] Boston: Houghton, Mifflin & Co.

In a volume published several years ago, Prof. Tuttle sketched the beginnings of the Prussian State, and described the development of the monarchy under the first two Kings. In his two later volumes he covers only one-third of the reign of Frederic II., the narrative closing with the outbreak of the Seven Years' War.

It is clearly the plan of the author to write institutional history; and although the personality of Frederic the Great has modified the execution of the design, and made portions of these later volumes almost purely biographical, the original purpose has not been sacrificed. It is the entire life of the State that is depicted. Diplomacy and war do not so fill the field of view as to obscure the methods of internal administration or the social and economic development of the people. But while the plan is admirable, the execution leaves something to be desired. The author, who was a journalist before he became an historian, obviously wishes to give his readers résumés, characterizations, rather than undigested masses of facts. But there is more than one method of digesting facts. Prof. Tuttle's may be described as judicial: he sums up and charges. He is not content simply to describe an institution—he is irresistibly moved to pass judgment upon it; and his chief desire seems to be the communication to the reader of his own opinion. When, for example, he tells us how justice was administered, the revenue collected, agriculture fostered or burdened, trade promoted or handicapped, we gain but a general and hazy idea of the facts, a mere inkling of the purpose of the legislator, but a very distinct im-

pression of the author's approval or disapproval of the measures in question. He has obviously studied the evidence in each case, but it is the judgment that we get, and not the record upon which the judgment is based. As to the value of the judgment, this seems to us to be partially vitiated by a too modern point of view. The problems presented in welding a heterogeneous population into political unity are not sufficiently distinguished from those which arise in administering a State already formed, with the consciousness of unity imbedded in the minds of its inhabitants.

It is in much the same spirit that the author approaches Frederic the Great. The policy and morality of each act are weighed ; the genius and the character of Frederic are constantly criticised. The historian is always on the bench ; the King is always at the bar—if not in the dock. The judgment itself is frequently able and suggestive. Prof. Tuttle's estimate of Frederic's genius is saner and truer than Carlyle's. There is, in the second of these volumes (the third of the entire history), a striking analysis of the King's strength and weakness as a soldier, a diplomatist, and an administrator. Starting with the indisputable proposition that Frederic's tactics were far superior to his strategy, the author points out that the same merits and defects which characterized Frederic's generalship appear in his conduct of foreign affairs and of internal government. He had more insight than foresight. In the moment of action, and all the more if the moment were one of peril, he was singularly fertile in expedients and quick to choose the most hopeful. But he lacked the patience, perhaps the ability, to calculate beforehand, in a protracted military or diplomatic campaign or in a wide-reaching movement of internal reform, the course of action which would secure the most lasting advantages with the least risk. It was not a far-sighted diplomacy which left Prussia exposed to a coalition between France, Russia, and Austria. It was not the highest statesmanship which made the officials of Government automata. But, after all these allowances, with what indomitable courage, inexhaustible resource, and elasticity under defeat were the perils of the Seven Years' War surmounted ; and how extraordinary were the results accomplished by the governmental machine that Frederic had perfected! It is the most striking portion of this brilliant career that the author has yet to describe, and the picture which he now presents to us is necessarily an imperfect one. If he carries the history on through the Seven Years' War, it is not probable that he will see cause to retract or modify any of his judgments; and yet the impression left upon the minds of his readers will not be the same when Frederic's whole career is considered, in place of a part.

In estimating Frederic's moral character, the author condemns without qualification and with no recognition of "mitigating circumstances." Some writers would be disarmed by Frederic's own frankness. The King who wrote to his Minister, just before the unprovoked invasion of Silesia, that it was time to work up the question of Prussia's legal claims, "*for* the troops have received their orders"; who explained to Voltaire that "ambition, interest, the desire to make people talk," determined his action; who said to Montalembert, after the partition of Poland, "Of course Catherine and I are two brigands, but I should like to know how Maria Theresa has arranged the matter with her confessor"—the King who thus confessed judgment on the score of morality does not seem to need further censure. To many besides the author, it is true, such utterances mean only that Frederic added cynicism to unscrupulousness. But if cynicism is preferable to hypocrisy, Frederic stands morally above most of his contemporaries and many statesmen of the present century.

It does not seem to occur to Prof. Tuttle that Frederic's cynical avowals may be viewed, on the one hand, as the reaction of a thoroughly genuine nature against cant, and on the other as a demurrer against the applicability of private morals to international affairs. The doctrine of the *grande morale* is indeed repudiated by most moralists, and is certainly a dangerous one. The rules of this system—if there be any—have not been worked out with the relative precision which characterizes ordinary or "little" morals. But most statesmen have recognized the difficulty of squaring political action with ordinary standards. Cavour recognized it when he said : "If we had done for ourselves what we have done for Italy, we should be great scoundrels." The standard to which Cavour here refers his conduct, and by which he impliedly justifies it, is the interest of the State. The interest of the State was the avowed standard of Frederic's actions, and no one has ever more thoroughly fitted his deeds to his creed. He was not merely the first, but the most faithful, of its servants. He considered himself the trustee of its interests. In his personal affairs, he might, if he chose, be generous ; as head of the State he had no right, he declared, to sacrifice its interests to generous impulses or to moral scruples. We may well hesitate to accept such a rule of political action ; but before criticising the statesman who accepts it and acts upon it, we should try to understand it, as it seems to us Prof. Tuttle does not. For a single example, take his discussion of Frederic's withdrawal from the Franco-Bavarian alliance in 1742. Prof. Tuttle writes :

"A favorite figure by which he [Frederic] described his policy was taken from a shipwreck at sea, where each person saves himself as best he can. That kind of selfishness often characterizes, it is true enough, the conduct of passengers on a shipwrecked vessel. Is it not also true that the world generally reserves the title of hero, not for the man who in the hour of danger seizes the first boat and escapes, but for the faithful captain who remains at his post until all the others are saved, and is the last to leave the sinking ship?" (Vol. ii., pp. 188, 189.)

Is it not also true that the writer of these lines has wholly failed to distinguish between the sacrifice to duty of one's self, and the sacrifice to a generous impulse of interests not one's own, but held in trust? In his picture of the heroic figure on the ship's bridge, he forgets that the question was not of Frederic's escape from personal peril, but of the safety of the Prussian State. He confuses what it is Frederic's great merit to have distinguished, the interests of the head of the State and the interests of the State itself. Of the heroism of self-sacrifice for the State Frederic repeatedly showed himself capable; most strikingly, perhaps, when he directed his ministers, in case of his capture by the enemy, to disregard him entirely and act only in the interests of Prussia. Had the King adapted his conduct to the historian's standard, it is safe to say that Prussia would not to-day be a State of the first rank, nor at the head of united Germany. It is not improbable that it would have ceased to exist.

In his preface to the first of these volumes, Prof. Tuttle apologizes for treating the subject after Carlyle. The apology is unnecessary. In the first place, much of the material now accessible to the historian of this period was inaccessible to Carlyle; and this newly published material Prof. Tuttle has evidently studied and used. In the second place, Carlyle wrote less as an historian than as an advocate. Our author, although he strives to be judicial, is something of an advocate too; but he is less of one than was Carlyle, and he is retained by his sympathies for the other side. He is *advocatus diaboli*, and objects, with much force, to the canonization of Frederic as a "Protestant hero." His book, accordingly, will furnish a very useful corrective to Carlyle's—if the same public will read it. It is an easier book to read, because it is more simply written; but it is also an easier book to lay down unfinished. As literature, the two books are not in the same class. As a history (which, according to Prof. Seeley, should have no literary quality at all) Prof. Tuttle's book is the better. There is not only room for both these books, but for a third, in which Frederic shall neither be assailed nor defended, neither condemned nor canonized, but simply explained.

The book is carefully written, and, in the main, carefully printed. A reference to the "Prussian rifles" (vol. ii., p. 158) seems anachronistic. There are some misprints, especially in foot notes (see vol. ii., pp. 38, 63, and 64), but we have found only one that is misleading. In vol. iii., p. 85, it is stated that Frederic William I. left the regular army "at some eight thousand." The author undoubtedly wrote "eighty thousand." The volumes are admirably indexed.

The First Crossing of Greenland. By Fridtjof Nansen. Longmans, Green & Co. 1890. 2 vols., 8vo, xxii, 510, and x, 509 pp.

THE author of these two portly volumes, a native of Norway, and a scientific student in the University of Kristiania, began his arctic experiences in his twenty-first year, accompanying the sealer *Viking* in 1882 to the region between Spitzbergen, Jan-Mayen, and Greenland. When fast in the ice off the Greenland coast, the idea occurred to him that it might be practicable to land and cross the inland ice. On his return to Norway he was appointed Curator of the Bergen Museum, where he remained engaged in zoölogical studies until 1888, receiving his doctor's degree in 1887. In 1889 he married a sister of Prof. G. O. Sars of the University of Kristiania, and at the present time is engaged in preparations for an arctic expedition planned for 1892.

The idea of exploring the frozen interior of Greenland was broached publicly by Dr. Nansen in 1887, when he made an unsuccessful appeal to the Norwegian Storthing, through the mediation of the University, for a grant of some $1,400 in aid of such a journey. A liberal Danish gentleman, Mr. Augustin Gamél, the patron of the *Dijmphna* expedition of 1883, generously offered to provide the necessary funds. This offer was gratefully accepted by Nansen, and the preliminaries were entered upon at once.

An important element in the plan consisted in the use of *ski* (pronounced "she"), or the flat wooden snow-shoe in use in so many northern countries. Nansen himself is an expert in their use, and, to carry out his ideas, it was necessary that the remaining members of the party should be well skilled in the management of these, to Americans, rather unfamiliar articles. With their aid, under favorable conditions of weather and snow-surface, long distances can be accomplished in a remarkably short space of time. In 1884, during some experiments conducted by Baron Nordenskiöld in Lapland, a Lapp thirty-seven years of age in

21 hours and 22 minutes made a run of 220 kilometres, or more than 136½ miles. Ordinarily, with good conditions prevailing, a practised man should cover forty or fifty miles a day. In America the conditions do not seem to be generally as favorable for the use of ski as in Northern Europe, and the long practice necessary to become expert, or even to be moderately comfortable while using these shoes, militates against their introduction. The long, narrow Indian snow-shoe of the Hudson Bay and Alaskan region is much better suited to the loose, dry snow ordinarily prevailing, and, so far, there are no signs that they will be superseded. So important for the success of his plan was the use of ski that Nansen incorporates in his book a chapter entirely devoted to them, their names, geographical distribution, and classification.

The party consisted of Dr. Nansen, assisted by Otto Sverdrup, Lieut. Oluf Christian Dietrichson, and Kristian Kristiansen Trana, besides two Lapps, Balto and Ravna. They left Kristiania in May, 1888, for Iceland, via Leith, having made arrangements with the owners of the sealer *Jason* to be called for at Isafiörd early in June. The *Jason* was to do its best to put them ashore on the east coast of Greenland, after which their fate depended upon themselves. Their outfit was, of course, carefully considered, and consisted chiefly of light hand-sledges, tent and bedding, a spirit lamp and cooker, condensed rations, and boats for the Greenland landing.

On the 17th of July the party left the *Jason* off Sermilik Fiörd, about latitude 65° 30′, and succeeded in getting within less than ten miles of the coast. But the fates were against them, and it could not be attained. A drift of ten days in the floe ice carried them southward some 230 nautical miles, when they were enabled to penetrate the broken floe and work with oars and sails, under cover of the shore, in the painful endeavor to recover the lost ground. Their journey was enlivened by an encounter with the East Greenlanders and a short stay at one of their encampments. On the 10th of August a definitive landing was made in latitude 64° 23′, at a small bay defended by bare rocky points and islets, known as Umivik. At nine in the evening of August 15, all arrangements having been completed, the party set forth.

For a week they struggled over the crevassed surface and steep ascent of the seaward face of the inland ice. After that, crevasses were heard of no more, the surface becoming prairie-like; sometimes, owing to the fine powdery snow, very hard going for both sledges and ski. Some Indian snow-shoes proved their worth at such times. The general direction taken was a little southward of west; the greatest height attained on the ice was 8,922 feet; the temperature at night was unprecedentedly low, reaching —50° F. at times. During the day it would be about zero Fahrenheit, or even higher. The distance over the ice from coast to coast on the line traversed is about 9°, or about two hundred and seventy-five statute miles. The land of the west coast was seen on the 19th of September, on which day, aided by a strong breeze and improvised sails, the travellers covered about forty miles of the descent. But it was not until the 24th that they were free from the dangerous margin of the inland ice and actually stood upon bare ground beyond it. The point reached was the head of Ameralikfiörd in latitude 64° 13′. Here a boat was constructed of canvas somewhat resembling a coracle, in which Nansen and Sverdrup happily reached Godthaab, where they were warmly welcomed. A messenger was despatched to the last ship of the season, which was at the cryolite mine of Ivigtut, on the point of departure for Europe. It was too late; the captain did not feel authorized to return to Godthaab, but was able to carry back to civilization the news of their success and safety. The winter in Greenland and the scientific results afford material for several chapters.

The book is pleasingly written and well translated. The attempt was a bold one, and the success complete and well deserved. It is but just to say, however, that the scientific results, though valuable, are chiefly confirmatory of what had previously been believed, on circumstantial evidence, by most students of arctic matters. It is now settled that the interior of Greenland, south of latitude 70° N., is covered with a low, nearly smooth dome of ice and snow, from which no peaks project, which is free from crevasses, and which yet, from the character of its surface, is not easy to travel over. The very low night temperatures and the wide range between night and day temperatures form the most striking feature of the meteorology.

By way of criticism, it is obvious that Dr. Nansen is diffuse. This diffuseness is aggravated by the publishers, who have double-leaded the text, and we have two uncomfortably heavy and unwieldy volumes, containing matter which had better have been compressed into a single volume of half the size of either. The book is well illustrated and printed; the binding is flimsy and in bad taste; the index is satisfactory.

Memoirs of the Military Career of John Shipp. London: T. Fisher Unwin; New York: Macmillan & Co. 1890.

THIS is a reprint of the edition of 1843, and is the third volume of the "Adventure Series." The drag-net of the editors of this collection will doubtless bring back to the light of day many long-forgotten tales of hair-breadth 'scapes by land and sea, but it is doubtful if they will come across such another combination of humor, pathos, and extraordinary vicissitudes as that which fascinates the reader of these memoirs. That a man should have twice won a commission from the ranks by the time he was thirty, without any of the advantages of education, and by sheer force of merit, is a unique performance in the annals of the British Army, and bespeaks the possession of unusual capacity; but none of his military achievements seem more admirable than is this modest account of them.

John Shipp was born in 1784, and, having early lost his parents, passed a miserable boyhood in the service of a brutal farmer. So wretched was his existence that he hailed with delight the chance of enlisting—at the tender age of thirteen years—in one of the "experimental regiments" formed for the training of boys in that warlike epoch. His uniform was so much too big for him that if his martial ardor had not been of lasting quality, it would surely have been quenched by ridicule. But he bore without flinching the jeers of his companions, as he did also the dressing of his hair in the military fashion of the time, which drew the skin of the face so tight that the unfortunate private could not possibly shut his eyes! In the year 1803 Shipp's regiment was ordered to India, and he gives a vivid account of life on a troop-ship, on board of which several infectious diseases were raging at the same time. After a stay of some months at the Cape, where his military career was nearly ended by a love affair, he again embarked in a small *American* vessel for Calcutta, and, after a voyage of five months, rendered perilous by the tendency of the vessel to take in water as her captain did grog—in excessive quantities—he gazed upon the "beautiful fortifications of Fort William and the city of palaces beyond with astonishment and delight." He was soon marched up the country to take part in the siege of Bhurtpore, and it was here that he first showed the remarkable courage and devotion to duty that gave assurance of his success as a soldier. He led three forlorn hopes in desperate and unavailing assaults on the fortress, and, though badly wounded in several places, was soon in fighting trim again.

He thus describes the sensations with which he entered on these terrible encounters:

"In these moments there is an indescribable elation of spirit; the soul rises above its wonted serenity into a kind of frenzied apathy to the scene before you—a heroism bordering on ferocity; the nerves become tight and contracted; the eye full and open, moving quickly in its socket with almost maniac wildness; the head is in constant motion; the nostril extended wide, and the mouth apparently gasping."

It would be interesting to know how far this expert testimony is borne out by the recollections of others who have passed through similar ordeals. In one point we feel certain that Shipp's opinion would meet with general acceptance among soldiers, namely, that liquor will not inspire courage on such occasions, or, as he puts it: "If a man have not natural courage, he may rest assured that liquor will deaden and destroy the little he may possess."

Promoted to a lieutenancy in 1805 for brilliant services in the field, Shipp returned to England in 1807, and, becoming involved in debts, obtained leave to sell his commission. With the proceeds he paid all he owed, and, six months later, having failed to find any employment, he reënlisted as a private in a cavalry regiment. In 1809 he again set sail for India, and the fact that it took the regiment eleven months to reach Meerut marks the remoteness of the India of those days—an all-important element in the problem of its government. After some years of faithful service, he was again promoted from the ranks and given a commission in the Eighty-seventh or Royal Irish Regiment. It was of this regiment that some general officer, during the Peninsular War, remarked to the Duke of Wellington that they marched very unsteadily. "Yes," said the Duke, "but they fight like devils!" And this was still one of their characteristics while Shipp was with them in the second campaign of the Goorkha war, and in the Mahratta war of 1817–18. He says that the men showed a promptness to obey and a willingness to act which he had rarely met with, but he was uncertain whether this was due to the rigid discipline of the corps or was characteristic of the Irish as a nation.

With this regiment Shipp did gallant service for some years until in 1823 he entered into a turf speculation in partnership with one of his superior officers. As might have been expected, this arrangement resulted in quarrels and intemperate correspondence, and in the end a court-martial deprived Shipp of his commission. Misfortunes never come single, and when the letter from England confirming the findings of the court was delivered to him, he was mourning the recent loss of his wife and trying to console his two motherless babes: "And when my eager eyes met the words *dismissed the service*, I could not repress the tear of anguish, nor refrain from indulging in the most unavailing grief." Surely a most pathetic ending of a brilliant career! After his return to England he wrote these memoirs and

several military romances in order to eke out a trifling pension granted him by the East India Company, and finally became superintendent of the night watch in Liverpool, where he died in 1834.

Considering Shipp's lack of education, the story of his life is remarkably well told. His language is occasionally involved and high-flown, but he shows considerable descriptive power, and his natural shrewdness is constantly apparent. He points out that while the native troops under English officers are in many ways excellent soldiers, too great care cannot be taken to avoid interfering with the prejudices of their several castes, and with prophetic insight he predicts as probable the neglect of this precaution which actually caused the mutiny of 1857. Elsewhere he raises the question of the morality of sharp-shooting from behind cover, which, in his opinion, "treads close on the heels of cowardice if it does not come under the designation of actual murder." The tendency of modern strategy is decidedly in the direction of availing of natural cover or of providing artificial cover to offset the development of arms of precision, so that the conditions are much changed since Shipp's time; but it would be difficult in any case to establish a *moral* superiority in favor of any particular method of destroying an enemy based upon the risk run by the destroyer.

The Royal House of Stuart, illustrated by a series of Forty Plates in Colors drawn from Relics of the Stuarts by William Gibb, with an Introduction by John Skelton, C.B., LL.D., and Descriptive Notes by W. H. St. John Hope, M.A. Macmillan & Co. 1890. Folio, pp. xiv., 40.

THIS very handsome book is indirectly a memorial of the recent Stuart exhibition, just as we have to expect a similar book of Guelph antiquities, say eighteen months hence, as a sequel to the exhibition lately described in these columns. There is, however, very little mention of the immediate occasion for the present publication. It stands by itself, text and illustrations. The text consists chiefly of Mr. Skelton's introduction, which is a very interesting sketch of Scottish regal history from the accession of Robert the Bruce, or even an earlier time. The author is one who has tried his hand already at historical writing, and has endeavored especially to throw light on the disputed questions of Scottish chronicle. In these pages of general disquisition he has sought to avoid too plain an expression even of his very visible opinions. He shows an extreme desire to be fair, to be unprejudiced, to state or assert nothing that he has not an opportunity to prove. Thus, in the case of Mary Stuart, he gives his opinion regarding the probable plot against her, in which John Knox and the English Cecil are said to have taken part, but he is careful to explain and give references; and where he cannot do this, he shows a curious eagerness to state both sides and to bid the reader choose. Evidently he is a believer in the inevitableness of many of the great events of history. The fates were friendly, and one had only to follow their plain bidding and even blunders would not change the result. The fates were hostile, and no care, no honesty nor clear-sightedness would have saved the lost cause.

A student of the sad history of Scotland may be especially liable to this kind of opinion or feeling. Nowhere else is so forlorn a series of long royal minorities, of feeble princes appearing when the strongest and wisest were needed, of ill-directed and ill-managed struggles against an enemy of overwhelming force; and, when this enemy had disappeared, of government by the most selfish and grasping of oligarchies. The sketch before us, written by one who is in touch with the latest archæological research and historical thinking, is a valuable prompter and guide, and one might read the history of Scotland with the greater enjoyment and intelligence for this suggestive teaching. There is some attention to details, too, in spite of the limitation of the work to forty folio pages. Carlyle's opinion as to the value to the historian of authentic portraits of public personages—to which might have been added Michelet's practice of using them as authoritative documents—is disapproved; and in this connection an interesting reference to Lord Lovat's portrait and that of Claverhouse is made. Pen portraits, too, of some important persons are given, mostly very good. It is a desirable piece of reading, and one very different from the common perfunctory Introduction to a book of plates.

As to these plates, they are excellent color-pictures, and Mr. Gibb's repute is such that we can trust them implicitly for all that they show. It is open to question whether, in such cases as these, artistical effect ought not to give way to minute rendering of details; the student would be glad, in many instances, of a common photograph in addition to the color-print; but the plates are good and satisfactory, on the whole. As to the subjects, since they are brought together to commemorate the Stuarts, and not for their intrinsic value, the examples cannot vie in importance with the Spitzer catalogue, nor with 'Le Trésor Artistique de la France,' nor with Babelon's 'Antiquités de la Bibliothèque Nationale,' nor with any one of a score of books devoted to art and artistic archæology, pure and simple. On the other hand, some rather commonplace things, such as the works just named do not contain, are rather welcome to us here. A cuff of Lord Darnley's glove, or the embroidered leading-strings of James the Sixth of Scotland and First of England, or the harquebuse with which Bothwellhaugh shot the Regent Moray, are none of them rich and splendid enough for the book of Decorative Art; and yet one rather likes to see them. For another reason one is glad to see the large detailed drawings of the crown, the sword of state, and the sceptre of Scotland—objects which are repeated in very inadequate woodcuts till one is weary of the ugly pictures. And the ivory casket of the Cardinal of York, the cibarium called Malcolm Canmore's cup, the Indian powder-horn, and the embroideries generally, are well worthy of the costly plates that contain them.

We conclude that twenty-five of the forty plates deserve their place here; the subjects of the other fifteen would be sufficiently shown in small text-illustrations, or, in the case of the locks of hair of Charles I. and Mary Stewart, might as well be omitted.

The History of Herodotus. Translated into English by G. C. Macaulay, M.A. Vols. I, II. Macmillan & Co. 1890.

The Works of Xenophon. Translated by H. G. Dakyns, M.A. Vol. I. Macmillan & Co. 1890.

EACH of these translations makes good its right to existence, though their methods are curiously diverse. Each is painstaking, accurate, and scholarly; each is superior in various respects to any of its predecessors in English, and vastly superior to most of them. Each is not only exact and faithful, but, on the whole, attractive in style—a work which the gentleman of scholarly tastes will consult with pleasure as well as profit, and the scientific person who does not read Greek may quote without risking confusion of face.

It is interesting to observe how different are the processes of the two translators. Mr. Macaulay aims, "above all things, at faithfulness—faithfulness to the manner of expression and to the structure of sentences, as well as to the meaning of his author." He believes that it is a mistake to try to represent the simplicity of Herodotus and his occasional quaintness by affecting an archaic style, as Rawlinson has done, or to lose his poetic coloring "in an attempt by courtier phrase to render his style more noble." It is by no means easy to follow Herodotus closely and gracefully at the same time. The structure of many of his sentences is alien to that of the English, and others present intrinsic difficulties. The passage we cite from the 'Euterpe' shows some of these difficulties and the characteristic manner in which the present version meets them:

"The customs which they practise are derived from their fathers, and they do not acquire others in addition; but, besides other customary things among them which are worthy of mention, they have one song, that of Linos, the same who is sung of both in Phœnicia, and in Cyprus and elsewhere, having, however, a name different according to the various nations. This song agrees exactly with that which the Hellenes sing, calling on the name of Linos, so that *besides many other things about which I wonder among those matters which concern Egypt*, I wonder especially about this, namely, whence they got the song of Linos. It is evident, however, that they have sung this song from immemorial time, and in the Egyptian tongue Linos is called Maneros. The Egyptians told me that he was the only son of him who first became King of Egypt, and that he died before his time, and was honored with these lamentations by the Egyptians, and that this was their first and only song."

There is some awkwardness in the lines we italicize—an unnecessary awkwardness, we believe—but this arises from the conscientiousness of the scholar, not from a servile fidelity to the letter; and this conscientiousness has generally reaped its reward in reproducing, not only the tone and spirit, but the charm of the original. The brief notes of the translator and the extremely careful index of proper names have a special value for scholars. The text followed is that of Stein's critical edition; but the notes embody the results of a careful independent examination of the Medicean MS. in all places where questions about the text might concern a translator.

Mr. Dakyns has begun by falling in love with his author, and certainly this is a good beginning for a translator. His work, indeed, bears evidence of being a labor of love. It is full of enthusiasm; and whereas Mr. Macaulay confines himself austerely to his text and a minimum of useful notes, Mr. Dakyns introduces his favorite with a preface, a life, and a profusion of discussions and eulogies, which are executed with so much zeal and knowledge as to be generally pleasing and valuable. He adds to these some admirable maps and a running commentary of useful and scholarly footnotes. All this he does with the devotion of an ardent admirer. Nothing is too good for Xenophon. He admires his life, his character, and his style. He would have him rendered by Mr. Ruskin or by Mr. James Russell Lowell. To ourselves the notion of harnessing either of these highly imaginative stylists to such work seems whimsical in the extreme. Admitting all the charms of Xenophon's character and the impressiveness of his wonderful march, one cannot but feel, when reading his 'Hellenica' or his 'Memorabilia,' that, beside

Thucydides or Plato, he is an *esprit borné*. In the matter of style, Mr. Dakyns himself confesses his inequality, and his mixed vocabulary of old poetic words and neoterisms. In this connection, he remarks, with a certain artlessness of conception:

"If the correct Victorian English, as it is sometimes named, of our own land to day may be allowed to stand for the newer Attic of Isocrates's time, Xenophon is not unlike an able American of the moment, bringing forth from the treasure-house of language vocables new and old. At one time, and quite naturally, he will use words bearing the stamp of Elizabethan or of Puritan times; at another, he employs some specimen of the latest vernacular, which has hardly as yet received the consecration of literary usage. The combined dignity and freshness of a style so composite, employed by a writer of tact and delicacy such as Xenophon, might perhaps be represented by any one who could write as gracefully and freely as the author of 'My Study Windows.'"

It is evident that Mr. Lowell has mystified one of his English friends, and perhaps we have no right to dispel the mystery. Still, for the sake of accuracy, we may be allowed to suggest that Mr. Lowell uses his vocabulary deliberately, with certain artistic intentions, while it is noted by some ancient critics that Xenophon mingled his archaisms and neoterisms with the excusable carelessness of the old soldier and the much-travelled man of action. Mr. Dakyns, if we may say so without wounding the partiality of a lover, has shown himself perfectly competent to reproduce the beauties of Xenophon's style. He has chosen Goldsmith as his model in English—how happily may be seen everywhere as well as in the following passage:

"Leaving these quarters, they marched the whole of the next day over snow, and many of the men were afflicted with 'boulimia' (or hunger-faintness). Xenophon, who was guarding the rear, came upon some men who had dropt down, and he did not know what ailed them; but some one who was experienced in such matters suggested to him that they had evidently got boulimia; and if they *got something to eat*, they would revive. Then he went the round of the baggage train, and, *laying an embargo* on any eatables he could see, doled out with his own hands, or sent off other able-bodied agents to distribute to the sufferers, who as soon as they had *taken a mouthful got on their legs* again and continued the march. *On and on* they marched, and about dusk Cheirisophus reached a village, and surprised some women and girls who had come from the village to fetch water at the fountain outside the stockade."

We have italicized here certain turns of expression, and we venture to say that every one of them is more sprightly than the original. Mr. Macaulay would not have permitted himself these vivacities of idiom; the general effect of them is that the translation is lighter, more readable than Xenophon's own sentences; and this is the worst we have to say of a most skilful, accurate, and charming performance. The work is to be completed in four volumes, the first containing the 'Hellenica,' books i, ii, and the 'Anabasis.'

". . . Brugmann's book forms one of the indispensable tools of every student of Indo-Germanic Philology."—*G. M——r. (Literar. Centralblatt, 1887, No. 8.)*

(From the N. Y. Nation.)

The significance of this masterwork of Brugmann for the progress of science is to be measured, not so much by the new material it contains, nor by any definite settlement of long-disputed questions it may offer, as by its complete control of the entire existing material of the science, by its deftness in assorting it, and its priceless clearness in the statement of results. It represents the complete triumph of an ordinary mind over the most distracted material. Seldom are united in one man as in the author so comprehensive and exactingly thorough an acquaintance with the detail of his subject, and so fine a sense for the relation of the part to a scheme of the whole.

NOW READY:

Anne Bradstreet
AND HER TIME.

By HELEN CAMPBELL.

1 vol., 12mo, ... $1.50

A charming biographical sketch and study of the earliest of America's female writers, "the grandmother of American literature." Anne Bradstreet's descendants number some of America's most distinguished men of letters—the Danas, the Channings, the Buckminsters, Oliver Wendell Holmes, Wendell Phillips, and others of lesser note. Mrs. Campbell has told her story with all the vigor and interest that could be expected from so earnest a writer, and has inspired the musty records of the past with life and spirit, making for the reader of to-day a very real and vital person of that old-time champion of woman's possibilities, Mistress Anne Bradstreet of Andover.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 5, 1891.

The Week.

THE Supreme Court having taken jurisdiction of the *Sayward* case, the case is now to be argued like any other in which private rights and property are involved. The owner of the *Sayward* complains that his ship was seized in Bering Sea when she was engaged in lawful enterprise fifty-nine miles from any land, and was brought before a District Court of the United States in Alaska acting as a court of admiralty and maritime jurisdiction, and that said ship is in danger of being condemned and sold contrary to the right and contrary to the law of nations. Wherefore, he prays that said District Court may be prohibited, etc., etc. The Attorney-General of the United States, we are told in a despatch to the *Tribune*, was taken somewhat by surprise by the action of the Supreme Court. But at the State Department this action "is not giving rise to either apprehension or alarm." On the contrary, Mr. Blaine "commends it most warmly." The telegram goes on to say that Mr. Blaine is "willing to submit to the Supreme Court the whole dispute for *arbitration*, providing he has an opportunity to submit, not simply a single law point, as is done in the present case, where the court is asked to decide the legality of a seizure inside [outside ?] the three-mile limit, but the entire question, involving among many other things a definition of the jurisdiction exercised by Russia in Bering Sea and its legality; her power to dispose of such rights, if rights they were; the exact nature of the jurisdiction acquired by the United States, together with all historical and not merely legal lights thrown upon the subject; the undisputed jurisdiction for many years of the United States in that sea, etc."

All this is very droll as touching a lawsuit where a record has been made up, and where issue has been joined, and where a rule has been entered requiring the inferior court to show cause within a certain time why a certain writ should not issue. "If," continues the telegram, "Mr. Blaine had a guarantee that all of these points would be submitted to the court, and, furthermore, that the British Government would agree to bind itself by the decision of such a tribunal, and that it would not, as in the present case, announce unofficially that it will disregard the decision of the court, according as it suits its convenience or not, he would be willing enough to accept the arbitration of the Supreme Court." The public may reasonably ask what practical end is to be gained by Mr. Blaine's willingness to accept arbitration of an impossible kind under impossible circumstances. Of what use is his readiness to turn into the Supreme Court a lot of papers that the court would be obliged to pitch out of the window? This is the last of the many oddities of the Bering Sea case under Mr. Blaine's treatment. Perhaps it means that Mr. Blaine sees a decision looming up that will be very disagreeable to him, and that he wants to prepare the public mind for it by showing that the case was not properly presented. If he wanted real arbitration, why did he not take it when it was offered to him?

The Republican managers in the Senate have served formal notice upon the Democratic leaders in the body that the Force Bill is dead. The admission thus grudgingly made has been extorted from unwilling partisans by the power of public opinion. The Republicans have fourteen majority in the Senate, and thus the numerical ability to pass any measure. The Force Bill was one of the chief issues submitted to the people for their approval or disapproval last November. The Republicans said to the voters, "Go to the polls and say what you think about it; if you elect a House with a Republican majority, the Republican Senators will interpret the result as a vote of confidence in the policy embodied in the Force Bill, and they will then pass it; if you elect a Democratic House, it will be accepted as an expression of lack of confidence, and the Republican Senators will feel inclined to drop the bill." It was a frank appeal by the politicians to their masters, and the masters left no room for doubt as to what their orders meant. The Bourbons among the Republican Senators set out to disregard the popular will, but enough Senators were found who recognized the force of public opinion to defeat the scheme. Great credit is due to those Republican journals which represented this opinion, and thus sustained Republican Senators in carrying it into effect.

The man who emerges from the struggle with most harm to his reputation is Mr. George F. Hoar, who has shown himself ready to sacrifice all the principles which he had maintained as essential even to civil liberty, in order to push through a purely partisan measure. This is a melancholy spectacle for an "old public functionary" to present, the more so that sixteen years ago Mr. Hoar was on the right side when a similar issue arose. He was one of those Republicans who, after the "tidal wave" of 1874, argued and filibustered day after day in the House of Representatives against the Force Bill of that period, and thus, although a minority in the House, held it back until so late in the session that their allies in the Senate could beat it in the latter body. It was a great service to the cause of popular liberty and self-government, and it would have been a happy thing for Mr. Hoar's reputation if his public career had then ended.

We turned with much curiosity to Speaker Reed's article in the new number of the *North American Review*, with the very taking title, "A Deliberative Body," expecting to find some defence or explanation of that now famous ejaculation of his, "Thank God, this is not a deliberative body!"—meaning, as was understood, that the House of Representatives was a body which enacted laws, but did not talk about them. We have been greatly disappointed, however. The article is very much subdued in tone as compared with the Speaker's former one on the same subject—as becomes his altered circumstances—and is very apologetic; but of real explanation or defence there is very little. He pleads that nearly all needful debating of public questions in this country is now done by the newspapers, and that, therefore, parliamentary debating is not so useful or necessary as it once was; that the present Congress got from the majority of the electors a mandate to do what it did, and that therefore the Democratic obstruction was as unnecessary as it was improper. Here is where the hole in his argument occurs, and it is as wide as a church door. We venture to say there has never yet been persistent obstruction by the whole minority in any parliamentary body of the first rank, where the majority was *undeniably* trying to execute a mandate of the electors. No rational person, as Speaker Reed well knows, has deliberately maintained that the McKinley Bill was imbedded in the platform on which the Republicans went to the country in 1888. The subsequent obstruction was offered to an absolutely new scheme, for which there was no precedent in the history of this or any other country, and of which no hint or outline was ever offered to the voters, by any newspaper or orator, during the canvass, and which there was much reason to believe was concocted subsequently to the election by a small clique or junta of which he was a member, in virtue of a bargain with the contributors of campaign funds.

Speaker Reed fails to point out, in his comparison of the House of Representatives to the English House of Commons, the totally different position occupied by the respective Speakers of these bodies. In the present Congress Mr. Reed himself as Speaker occupied, in relation to the McKinley Bill, exactly the position Mr. Gladstone occupied towards the Home-Rule Bill, or Mr. W. H. Smith towards the Irish Coercion Bill—that is, he was charged with its carriage through the House as the leader of his party in the House. When he drew up rules giving himself power to suppress debate, he was really providing himself with the means of squelching his own political opponents. If it were seriously proposed in the House of Commons that the leader of the majority on the floor should have the power to decide which of the mi

nority was to be allowed to speak and when the minority had talked enough, it would be received with shouts of derision; and yet this is exactly what Speaker Reed's rules did in the House of Representatives. In England the Speaker is a strictly judicial officer, who studiously abstains from all partisan connection with pending measures. Speaker Reed is nothing of the sort. He is a fierce and avowed partisan, and stumped his own State last fall in that character, and took to himself the credit of pushing through the McKinley Bill. To take on himself under these circumstances the task of putting down the minority in defence of a novel and unforeseen measure, was probably one of the most absurd pieces of partisanship ever witnessed. In truth, we can recall nothing like the position he occupied last winter, and still occupies, in the history of parliamentary bodies within the present century, except that occupied by De Morny and Rouher in the French Senate and Corps Législatif respectively, under the Second Empire. These two officers performed for the Emperor the exact functions which Mr. Reed has been trying to perform for the protected manufacturers.

The appearance of the new Senator from Kansas, as described in the despatches, is rather startling. "A gruffly hoarse but low-toned voice issuing from a sea of long, dark beard flowing nearly to his waist," demanding in the Senate the issue of unlimited money directly by the Government to the people, might well produce a depressing effect on the stock market, and bring American securities home from Europe. But any one who reads the speech he made after his election will readily see that the Judge is by no means a shape of dread. He is apparently one of those extremely active-minded men who always come to the front in revolutionary times, and the times in the West just now are very revolutionary. The rapidity with which he has changed his opinions in the past shows how open he is to conviction, and makes it pretty certain that when brought in contact, in Washington, with new ways of looking at things, and new currents of thought, he will again revise them. He was once, it seems, an ardent Republican; he has now completely repudiated his old party. He was once a strong protectionist; he is now a free-trader. The particular craze which now dominates him is the notion that the Government ought to lend money to all comers at low rates of interest—presumably without security. It may seem odd that a man who has education enough to write books and edit newspapers, should never have sat down and thought out for himself how this system would work in practice, or how money which anybody could have for the asking could retain its efficiency as a measure of the value of other things, which is its sole function. The explanation is to be found, we think, in the tremendous force with which a popular consensus acts on individuals. Hardly any man can resist the pressure on his own mind of the general agreement of all his neighbors in any absurdity, however great. In a community of obstreperous debtors or borrowers, even the most sensible man after a while begins to feel the necessity of giving security for loans to be a piece of monstrous oppression; and the difficulty of getting money at all without selling something, to be the result of some hidden defect in the national system of finance. The extreme form of this phenomenon is to be found in the well-known peril to mental soundness which lies in prolonged attendance on or association with the insane.

Mr. Peffer's defeated competitor, Ingalls, is in the meantime getting that consolation which awaits all charlatans in our day, in the shape of invitations to lecture. This, too, is his time to consider and act promptly on proposals from dime museums. There is a golden moment, in these careers, for purposes of public exhibition which, once gone, never returns. Mr. Ingalls, indeed, carries with him into his retirement the proud consciousness that he is a male. Of this character no legislature can deprive him. The "Epicenes" whom he has so often held up to scorn, may now laugh at him, but they cannot deprive him, even in this hour of adversity, of his sex. History will record that he was the most distinguished male, *qua* male, in the United States Senate towards the close of the first century of the national existence. Now that he has been beaten, Republican newspapers are very frank in declaring that he is an arrant demagogue who ought to have been beaten. But he is no worse demagogue to-day than he had shown himself to be over and over again during the last few years; and yet during these years the Republican Senators twice conferred upon him the highest honor in their gift by making him President of the Senate, and Republican organs had no word of protest to utter.

The Omaha Farmers' Alliance resolved among other things on January 28, "that the volume of the currency be increased to $50 per capita," and then at the same time "demanded" that paper money be placed on an equality with gold—probably the heaviest burden ever put upon public financiers. One of the Omaha papers, the *Morning World-Herald*, apropos of this, supplies the farmers with the following wisdom:

> "The charge is, that the undue scarcity of money, owing to the failure of the Government to provide an adequate supply, has a tendency to make the rich richer and the poor poorer. This idea finds confirmation by the examples of two European nations. France is one, England the other. In France the supply of money amounts to about $60 per person—that is to say, ——————; but in England the circulating medium amounts to only about $15 per person, that is to say, ——————. The circulating medium, therefore, is about four times as great per person in democratic France as in autocratic England. How about pauperism? England is compelled to spend $60,000,000 a year to take care of paupers, that is to say, ——————; but in France the annual expenditure for the care of paupers is only $10,000,000, that is to say ——————, or only one-sixth what it is in England."

There would not be much use in going into the question of fact with an economist of this sort; we cite the passage as in part an explanation of the ideas about currency which are now ravaging the West. A very large body of the farmers of that region are now really peasants fresh from Europe, with all the prejudices and all the liability to deception of their class. The old boast about "American intelligence" does not any longer apply in any sense to large bodies of population in the Northwest. Most of our political questions are very tough subjects for them, but a cruel fate could not have selected a more unfortunate subject for them to vote on, when they get here, than the regulation of the currency. No enemy of democracy has, in fact, ever imagined a grosser *reductio ad absurdum* of the democratic theory than the submission to the popular vote of the question how much currency a commercial nation ought to have, and of what material it should be made.

The extract we have made above from the *World-Herald* shows the kind of help the farmers get in forming their opinions on these questions from the only political guides they have — the local newspapers. The editor is about as well informed as they are—in fact, does little for them except to put their ideas in type. He ought, of course, to be a man who could tell the convention that if national prosperity and individual happiness and comfort depended on the volume of the currency, and the Government could make the volume of the currency what it pleased, it would be almost criminal to fix the amount at $50, or, indeed, at any figure whatever. It would be the duty of a civilized government to go on issuing fresh currency until pauperism and even poverty not only had been reduced, but had totally disappeared. If by means of a currency of $60 per head France has cut down the cost of maintaining her paupers to $10,000,000, it is very wrong of her not to proceed to issue as much more currency as will cause the extirpation of pauperism. In fact, if poverty can be extirpated by currency, and currency may be anything the Government pleases, we have at last discovered the philosopher's stone, and the greatest cause of human misery is on the point of disappearing. Can any man who is concerned about the future of the country, read these farmers' lucubrations on national finance without feeling the enormous importance of having the mechanism of exchange (we will, to avoid offence, say nothing about the principles of taxation), taught in the public schools?

It is scarcely necessary for any one to waste strength in attacking the compulsory-voting proposition which Gov. Hill has been urging upon the Legislature for the past three years, for the plan never has had any support among the members and is not likely to have any. There is something quite ludicrous in the advocacy of this most theoretical of all reforms by a Governor who professes such boundless con-

tempt for "theorists" of all kinds. He thinks it would be "unconstitutional" to compel a free American citizen to vote by means of a blanket ballot, because that would require him to cast a ballot upon which were the names of candidates not of his choice; but he is warmly in favor of compelling all citizens to register and vote, no matter whether they wish to or not, and of organizing in support of such compulsion an elaborate system of fines and penalties, and an illimitable body of officials to enforce them. So far as interference with the "constitutional" rights of citizens was concerned, this would make the voting of a blanket ballot appear somewhat trifling.

The preliminary report of the Commission on Taxation in New Jersey is a depressing document. It is not altogether prepossessing to see that the Commission selected as one of their counsel the son of the Governor under whose administration they were appointed; but this, we suppose, can nowadays be regarded as only a trifling indelicacy. But it is truly deplorable that the representatives of a great and enlightened community should publish the record of their flounderings among the meshes of antiquated fallacies from which an acquaintance with the elementary principles of economics would have delivered them. Thus, they lay it down as indisputable that obligations and promises to pay are property that should be taxed just like tangible wealth; that if the depositors in a bank draw their checks for a million dollars, there is an actual creation *ex nihilo* of a million dollars' worth of property having "every characteristic that should induce it to contribute towards the expenses of the State." As the Clearing-house records show a weekly creation of property of this kind to the extent of a billion of dollars, statesmen who consider it the true policy for a State to levy all the taxes possible are naturally eager for the exploitation of this new source of revenue.

The puerility of this report is further manifested by the statement that no dissatisfaction with the tax law of Massachusetts is known in that State, and by the suggestion that evasion of taxes upon property of the kind above described could be prevented by refusing the aid of the courts in the collection of notes not stamped as listed by the assessor. The Commissioners apparently suppose that capitalists are under some compulsion to lend their money in New Jersey, where they obtain a less return than they can get elsewhere. Undoubtedly there are serious abuses under the present system in that State, some of which are correctly described in this report, but we fear that no improvement is to be expected as a result of the labors of the present Commission. Unhappily, a large proportion of the most intelligent citizens of New Jersey have no time to attend to the proceedings of their Legislature, and it is quite probable that some barbarous laws will be enacted before they are aroused.

The pressure of intelligent public sentiment of all parties in Boston for the retention of Gen. Corse as Postmaster has become so strong that both Senators Hoar and Dawes are said to have yielded to it, and to have recommended his reappointment to the President. Their course in doing this has greatly exasperated the Machine Republicans of Boston, and they are multiplying their efforts to convince the President that the future of the Republican party in Massachusetts hangs upon the appointment of a Republican as Postmaster of Boston. They admit that Gen. Corse has made an almost ideal Postmaster, but he is a Democrat. The President, as represented in many recent White House interviews with delegations from various States, is strongly inclined to the view that no man but a Republican should hold office, and the attitude of Senators Hoar and Dawes must cause him great perplexity, if not positive pain. He has a natural sympathy with the Massachusetts Republican leader who said, in reference to this Post-office controversy, that he "was not voting the Republican ticket every time for the sake of keeping the Democrats in office."

The decision of Judge Wallace, in the Circuit Court on Monday, that any American may take and sell for his own profit all that goes under the name "of the ninth edition of the Encyclopædia Britannica," provided he does not use articles therein written by Americans—an infinitesimally small portion of the whole—is doubtless good law, and yet we trust there is not one honest man or woman in this community who will read it without a blush of shame and indignation. It means that American jurisprudence sanctions and even protects the wholesale, deliberate, advertised theft of the fruits of another man's labor and capital, provided that other man be born under a foreign flag. It is, therefore, a decision which, without meaning any disrespect to the learned judge who delivered it, ought never to have been heard from any tribunal but that of an Algerine Cadi in the old days of the Corsairs. It actually makes mockery of our religion and of our morality, and brings disgrace on our courts and Legislature. Of course there are plenty of Gallios among us who think it injudicious to say these things lest the thieves should get angry and steal more than ever. But theft and brigandage were never yet suppressed by soft-sawder. They have been always put down by the anger of honest men and the shame and sorrow of religious men.

The Waterbury *American* has construed our remarks on the recommendations of the Board of Arbitration of this State touching the railroad service, as concurrence in the Board's plan of settling differences between the officers of the road and the employees. Their suggestion was that these differences should be referred to the decision of a State board of arbitration, and the *American* points out, justly enough, that this Board would probably be in most cases a political body, with strong leanings towards "the poor man" and against "the bloated corporation," and that under these conditions the maintenance of discipline would be impossible. We had no intention of giving in our adhesion to this particular part of the arrangement. What we recommended was the general reorganization of the railroad service on a semi-military basis, like the Police and Fire Departments. If railroad corporations had, whenever they wished to dismiss a man for incompetency or misconduct, to go outside to a political board for permission, their service would not be organized on a semi-military basis, but rather on what we should call a bunkum basis. As in the military, police, and fire services, the offences of railroad employees would, under the plan we have suggested, be in trifling cases punishable summarily by the immediate superior, in graver cases by some sort of tribunal like a court-martial within the service. This, however, is a matter of detail. What civilized communities demand and will have is, that men who have voluntarily taken charge of great lines of communication, and have the lives, health, and happiness, and business interests of millions largely dependent on their fidelity, shall not be allowed to abandon their trains and switches and telegraphic instruments suddenly and without notice, on their mere whim or caprice, or in a gust of passion or delusion, any more than a sailor is permitted to refuse duty in a gale at sea, or a soldier to throw down his rifle in the presence of the enemy. The thing is preposterous on its face, and cannot last much longer.

The interview with Sir John Macdonald, the Premier of Canada, which was published the other day, on the subject of a commercial treaty with the United States had a note of shrillness which is rather unusual with that statesman. "It means annexation, that is, treason," said the excited statesman of the Dominion. Sir John is the leader of the high-tariff party as well as of the Conservatives, and, like our own high-tariff leaders, he sees how helpful it may be at times to "wave the bloody shirt." Commercial freedom is becoming popular on both sides of the line. So, on our side, the frightened protectionists cried out in the last Presidential campaign, "Rebel brigadiers!" and they actually saved a good many votes in that way. Since the passage of the McKinley Bill and the tremendous rebuff that they received in the elections, they have been trying to pass a Force Bill, in order to turn public attention away from the tariff and to bring back the rebel brigadiers as a political issue. This thought was probably running in the mind of Sir John when he called commercial union with the United States "annexation, that is, treason." We had reciprocity with Canada ten or twelve years without any symptoms or talk of annexation. Reciprocity was not technically commercial union, but if it had been such, the political consequences would have been in no wise different.

MR. WINDOM'S LEGACY.

THE death of Secretary Windom in this city on Thursday was one of those fatalities which shock us more by their suddenness than by their calamitousness. Mr. Windom had filled high places and enjoyed large honors, and was well on toward the Psalmist's period of life, being in his sixty-fourth year. Yet he appeared to be at the maximum of his powers, and he certainly occupied a place not easy to fill. Being cut off in an instant of time, without a premonitory symptom, so far as the public had any knowledge, his loss is more deeply impressive than if he had succumbed to some lingering illness. Yet all of us who survive him for some brief space would, upon reflection, prefer to go as he went rather than to yield life inch by inch.

Mr. Windom was one of those useful average statesmen who are necessary to all countries, and who keep things going in about the right way from generation to generation. He had twice filled the office of Secretary of the Treasury, and in both instances creditably. On the first occasion he accomplished what was then a considerable feat of financiering, although now it is looked upon as commonplace enough. He funded a portion of the public debt bearing 5 per cent. interest into 3½ and 3 per cents, without new borrowing, without even printing new bonds, and without losing the Government's option to redeem them at any time, by simply stamping a few words upon them. This operation involved questions of constitutional law as well as of finance. Although the operation now seems very simple, it was not so at the time when it was performed. Therefore Mr. Windom created a precedent of some magnitude, which has the force of law for all coming time. It is not given to many Secretaries of the Treasury to do this. He has linked his name with a method of public finance which will be useful whenever in the future like circumstances shall arise.

His usefulness was proved in another way when Mr. Harrison came to make up his Cabinet. At that time Mr. Windom had taken up his residence in New York, and had become engaged in business here as one of the promoters of the Broadway Arcade Railway. He had separated himself from the State of Minnesota, whose Senator he had formerly been, and from the line of political preferment. Probably nobody was more surprised than himself when he was called to take the second place in the Cabinet at Washington. His selection, after Mr. Allison had declined the place, was a matter of sheer necessity on the part of the incoming President. No political faction was placated by his appointment. No geographical section was flattered by it. He was the only man of sufficient reputation in both politics and finance who could be induced to take the place; and, as we have said, he filled the office a second time creditably. We have had occasion to differ from him seriously now and then, but we recognize the fact that, even if his policy was open to question at times, the difficulties which beset him, which were more political than financial, were extremely perplexing, especially those relating to silver and the tariff.

The last words that Mr. Windom spoke were an earnest and very emphatic protest against the introduction of the silver standard—that is, against the Free-Coinage Bill. This is his last will and testament, his legacy to those who come after him in the high office he held, and to his fellow-countrymen. His words on Thursday evening are weighted with peculiar significance, because they must be taken as the settled policy of the President. A Secretary of the Treasury speaking on that theme must be assumed to represent the Administration. Therefore, for all purposes of advertisement to the country, it is the same as though Mr. Harrison himself had spoken. What Mr. Windom said on this subject has been said by others before him, perhaps—there is not much room for originality now, after the flood of discussion that has been poured forth during the past fifteen years. But nobody has put the matter in fewer or better chosen words. Here is a single paragraph which ought to be read and pondered by everybody who is capable of reasoning on the subject at all:

> "Would our own people await the arrival of these silver argosies from Europe before acting? Not unless the Yankee has lost his quick scent of danger and forgotten his cunning. Bank depositors, trust companies, the holders of United States notes and gold certificates would instantly lock up all the gold at command, and then join the panic-inspired procession to the Treasury, each and all anxious to be in time to grasp the golden prize before it was too late. Probably before the swiftest ocean greyhound could land its silver cargo at New York, the last gold dollar within reach would be safely hidden away in private boxes, and in the vaults of safe-deposit companies, to be brought out only by a high premium for exportation. This sudden retirement of $60,000,000 of gold, with the accompanying panic, would cause contraction and commercial disaster unparalleled in human experience, and our country would at once step down to the silver basis, when there would be no longer any inducement for coinage, and silver dollars would sink to their bullion value."

There must have been one thought in the Secretary's mind back of this which he did not utter, and that is, that the only way for the Government to keep any gold would be to suspend the payment of it. In other words, the only way to avoid suspension would be to suspend. It would be as well to stop paying at the beginning of a run as at the end of it.

PARTY LESSONS FROM CONNECTICUT.

THE dispute over the Governorship at the Connecticut State capital has, on the whole, grown steadily more bitter and involved since the Legislature met four weeks ago. Not the slightest real progress has been made in any direction towards a settlement, and the result of a vast deal of partisan finesse and gesticulation has been an approach, not towards a point of agreement, but towards the point of actual collision. But whether that collision is to come in the form of violence or in the shape of stoppage of legislation and tying up State funds, or is at the last moment to be luckily avoided, the case as it stands offers some serious warnings. One cannot see an old and law-abiding New England State forced thus to a position which lacks only the presence of Federal troops to remind us of Louisiana during the last two years of Grant's Administration, without finding certain elements in the case full of instruction, and, it may be hoped, ultimately profitable to our statesmen.

The first and most resonant warning is the one to State constitution-makers against making the organic law of their commonwealths too inflexible. That State constitutions should not be changed as easily as the statutory law is a truth manifest enough, but there is equal or perhaps greater danger in the other extreme. The latter is the trouble with the Connecticut Constitution. Adopted at a time (1818) when the Connecticut towns, as compared with to-day, were equal, it made absolutely no provision for the differential growth of those towns and the unequal distribution of party strength in towns of varied size. The Connecticut Constitution-makers of 1818 little foresaw the time when New Haven would have, say, 150 times the vote of the town of Union, while each would be sending two representatives to the General Assembly. Still less did the old Federalist or Democrat descry that in 1890 the Democrats of the State would poll some 5,000 majority in twelve Connecticut cities, which majority would be almost wasted in choosing State officers or Federal Senators. Least of all, perhaps, did he forecast that the system which he was creating would so become the vantage-ground of a minority party as to make that party stoutly resist any reform. Accordingly those old constitution-makers went on, and, by providing, as the only means of altering their work, for a majority vote in the lower house of one Legislature, a two-thirds vote in both houses of the Legislature next following, and final submission to the people, practically locked the door on any constitutional change as to which the two leading parties might divide. Constitution-makers have often made mistakes to be demonstrated by time and the change of material conditions, but in no State, we believe, have they left those mistakes so exceedingly difficult to correct as in Connecticut. The warning against adopting constitutions too iron-bound is clear and emphatic.

A second lesson from Connecticut is the extreme unwisdom of allowing partisan bodies, and particularly State Legislatures, to be "returning boards" for votes. Altogether the two houses of the Connecticut Legislature have thus far divided some twenty or thirty times on matters pertaining to the count of the votes, and each time on party lines. If one party had had control of both houses, there would have been no broil, but there might have been great injustice. As it is, with one party controlling the Senate and the other the lower house, there has been for a month an absolute and obstinate deadlock of which the end is not yet. Large bodies like State Legislatures, indeed, have all the party irresponsibility which goes with numbers. Chosen as party representatives and easily susceptible to the party lash and the control of leaders, it is hard to imagine a group of men less fitted to pass quietly on

facts and the law. If we are not to have the experiences of Connecticut repeated in other States after close elections, wise statecraft surely dictates that there must always be an appeal to the courts, even with the evils to those tribunals which follow political decisions; or else, what may seem better, some State canvassing body containing, as nearly as may be, an equal number of party representatives, with power to add an arbitrator in case of obstinate difference. Not often, fortunately, are the functions of such a body important; but now and then, when a handful of votes tells the story of a Governor, a Federal Senator, or even a national President, won or lost, its duties become extremely momentous.

A third lesson, to which we have heretofore called attention, may be derived from the working of the Connecticut Secret Ballot Law, to which the present trouble must be chiefly attributed. As discussion and investigation in the State Legislature have gone on, the obscure cases arising under that law have been multiplied, and one branch of cases alone—that of duplicated votes in the envelopes—reaches to no less than 80 out of the 168 towns in Connecticut. If the law and the equities were to be absolutely determined, it would probably mean the endless task of overhauling the ballot-boxes in the two hundred or more voting-places in the State. The significant thing is, however, that practically all of these cases have arisen entirely from letting the parties handle the ballots. "Doublet" ballots, "marked" ballots, "unsealed" envelopes, envelopes "not endorsed," and all the other causes of rejected votes would have been absolutely avoided by simply adopting the Australian plan, with its genuine State ballot. States, like Maine and others, where the politicians are striving to emasculate proposed ballot-laws, can take this Connecticut experience as a most solemn and timely warning.

The final suggestion from Connecticut is its addition to the general stock of events which signal the moral decline of the Republican party. We see there one of those old Yankee commonwealths where the Republican party was born and cradled in the "moral ideas" of the anti-slavery conflict, which gave us then such men as Buckingham and Ferry in the forum and Sedgwick and Terry in the field. Yet now, in the later and more degenerate days of the Republican party, we find it resisting constitutional reform; sending to the Federal Senate, to favor force bills, Platts and Hawleys, who themselves hold their seats because of disfranchised votes; over and over again putting in minority State officers, and willing now, for the sake of a Governorship, to plunge the State administration into chaos; violating even the antiquated Constitution behind which it has been intrenched, approving a legislative report that is a satire alike on fairness and on mathematics, and, thus far, refusing to seat a candidate whose constitutional majority is unquestioned by anybody. If we add the stained personality of Governor Bulkeley, the first violator of the Secret Ballot Law of the State, as chosen leader of the party in Connecticut, we obtain a picture of Republican party debasement from which its good deacons and church-goers may well turn away to the seclusion of their closets.

THE PROSPECT OF THE ENGLISH GENERAL ELECTIONS.

MR. GLADSTONE is justified in attaching great importance to the result of the recent bye-election at Hartlepool. The outcome of that election tends to show that the scandals and quarrels in which Mr. Parnell has been involved have not arrested the "flowing tide" of Liberal progress. If that tide be not arrested, it is as nearly certain as anything in the future of politics can be, that, at the next general election, the Conservative and Liberal-Unionist coalition will lose its majority. The more closely the course of political events in Great Britain during the last four years is studied, the stronger becomes the evidence of the volume and direction of the movement of opinion against the present Government. No one of the members of Parliament elected four years ago as a Gladstonian has gone over to the Unionists. Four members, viz., those for the Barnard Castle and for the Jarrow divisions of Durham, for the Wilton division of Wiltshire, and for Linlithgowshire, classed as Unionists when elected, are now back in the Liberal fold. The Conservative member for Deptford and the Liberal Unionist member for West Edinburgh, upon their conversion to home rule, took the Chiltern Hundreds. The latter stood, and was re-elected, as a Gladstonian.

There have been 45 contested bye-elections since September, 1886, in British constituencies which were also contested at the general election of 1886. The total Home-Rule vote in these constituencies in 1886 was but 131,451. At the bye-elections it was 164,818, a gain of 33,367. The Unionist vote rose in the same time from 139,227 to 150,051, a gain of but 10,824. The net Home-Rule gain was thus 22,543, or at the rate of 500 to each borough or division. At the general election of 1886, the majority in each of 161 constituencies was less than 500. If the ratio of gain made in the bye-elections shall be maintained at the next general election, the Gladstonian triumph will be decisive.

The practical result of the bye-elections in the transfer of seats from Conservatives and Unionists to Home-Rulers has been even more marked. There have been, since September, 1886, elections held for ninety-nine Parliamentary seats (although, since, as at Burnley and at Ayr, the same seat has become vacant more than once, the total number of bye-elections has been somewhat larger). The following table shows the political opinions of the members returned for these ninety-nine constituencies at the last bye-elections, at the election of 1886, and at the election of 1885, before the Home-Rule issue divided the old Liberal party.

BYE-ELECTIONS.

	Lib. H. R.	Irish Nat.	Lib. Un.	Con.
England	25	..	2	33
Wales	7

GENERAL ELECTION 1885.

	Lib.	Irish Nat.	Con.
England	21	..	39
Wales	7		
Scotland	9	..	2
Ireland	..	17	4
Total	37	17	45

The Home-Rule Liberals have gained sixteen seats, the Liberal Unionists have lost six, and the Conservatives ten. These gains and losses are net. Irish Nationalists were elected at the bye-elections for all the seats previously held by that party. The result of the 99 bye-elections, therefore, was that, of the 58 Conservative and Liberal-Unionists' seats, no less than 17 were captured by the Liberal Home-Rulers, while of the 41 Home-Rule seats which became vacant the Unionists were successful in but one. A similar percentage of gains at the general election in the constituencies in which bye-elections have not been held would give a Home-Rule majority of between 80 and 90 in the next Parliament.

If the comparison of the results of the bye-elections be made with those of the general elections of 1885, the indications are still favorable to a large Home-Rule majority whenever a new House of Commons shall be chosen. It is true that the results of the polling at the bye-elections show that the Liberal-Unionists are still numerous enough to manifest their strength in some constituencies, but the combined Liberal and Home-Rule majority in the House elected in 1885, ranging as it did from 160 to 170, was large enough to permit some decrease of Liberal strength and still insure a comfortable Liberal majority.

But if we go a little further, there will be still more reason to predict such a result. We find that, in spite of a loss in the popular vote, the Liberals and Home-Rulers have at the bye-elections actually carried more seats than they did in 1885. These 99 constituencies were in 1885 represented by 45 Conservatives, as against 38 Conservatives and 4 Liberal-Unionists now, and by

87 Liberals and 17 Nationalists, as against the same number of the latter and 40 of the former to-day. This winning of more seats by less votes is of course partly due to accidental circumstances, but partly to a cause which is likely to exert an influence in the general election. If the constituencies which gave a Conservative majority in 1885 be examined separately, it will be found that the Home-Rule Liberals were at the bye-elections actually stronger in them than were the united Liberals in 1885, before the party split over Mr. Gladstone's Home-Rule and Land-Purchase Bills. Thus, in the 31 British constituencies which in 1885 gave a Conservative plurality and were contested both in that year and at bye-elections subsequent to September, 1886, the Conservative vote in 1885 was 111,263 and at the bye-elections but 107,54 —a loss of 3,723; while the Liberal vote in 1885 of 86,617 rose to a Home-Rule vote of 89,490 at the bye-elections, a gain of 2,873, or a net Home-Rule gain of 6,596. Twenty out of the 31 constituencies showed Home-Rule gains. On the other hand, out of 29 constituencies which in 1885 gave Liberal pluralities, no less than 25 showed Conservative or Unionist gains at the bye-elections. The total vote in these 29 constituencies was, in 1885, Conservative 84,888, Liberal 129,371; at the bye-elections, Conservative and Unionists 98,683, a gain of 13,795, and Liberal 119,917, a loss of 9,454, or a net Liberal loss of 23,249. It is evident, therefore, that for some reason —the dislike to the fusion with a minority of the opposite party, so common among the lower ranks of all parties everywhere, the rise of social and labor questions into increased importance, the usual tendency to turn against the party in power, an actual conversion on the subject of Home Rule, or what not—there is a movement of Conservative voters away from that party towards the Home-Rule Liberals.

This movement is obscured in constituencies in which the Liberal vote was originally very large by the fact that the Unionist Liberals, while less numerous than in 1886, are still more numerous than are the Conservative recruits to Home Rule. It so happens, however, that a considerable falling off in the Liberal vote in the constituencies which in 1885 gave Liberal pluralities, may be less disastrous to that party than a much less shrinkage in the Conservative constituencies would be to the latter organization. In 1885 the greater part of the constituencies carried by very small majorities returned Conservative members. From every possible point of view, it is clear that unless recent events have checked it, the "flowing tide" is running in fast enough and strong enough to sweep the Salisbury Government from power whenever the general election takes place. If it shall turn out that a check has been given, it is historically all the more important that the failure of the effort to give Ireland the control of its own Government shall not lead future students to think that the movement never was in a fair way to succeed.

QUALITY OF OUR LATEST IMMIGRATION.

THE official figures of the immigration to this country during 1890 reveal some striking changes in the nationalities of the new arrivals from those of previous years. In round numbers the total immigration of the year was 491,000, or a gain of about 64,000 over that of the preceding year. Nearly half of this total gain came from Italy alone, for the number from that country exceeded 62,000, and was nearly 33,000 larger than in 1889, a gain of more than 100 per cent. A smaller numerical but larger proportionate gain was shown by Poland, which sent nearly 20,000, against less than 5,000 in 1889. Other countries showing gains were Hungary, over 9,000, Russia over 7,000, Austria over 6,500, and Bohemia over 5,000. In fact, the total gains from these countries aggregate about 76,000, or 12,000 more than the net gain on the entire immigration from all countries combined. There was no material gain on the German and Scandinavian totals, which remain about the same, and there was a considerable falling off in the English, Scotch, Irish, Netherland, and Swiss. The German still leads all others, standing at about 96,000, but the Italian has gone ahead not only of the Swedish and Norwegian, but of the Irish, and stands next to the German.

For the first time in the history of the country the number of Italians entering it exceeded the number of Irish, and also exceeded any previous Italian total in a single year, the nearest approach to the 62,000 of 1890 being the 47,000 of 1888. The Irish total for 1890, a little over 53,000, is below that of any previous year, with two exceptions, since 1880. A lower limit was reached in 1885, when less than 50,000 came, and again in 1886, when less than 53,000 came. All the countries, except Italy, which show gains are those of Slavic races, the immigration from which has been regarded hitherto as the least desirable of all that has come hither, while all the countries which remain stationary or show a falling off are those from which the most desirable foreign additions to our population have been drawn for the past quarter of a century. These are large general facts which may well call for serious consideration.

There are special causes for this increase in the Italian and Slavic inflow. The Italians are brought here in response to demands from this side of the ocean for a class of laborers who will work at low prices and will not be led into strikes. Those of them who come from the northern and central portions of Italy are usually strong, powerful men and women, sober, industrious, and moral, and capable of enduring great fatigue. This estimate of them is quoted from the report of our former Consul-General at Rome, Mr. Alden. Those coming from southern Italy, according to the same authority, are less desirable.

The large increase in Polish immigration is due entirely to the persecution of the Jews in Russia. Some of this immigration is of excellent character, and some of it is quite the reverse. It has been directed to this country through the exertions of Baron Hirsch, and the most serious question in regard to it has been that of a proper distribution of the new arrivals throughout the country. A Hebrew society in this city, which is working in connection with the Baron, is considering the matter, and a solution is looked for within a short time.

The countries which contribute most heavily to the Anarchist population of our large cities are Austria and Bohemia, and, though those countries send us some industrious immigrants who become desirable citizens, there is good cause for uneasiness in the rapid growth of additions from those quarters. The large increase in Hungarians is due almost entirely to the importation of large gangs of them by the miners and manufacturers of Pennsylvania and other States, who have substituted them for other laborers who struck for higher wages. They have many of the characteristics of Chinese laborers, working very cheaply and living upon very meagre fare. For their presence in the United States, the American laborer has to thank the protected manufacturers and other loud-mouthed friends of American workingmen.

The most serious aspect of the immigration statistics is the evidence they give that the tide of German, Scandinavian, English, Scotch, Dutch, and Swiss arrivals has been checked. These nationalities have always furnished the most desirable additions which have been made from alien soils to our population. Their representatives are frugal, industrious, of good average intelligence, and the great majority of them come to this country to make homes for themselves and become citizens. They have built up thousands of acres in the Western States, changing them from a barren wilderness into fruitful farms. They become householders almost from the moment of their arrival, and from the nature of the case become also law-abiding and useful citizens. It would be a sad change for the American people if there were to be a steady decline in the number of recruits to our citizenship from these countries, and a steady gain from the countries which showed an increase last year, but it would at present be premature to fear such results. The inflow from the desirable sources has not been stopped. It is still very strong, and its quality remains undiluted. Neither is there much reason to fear that the increase from the undesirable sources will be maintained. Much of it is undoubtedly temporary, and reasonable and perfectly legitimate and practicable restrictions will be sufficient to keep it within the bounds of safety.

LOOSE LEGISLATION IN FRANCE.

THEY do not always do these things better in France. Under the Empire the phraseology of all bills passed by the Chambers was closely scrutinized by the Council of State, and pains were taken to make laws clear and precise in their terminology, consistent with themselves, and in harmony with existing statutes. With the coming in of cruder

methods, too much like our own, under which every Deputy can put any sort of an amendment into a bill in any sort of language, if he can get votes enough, some curious specimens of carelessly drawn legislation, with the resulting tangles of judicial interpretation, have got into the statute-books. One such would appear to be the famous law on "syndicates," or associations of workingmen and others, passed March 21, 1884. It was designed primarily to benefit trades-unions, and under its terms public works in the city of Paris have been repeatedly let to such organizations. But the law was much debated through several sessions before getting final enactment, and came to be a composite affair before all was done. For example, the right of association was extended expressly to farmers and merchants, and the law vaguely spoke of those who had "financial interests" to defend as also entitled to the privilege. Can members of the liberal professions associate under the law? The courts have said no and yes.

The physicians of the Department of Orme formed an association for mutual protection, under the terms of the law, and in that capacity brought a suit for damages against a man who was illegally practising medicine within their preserves. His defence was the technical one that the association had no legal standing in court, as it had no right to exist under the authority conferred by the law. The lower court so held, as did also the next higher tribunal, and finally the Court of Cassation. The doctors, therefore, got nothing but the heavy bill of costs for their suit. This decision was supposed to settle the law, and to exclude from its benefits all but workingmen, farmers, and merchants. However, in 1889, an association of teachers, mostly connected with religious institutions, was formed, but was ordered by the Minister of Public Instruction to dissolve, as being illegal. But it was shown that a similar association, of a personnel more agreeable to the Minister, had been allowed to exist for three years. Finally, a third teachers' organization was formed, and resolved to test the matter in the courts. Thereupon the Tribunal of the Seine reviewed the case, and came to the conclusion that the law really placed no restrictions upon the right of association, thus leaving all again in delightful uncertainty.

Another ambiguity of the law has left it doubtful whether an association can sue in its corporate capacity. The Paris courts have held that it can, but a recent case in the Department of Aix sets a different precedent. An association of merchants at Nice brought a suit for damages against a fellow-tradesman for the curious offence of having advertised a sheriff's sale in too flaming a manner. He had filled the town with "dodgers," and covered all the dead-walls with posters, seting forth the immense advantages of being present at the sale ordered by the court, where goods were to be had at any price. This was a gross injury to the business of the conservative merchants, who saw their shops deserted in consequence, and hence the suit. The guilty man could not deny the crime, but rested his defence on the legal inability of the association to sue as a corporation. The lower court at Nice overruled this, but the Aix Court of Appeals sustained the objection, and threw the case out. The defendant placed much reliance upon citations from the debates in the Chambers, especially from a speech of M. Waldeck-Rousseau, Minister at the time, who declared that it was not intended to give any such right to the "syndicates." By thus going outside of the terms of the law to arrive at its intent, the Court decided that the association could not sue, and that the only remedy left the injured merchants for the wrong they had suffered —a wrong which appears to be admitted on all hands to be grievous—was a series of individual prosecutions.

THE WINTER EXHIBITION AT THE ROYAL ACADEMY.

London, January 10, 1891.

That the twenty-second winter loan exhibition of old masters, lately opened at the Royal Academy, is uninteresting, as a whole, is hardly a matter of surprise. Many as are the fine private collections of England which for twenty-two seasons have contributed to the winter show at Burlington House, they are not inexhaustible, and this year it looks as if the end of their resources had been reached.

The present exhibition contains no such brilliant series of masterpieces as the Velasquezes and Rembrandts of last winter, and comparatively few single pictures of note. It is, indeed, successful chiefly in showing what indifferent work could be produced in a so-called great age of painting or by a really great painter. The examples of the primitive schools of Italy, Holland, and Flanders do but give an eloquent contradiction to the Ruskinian theory of the artistic value of religious motives, and prove that only too often the painting of Christs, saints, and Madonnas was the most perfunctory task. Even in the ages of faith, as now, there were a few great masters and a multitude of feeble imitators; and unfortunately it is the latter who are here represented, though one or two pictures by Memling and Mabuse are very decorative, and though there is a little Madonna by Mantegna which, while it is inferior to his best work (I believe it is questioned whether it should really be attributed to him), is admirable in the foreshortening of the figures, and beautiful in its Blake-like arrangement of scarlet and golden angels in the background.

Of the foreign masters of a later date, only two have been brought forward with prominence, Velasquez and Franz Hals. Of the former there is nothing that can quite equal the Venus of last year; but then, on the other hand, nothing in the exhibition can approach the three portraits by him which now appear. The most striking is the small full-length of the Duke D'Olivarez on horseback, tremendously strong in its rendering of character, fine in the color of the crimson scarf and the sheen of the armor, and full of life in the action of the rearing horse. Besides this, there are one of his twenty-three variations of that very paintable Philip IV., this time in royal red, and an Infanta Maria Theresa as a child in quaint court dress, black over great hoops, a wide lace collar, and a red cap, standing by a chair where a little spaniel is curled up, his face looking out of the canvas; costume and chair and dog all suggested as no one else could have done them, though the face of the Infanta was probably painted by another artist, so little is it like the work of Velasquez.

The six examples of Franz Hals are less satisfactory. None can compare to the portrait in the National Gallery; all are rather black, and one or two have apparently been restored, to their irreparable loss. But Franz Hals, even at his most indifferent, could not be commonplace; and "Le Joyeux Buveur"—his jolly carouser, smiling in drunken good humor, glass held high, lute clasped tight by a hand that can no longer steady it—and three portraits, hanging together in the centre of one of the smaller rooms, completely kill the little Flemish and Dutch cabinet pictures by which they are surrounded. Studied singly and apart, many of these, especially wonderful interiors by De Hooghe, Meer, and Terburg (who were already preoccupied with what we usually suppose are wholly modern problems of light and perspective), would be altogether delightful. But their almost microscopic qualities can never be appreciated in a large gallery under any circumstances; when contrasted with the broader, more artistic methods of a master like Franz Hals, they show to the very worst advantage.

British artists have fared but little better. In the Royal Academy of late years, in the New Gallery and the Grosvenor, Sir Joshua and Gainsborough and Romney have again and again been much more adequately represented. Portrait-painting to the eighteenth-century artist was not infrequently as perfunctory work as Madonna painting was to the Pre-Raphaelite, and royal and noble sitters had as paralyzing an effect as church patrons. Even Sir Joshua could not always escape this deadening influence, and only a couple of portraits — one of himself, another of Robert Mayne—and a charming study of a "Nymph, with Boy Piping," would give the person who knew nothing of his work an idea of his mastery of beautiful color and composition which ranks him only second to the great Venetians. There are Gainsboroughs in which the drapery is rendered with a freedom and vigor not unworthy of Velasquez, while the face has been elaborately finished until all art is worked out of it. The Romneys one would willingly pass without a second glance, with the exception of his incomparable "Mrs. Carwardine and Child." This picture has been exhibited before, at the Grosvenor, if I am not mistaken, and it has been engraved. It is a simple and exquisite version of a subject which, with the old Italians, was overweighted by its religious interpretation, and with the modern artist is degraded by Christmas Annual sentiment. But Romney treated it with a realism delightful in its sincerity and free from the affected straining after prettiness but too often marked in much of his work. The composition is as fine as in the most celebrated Madonnas—the child clasped in the mother's arms, her face softened by the delicate white cap pressed close to the little head; and both figures are well modelled and solidly painted. But the chief charm is the color, rich and glowing, which even an ugly note in the red of the chair cannot mar.

The most notable British portrait, however, is really Hoppner's "Mrs. Gwyn, the Jessamy Bride." It would be a masterpiece whoever had painted it; coming from Hoppner, whose work rarely rose above mediocrity, it is a revelation. In it he seems for once to have thrown tradition to the winds, and to have recorded his own impressions in his own way. Mrs. Gwyn, in a white gown, a bit of blue around the waist, and a powdered wig, is sitting, her arms folded in her lap, under a tree. The

composition is the simplest; it is in the execution that the artist surpassed himself. The face and hair and dress are sketched in with infinite freedom and knowledge, the color is as lovely as in a Romney, while in his large, effective treatment of the foliage in the background he seems almost to have anticipated Monet.

Of the British landscapes there is nothing special to be said. The selection does but scant justice to Crome; there is but one small Constable; the single Bonington is not a very good example, and the Turners vary from a big classical composition to two scenes in the Park at Lowther Castle, which still give a fine effect of distance, and probably were good before the color faded from them.

To lend an element of novelty to the exhibition, two galleries have been set apart for a distinct collection, illustrating, as the title-page of the catalogue explains, the progress of the art of water color in England. This is perhaps the most interesting, if the least artistic, section of the show, and it is certainly the most timely. We have heard a great deal of late about the "national" art of water color, for, in his patriotism, the true Briton has not yet discovered that art knows no nationality. We are told, with a repetition which grows wearisome, that this is the medium in which British artists are supreme; and, according to the new gospel, Reynolds and Romney, Gainsborough and Constable, sink into insignificance by the side of Samuel Palmer and David Cox, William Hunt and John Frederick Lewis. Men who own many drawings by these masters of insular reputation are crying out aloud against the iniquitous indifference of the nation; they would organize a crusade against the National Gallery, and ruthlessly strip from its walls what in their facetiousness they call "squint-eyed Byzantine saints" by Italian intruders, and "scraps of Constable," who was but a painter in oils, in order to find a place for water colors by English artists who have not as yet been honored in their own country. Or they would gladly set up a new temple of British art, in which British water color could assert its supremacy. The gain to the nation, they maintain, would be great. But the profit to present owners of the despised drawings for which they cannot find a paying market, would be unquestionably greater. For the dealer, professional or amateur, there is no better customer than the Government.

But so far the Government has not availed itself of the opportunity for enriching private subjects at the expense of the nation with the celerity it showed in the case of the Duke of Marlborough's Raphael. An exhibition elsewhere of representative examples of the "national" art comes, therefore, at a most opportune moment. At the Royal Academy one can now see the genuine British work to which it has been calmly proposed to sacrifice a great portion of the treasures of the National Gallery. It must be confessed that the study of this work speedily reconciles one to the indifference of the nation. With some very conspicuous exceptions, the present collection of water-color drawings is even more devoid of artistic importance than the annual show at the Institute. The earliest, in point of date, in the series are more primitive than the most primitive squint-eyed Byzantine saints, and are remarkable for nothing but the absence of every artistic quality. Paul Sandby, Michael Angelo Rooker, Thomas Girtin, John Varley, are names known only to the few, and the many may willingly continue to remain in ignorance. The first of the water-color painters who put any brilliancy, color, or "go" into his work was John Sell Cotman, for whose sketches and studies wall-space might profitably be found in any great gallery, British, Continental, or American. With his exquisite cloud effects, his beauty of line, his brilliant color, and, above all, his fine technical qualities—his simplicity and breadth—he stands head and shoulders above his niggling contemporaries. After him come David Cox, whose work is often enough niggled and messed, though occasionally he rises to larger methods; Turner, who here is seen at his most commonplace, there being nothing so good as his Swiss and Italian sketches, which are just now exhibited for the first time in the basement rooms at the National Gallery; Peter de Wint, sadly mediocre; William Hunt, a true British sentimentalist in his subjects, who worked carefully and conscientiously, but who was without the least artistic sense; Samuel Prout, chromo-like in his most telling effects; Samuel Palmer, who lacked the power of giving artistic expression to his really fine poetic feeling for nature; John Frederick Lewis, whose study of detail was marvellous, but whose technique was atrocious. Three lovely little Boningtons break this long uninteresting series; in their crispness, their brightness, their out-door atmosphere, their successful rendering of an impression by the simplest means and without the least suggestion of painstaking but misdirected labor, they, by the contrast, do but emphasize the inefficiency of the Hunts and Palmers and Prouts.

The last of the list is Frederick Walker, who holds a place, as it were, alone. For while he, too, unlike Cotman and Bonington, elaborated his details and worked everything out to the last degree of finish—while to really see all that he has put on his paper one must use a magnifying-glass—he had a keen artistic perception, and, by his own plodding methods, in the end succeeded in getting what he wanted. His color is often very rich, his draughtsmanship good, his figures beautiful in line and pose. But as a whole, and looked at from the least distance, his drawings are far from satisfying; and often when you do study them microscopically, you find a curious carelessness in the very details to which he apparently devoted all thought and energy. In the "Harbor of Refuge," the most important work, the man is mowing with the scythe in his wrong hand, and daisies are wide open long after sundown. How an artist who seems to have studied his subjects so seriously could make such blunders, is unaccountable. Similar blemishes occur in other pictures.

Here also are the "Wayfarers," the "Girl Driving Geese," the "Vale of Rest," the "Ferry," so well known by the etchings. I had never seen the originals before, and at first could not understand my disappointment. But the truth is, the reproductions simplify the effect of the drawings to a certain extent; the details of color at least are left out in the black-and white copies.

If this collection really does illustrate the progress of water color in England, then it proves very conclusively that, from Cotman to Fred Walker, the art made no advance. Nor has there been much improvement from the time of Fred Walker to our own day, except in the marvellous work now being done by the younger Scotchmen, by Mr. Alfred Parsons and one or two other Englishmen.

THE SCIENTIFIC WORK OF THE LATE DR. SCHLIEMANN.

ROME, January 14, 1891.

DR. CARL SCHUCHARDT of Hanover has written a book on the scientific work of Dr. Schliemann. It is a summary of the assumptions and presumptions in favor of the theories which the renowned excavator put forward touching the significance of the various discoveries he made. Now that his work is done and he himself gone from the effect of either proof or disproof of those theories, and from the pain scientific condemnation would inflict if scientific criticism should result in condemnation, it is worth while to examine impartially the evidence on the subject, and see if some definite value can be given to his discoveries.

Two facts have long been agreed on by most scientific archæologists, viz., that the Doctor, in all the interesting discoveries he has made, has not determined a single point with scientific definiteness, and that he had no conception of scientific method in his researches. He set out with the purpose of finding a particular thing, and, when he found something, decided that it was what he sought for. His enthusiasm was great and his love of classic associations absorbing, while his liberal use of the fortune he had acquired in his researches gave him a right to the honor he has received, and to the intimate association with Homer and the great Greek epoch which will always be his. But the interests of science are of greater weight than any personal merits; and while we may yield him all the credit due to the most romantic of classic discoverers, we are not thereby led to accept his conclusions as to his discoveries. That he was utterly wanting in scientific purpose and even elementary training was made clear from his first book on Homeric precincts, in which he gave the result of his researches in the Peloponnesus, Ithaca, and the Troad, where he gravely fixes the early Cyclopean ruin on Mt. Ætos as the palace of Ulysses, and the curious chambers in it, distinctly a part of the fortifications, as the pig-pens of Eumæus; identifying the decayed stump of a huge tree which stood at the corner of the citadel as the remains of the tree from which Ulysses made his bed, etc. This book proves his constitutional incapacity to perceive the indispensable characters of scientific evidence, for he sees a mutilated inscription on a stone, transcribes it so incorrectly that no sense could ever be found in it, and then puts it down as an inscription on a sarcophagus of which he gives the exact dimensions with illustrations of objects which he says were found in it. But the facts were that he only found the half of the inscription, copied it without understanding its epoch or meaning, or that it was made certainly not later than the fifth century B. C., while the coin he engraves as among the contents is a late Achaian one; moreover, as I learned in rediscovering the inscription some time after entire, it had nothing to do with mortuary records, but was a mural tablet, and, according to the declaration of the men who found it and showed it to us both, nothing was found with it, as might be expected.

The romantic sentiment so dominated all else in him that he could not recognize the value of a merely scientific datum. In his first examination of Mycenæ he found no indication of what he sought for, and walked over the graves which since have been the puzzle of the archæological world. When he first went to Troy he set to work on the hill of Bunarbashi and dug there, finding nothing, till Calvert, who had been digging at Hissarlik and had exhausted his means, advised him to continue his work there, as there were indications of finds to be made, Calvert having already made some discoveries. He discovers several strata of débris, in the third of which he

finds objects of gold and silver, whereupon he dubs *that* Troy and the find, Priam's treasure. But, digging further, he finds that there are indications of two strata of ruin underneath, and concludes that the nearest one must be Priam's Troy, the lowest being that which was destroyed by Hercules before Priam. As the identification of the site has been the principal discovery of Schliemann claimed as scientific, it will be interesting to review the evidence on the question adduced when the conditions were more favorable than they are now to a sound decision.

Strabo (Book 13, ii, 32-45) describes the plain of Troy as it was in his day, and gives us a résumé of the discussions which the attempts to determine the site had given rise to even before him. The site of Hissarlik was then occupied by the city of New Ilium, and the dispute was hot between its inhabitants and the Greeks of Hellas proper as to the identity of the site with that of Homer's Troy. With the advantage of living at the beginning of our era, when all the classics of the prior centuries were accessible and the local traditions still living, he says:

"The two plains, the Scamandrian and the Simoisian, are separated by a long spur of mountain extending perpendicularly to the point of intersection of the two arms of Ida, from New Ilium, which seems to be part of it, to Cebrenia, and, with the two arms, forming the letter E. A little above is the Ilium-Comé, or village of the Ilians, which occupies, according to common belief, the site of ancient Ilium, and is thirty stadia from the modern Ilium. Ten stadia above Ilium-Comé we reach Calli-Colone, a mountain about five stadia in circuit, and of which Simois bathes the foot. This disposition of the localities gives the most satisfactory explanation of many passages of the 'Iliad' and especially of that which relates to the god Mars: 'on the other side, coming down like the dark storm, he encourages the Trojans, now shouting with his penetrating voice from the highest point of the citadel, now running along the Simois on the ridge of Calli-Colone.' And in effect, the combat, going on in the plain of the Scamander, the poet could, without loss of actuality, show us Mars exciting the Trojans, first from the summit of the acropolis, then from other stations in the neighborhood of the city, such as the banks of the Simois and the ridge of Calli-Colone, to which point the combat evidently might extend; whereas, at the distance of forty stadia which separates Calli-Colone from New Ilium, one asks the utility of making the god pass from the summit of the acropolis to points so far away that it is evident that the combatants would never be able to reach them. This other detail, 'on the side of Thymbra is the camp assigned to the Lycians,' is equally in accord with the site of ancient Ilium, a site well known to be near the plain of Thymbra and the course of the Thymbrius, which, at the bottom of the plain, near the temple of the Thymbrian Apollo, empties into the Scamander, while the same plain is at least fifty stadia from the New Ilium."

Then follows a dissertation on the impossibility of the movements of the 'Iliad' taking place on the plain between Hissarlik and the sea-shore, all of which is of the highest interest to students of the question. Reference is also made to the extension of the land by the alluvium beyond its ancient limit, and Strabo adds:

"Demetrius [of Skepsis, a prior disputant on the question] invokes on this point the testimony of Hestius, the famous grammarian, a native of Alexandria, who, in his commentary on the 'Iliad' of Homer, asks if really the vicinity of the present city of Ilium could have been the theatre of the war between the Greeks and Trojans, and where, in that case, one must seek the plain of Troy which the poet describes between the city and the sea, since it is known that all the land before the present city has been formed at a later period by the floods of the rivers. And Polites, 'the Trojan spy, who, confiding in his speed as a runner, had come to take his position on the tomb of the old Æsyetes'—Polites on the same ground would have been a simpleton, because, though he had there a spying-place certainly very high, could, by going up on the acropolis [of the New Ilium] see the enemy from a point much higher and from almost as near, and would not have been obliged to calculate only on his quickness of foot for his safety, the tomb of Æsyetes being (and it can still be seen on the road to Alexandria) only five stadia from the acropolis of New Ilium. And finally the triple race of Hector around the city must appear equally absurd, for the rocky ridge which comes down to the present city would positively prevent the circuit. The circuit of the old city was, on the contrary, perfectly free. But it will be asked, How is it that no remains exist of the ancient Ilium? Nothing is more natural, because all the neighboring cities having only been devastated without having been completely destroyed, while Ilium had been razed to the foundations, they were obliged to take from it the very last stone to repair the others. We are assured, for example, that Archæanax of Mitylene took from Ilium all the stone he needed to fortify Sigeum, which did not hinder Sigeum from falling later into the hands of the Athenians commanded by Phrynon, who took the prize at the Olympic games.

"As to the total destruction of Ilium, which the Ilians of to-day deny, Homer expressly states it. . . . And on their side, many modern authors certify the destruction of the ancient Ilium. The orator Lycurgus, for example, having occasion to pronounce the name of Ilium, says: 'Who is he that has not heard that from the day when the city was destroyed by the Greeks, it ceased for ever to be inhabited?' It is presumed that those who later had the idea of rebuilding Ilium decided that the ancient site had become an accursed place, either on account of the misfortunes of which it had been the theatre, or on account of the curses that Agamemnon had launched against Ilium, following in that a very ancient custom, which Crœsus observed when, after having taken and destroyed Sidene, last refuge of the tyrant Glaucias, he pronounced a solemn curse against those who should ever attempt to reconstruct its walls. In any case it was always believed that it was obligatory to abandon the primitive site of Ilium, and they sought another to build the new city. First, the Astypaleans of Rhœteum chose a site near the Simois and built there Polium (or, as it is now called, Polisma); but, the position not being sufficiently strong, the new settlement was soon ruined. Later, at the time of the Lydian conquest, the present Ilium with its temple was built, but it could not be called a city, and only merited this name long after, having grown slowly and by degrees. Hellanicus, indeed, affirms that the new and the old Ilium were only one city, but this is evidently to flatter the inhabitants of Ilium, which he had always the desire to do. As to the territory which was divided after the destruction of Troy by the Sigeans, the Rhœteans, and others, it was only restored after the construction of the new Ilium."

What, then, was the mass of ruins in which Schliemann found the Troy of Homer? He believed that he could distinguish five distinct strata of ruin, indicating as many successive occupations of the site. But in the lowest of these he found constructions of brick, which was absolutely unknown in the archaic times in which Troy is supposed to have been constructed, and which was apparently a strange material in the times when the Lydian conquest took place, for it is recorded that the Greeks wondered at Crœsus building his palace at Susa with bricks. This corresponds with the statement of Strabo that the first city on that site was built in the epoch of Crœsus (Book 13, i., 25): "According to the testimony of many historians, Ilion was moved several times before fixing itself, about the epoch of Crœsus, in the locality it occupies to-day." And ibid., 27: "As to the modern Ilium, it only half merited the name of a city when the Romans for the first time set foot in Asia and drove out Antiochus the Great from all the country this side the Taurus." Here we have the first conquest, though, according to the testimony of Demetrius of Skepsis, it was then a miserable village, the houses of which were hardly covered with tiles. Strabo continues:

"Hegesianax, in his turn, relates how the Galatians, after their passage from Europe to Asia, ascended to Ilium in the hope of finding the fortified refuge they needed, but soon left it, not having even found a surrounding wall. In the succeeding time, it is true, the state of the city was greatly improved and changed, but it had much to endure from the Romans under Fimbria, who, in their war against Mithridates, laid siege to it and took it by storm. Fimbria had accompanied as quæstor the Consul Valerius Flaccus, appointed to make war on Mithridates, but once in Bithynia he excited a mutiny and killed the Consul, assumed the command and marched to Ilium, and, on the refusal of the city to admit a brigand like him, he laid siege and took it in ten days. . . . On this Sylla landed in Asia; he put Fimbria to death, and, having concluded with Mithridates a treaty which forced that prince to return to his own States, he indemnified the Ilians by according to the city important repairs."

We have, therefore, four captures of the city before the Christian era, to say nothing of what may have occurred during the subsequent wars of the Romans with the revolting tribes of Asia Minor, so that we can easily account for all the débris dug through by Schliemann. The testimony of Strabo is clear and stated in accordance with historical method, and there is no reason to reject it, for nothing in the discoveries made on the locality can be held as an argument of equal force. There is no indication, in the ruins exposed by the excavations of the Doctor, of a city of the archaic epoch, while at Bunarbashi there are remains of foundations of Pelasgic structures, examined and reported on by Hahn. Whether the site of Bunarbashi agrees with the indications of Homer is a question apart. Neither of the rival sites may be free from all objection, but the utter want of archaic work at the Hissarlik site is conclusive against it, for work of that character is found at the other and in many other places in the Troad. The city which once stood on Bunarbashi may have been that which the author of the 'Iliad' had in mind in the construction of the poem as that believed in his time to have been Troy. That on Hissarlik cannot have been, for, if there is any evidence worth weighing on the matter, it was not built till after the poem had been written, whoever wrote it. The manner of construction agrees with the indications of Strabo, and Strabo accounts for the absence of ruins at Bunarbashi, and meets all the objections which Schliemann made on that ground.

Again, taking the latest critical authority as well as the greatest in all that relates to the Homeric unities, Prof. Jebb ('Homer: An Introduction to the Iliad and the Odyssey'), the summary of the arguments is equally decisive against the Troy of Schliemann being the Troy of Homer:

"The 'Iliad' shows a personal acquaintance with the plain of Troy and with the dominant features of the surrounding landscape. In the site of Troy as described by Homer the capital feature is the acropolis — 'lofty,' 'windy,' 'beetling'—with those precipitous crags over which it was proposed to hurl the wooden horse. This suits one site only in the Trojan plain—that above the village of Bunarbashi on the lower slopes of the hills which fringe the plains to the south. Here the hill called the Bali Dagh rises some 400 feet above the plain, with sheer sides descending on the south and southwest to the valley of the Menderé [Scamander]. A little northwest of Homeric Troy two natural springs arose. A little to northwest of Bunarbashi these springs still exist, and no others like them exist anywhere else in the plain. As Prof. Ernst Curtius well says, 'This pair of rivulets is the immutable mark of nature, by which the height towering above is recognized as the citadel of Ilium.' Though the site at Bunar-

bashi has not yet been thoroughly explored, pottery has been found there which is referred to 1000—900 B. C. Since Le Chevalier's visit in 1785, the striking features of agreement between Bunarbashi and the Homeric picture of Troy—features unique in the Trojan plain—have been emphatically recognized by a series of the most competent observers, including Leake, Moltke, Forchhammer, Kiepert, Ernst Curtius, and Tozer. Leake remarked that any person at all accustomed to observe the sites of Greek towns must fix on Bunarbashi 'for the site of the chief place of the surrounding country.' The same opinion was expressed to Prof. E Curtius by Count Moltke, 'that he knew no other site in the Trojan plain for a chief town of ancient time.' The low mound of Hissarlik stands in the open plain, about three miles from the Hellespont. It measures some 325 by 235 yards, and stands only some 112 feet above the plain. This mound marks the site of a historical Greek town to which the first settlers gave the name of 'Ilium' (perhaps about 700 B. C), and which existed here down to Roman times. In the mound have been discovered (1) remains of this Greek town, (2) some prehistoric remains. Dr. Schliemann asserts that the prehistoric remains are those of Homeric Troy. If this means that they represent a town which gave rise to the legend of Troy, the assertion is one which can no longer be either proved or disproved. No objects found at Hissarlik tend in the slightest degree to prove it. On the other hand, one important fact is certain: the low site at Hissarlik is in the strongest contrast with the site of spacious and 'lofty' Troy as described by Homer, while the site at Bunarbashi is as strikingly in harmony with that description."

Space does not allow me to extract the whole of the exhaustive demonstration of Prof. Jebb that the site of Hissarlik cannot have been that of Troy, which (whether we take it as the real city of the Homeric legend or the localization of it by the author of that legend, going to the site attributed to that legendary city in search of some features which would serve for the construction of the poem, and basing the action of the drama on local study) must have been Bunarbashi. The whole discussion has this distinct result, that it makes clear Schliemann's method of demonstration, viz., that, having set out to find traces of the heroic age, when he found some objects of value he decided that this was what he set out to find. He was incapable of estimating the significance of archæological evidence, and his identification of Troy is of no scientific value whatever. If his theories were to be accepted as valid, they would make confusion of all archæology based on the character of objects discovered in similar excavations.

The same general objection may be brought against the hypothesis that the tombs discovered at Mycenæ are of Achaian inhumation. There is not a single coincidence with the recorded characteristics of the Homeric customs of burial, nor a single positive indication of the archaic or even prehistorical date of it. The recent discovery in the immediate vicinity of Mycenæ of many tombs of the tholos type, similar to the great domed tombs long known at the gates of the Agamemnonian city; the discovery in them of some classes of objects included in the miscellaneous collection found in the graves opened by Schliemann; and the later magnificent discovery by Mr. Tsoundas of an untouched and evidently royal tomb of the Achaian epoch near Spata—a tomb which, for reasons not necessary to my present argument, we must consider prior to the Dorian occupation of the Peloponnesus—give us positive data from which to commence an appreciation of the provenance of the treasures found in the Schliemann tombs and the nature of the interment itself. The fact that the principal personage in the cemetery found by Schliemann was a woman, is a positive indication of barbaric presence. The masks of gold on the faces of the dead, only found in barbaric graves hitherto; the extraordinary diversity of the objects found, some of which certainly cannot be attributed to the arts of classic Greece, and must be assigned to the later centuries of Greek nationality, if Greek at all, while some of the most important agree perfectly with those found in the tomb at Pharis; the fact that in the construction of the structures about the Schliemann tomb, and prior to it, the débris of the ancient city appear; and, above all, the nature of the grave itself, surmounted by a quasi-Druidical circle, and utterly unlike any grave of Greek custom of any epoch and especially those which have been discovered at Mycenæ—forbid the attribution of the inhumation to any Hellenic source, while they are all reconcilable with the hypothesis that the interments were those of the chiefs of a tribe of barbarians established at Mycenæ in the interval between its destruction by Argos and its reoccupation by Greeks (which the inscriptions found by Tsoundas prove to have been effected before the time of Nabis, tyrant of Sparta). These barbarians had presumably robbed the tombs around Mycenæ, deriving from them the greater part of the treasures found by Schliemann, if not the whole. Schliemann's interpretation runs against continuous insoluble difficulties, while this, especially since the late discoveries by Tsoundas, meets every fact in the case.

Remains the Tirynthian discovery, with regard to which the discussion is not yet beaten out, and in which I have taken too prominent a part to be a dispassionate disputant, perhaps. But here it is not Schliemann who is mainly in view, but Dr. Dörpfeld. To the opinions of Dörpfeld on all that relates to classical architecture as far back as architecture can be said to be an art, no one defers more completely than I; but I am no more willing to accept his decisions on a matter of prehistoric structure, a subject to which I have given many years of study, than I should be willing to oppose my judgment to his on a question of temple or theatre structure. The whole question turns on two considerations—the architectural characters of the Homeric or pre-Homeric house, the evidence concerning which is purely literary, and the material of construction. On the former I defer to those who have made the texts of the early Greek literature a special study, not pretending myself to have a judgment thereon. The following is the conclusion of Jebb's thorough discussion of the question in the "Tiryns" appendix of his 'Homer,' already referred to:

"All the Homeric evidence tends to show that the Homeric house is the prototype of the later Greek house of the historical age. A dwelling on the supposed Tirynthian plan differs from this Greek type in a vital respect. By placing the women in a practically separate house, with a separate egress, it fails to provide for their seclusion in the sense in which ancient Greek feeling required it. The space which has here been given to this subject is amply justified by its importance in two general aspects. First, the interpretation of the 'Odyssey' is reduced to chaos if these fragmentary house-walls at Tiryns, of doubtful age and origin, are accepted as at once sufficient to upset all the plainest evidence of the Homeric text. Secondly, this case is typical of a tendency which, in the interests alike of archæology and scholarship, is to be deprecated. No one questions the intrinsic interest and value of the Tiryns remains, whatever may be their date or source. Nor is the classical scholarship of the present day at all disposed to neglect the invaluable light derived from classical archæology. But when, as at Tiryns, it is sought to bring monuments into relation with texts, then the difficulties which those texts present should be either fairly answered or frankly allowed."

In another place Prof. Jebb says:

"Dr. Dörpfeld speaks with acknowledged weight when he speaks as an architect on a question of ancient architecture. But the attempt to dispose of the literary evidence of the 'Odyssey,' to which he devotes a few lines at p. 227 of 'Tiryns,' is grotesquely superficial. It could not have been offered or accepted by any one who had even a rudimentary idea of what is meant by an adequate examination of literary evidence."

On the other point, the material employed in the construction of the house at Tiryns, I claim a right to pronounce a valid opinion because I have qualified myself by rigorous examination of many ancient structures in Greece and in Italy to do so. And I unhesitatingly say that the manner of construction and the materials employed are such as were never employed in classical structures, prior to the fourth century B. C. at all events, and have not been found in any building the date of which is determinable by historical evidence prior to the Roman conquest. The employment of material derived from the ruins of the Tiryns of the early epoch in the later building, which is evident, proves only, what nobody denies, that there was an ancient city there, and possibly of the Homeric date; but the constant use of the stone-saw proves that this material cannot have been earlier than the seventh or, at most, eighth century B. C., as we know approximately the date of the introduction of the stone-saw. But there are, as I have repeatedly pointed out to visitors with me to the ruins, bricks of good manufacture, well burnt and laid in mortar, in the walls which Dr. Dörpfeld has put as the walls of the palace. Now, burnt brick and mortar are not found in any ancient house in my experience, and the distinct statement of Philios, the most experienced excavator of Greek ruins living, is to the same effect. "The presence of mortar in any building," he says, "is conclusive against its belonging to the classical epoch."

I do not care to reconcile the contradictions which have grown out of the question, and for none of which I am responsible; nor do I concern myself about the omission to note this fact on the part of the excavators. Its actuality I have proved by breaking off, in the presence of members of the Archæological Society of Athens, a fragment of the wall indicated in Dörpfeld's plan as that of the ancient palace, and I am ready to repeat the proof. On this point I do not make any discussion. If, therefore, the plan of the building is not, as Prof. Jebb says, Homeric, and the material used includes elements unknown to remote antiquity, there is but one conclusion possible, viz., that the attribution to the Homeric epoch of the house at Tiryns has no scientific value, and that its reference to the classical era is even disputable; and I hold that there is no evidence whatever to justify the assignment of it to any period earlier than the admitted Byzantine buildings on the site, of the Byzantine origin of which there can be no doubt, for they contain a chapel and graves of well-known type. Except for the employment of the massive ancient material in the construction of what appears to be the chief house of the settlement, there is nothing to distinguish one part of the architecture from the other, and it evidently all belongs to the same period, viz., the latter part of the Byzantine rule, as is indicated by the fragments of Byzantine pottery with which the site abounded, and of which the most characteristic are preserved in the Greek archives.

The general conclusion, from which there is no escape, and which is of the highest impor-

tance in future study, is that the archæological conclusions of Dr. Schliemann cannot be accepted as scientific deductions, and that, while he has added immensely to the material from which science may draw useful results, his own method of investigation is utterly fallacious, and has never led to any conclusive scientific results. We must respect his memory for his enthusiasm and his liberality in his pursuit of Homeric traditions, but we may not permit this to mislead us in the study of archæology, remaining *amicus Platonis sed major amicus veritatis.* W. J. STILLMAN.

Correspondence.

WANTED—AN HONEST-MONEY ASSOCIATION.

TO THE EDITOR OF THE NATION:

SIR: In your issue of January 22 you say: "We believe that there is a sufficient body of public opinion in the country to beat the Free-Coinage Bill and eventually to put an end to the present dangerous Silver Law (of which nobody is really in favor except as a compromise), if that public opinion is ever organized and properly directed."

Probably all but confirmed "silverites" or pessimists on principle will agree with this, yet it must be admitted that intelligent public opinion in favor of honest money based on a gold standard has never made itself heard or felt to any adequate extent, and that ever since the law of 1878 first stamped light-weight dollars with the hypocritical "In God we Trust," the demands of the silver-producers and of the advocates of the rather indefinite "debtor class" have grown more persistent, one may even say impudent, with every concession made to them. Even now, with the dangers of a sudden drop to the silver standard staring us in the face, many of the anti-free coinage resolutions recently passed have a half-hearted and doubting sound, as if the present law were right enough and free coinage the only evil to be feared; while only those who have had some experience in securing investments on a gold basis can realize how blind the mass of the people are to the fact that there is anything unstable in the widely differing values of our double standard.

The reason for this extraordinary lethargy of public opinion can scarcely fail to be that it has never been either organized or directed in the least. That American citizens should hold sound views on the currency, and require their representatives to vote accordingly, is primarily their own business—that is, nobody's business—and unless a certain number of men will band together and make it *their* business to propagate such views, and show Congress that the people think honest money for us all more desirable than large profits for silver-miners, or even a partial repudiation of the liabilities of the "debtor class," the present movement towards free coinage will not easily be checked.

We have often seen how public affairs may be affected, sometimes practically directed, by the action of private citizens working together to arouse public opinion. The Anti-Slavery Society, the Reform Club with its committees, the Civil-Service Reform Associations, the Indian-Rights Association, and many others have made and are making their mark upon our institutions; and just such work as theirs is needed in regard to the currency. Meetings like that at Boston are invaluable, but there is need of continuous agitation through the newspapers, by short pamphlets showing what a change in the currency practically means, by appeals to investors of moderate means and to workingmen, and in various ways familiar to those who have worked in other lines of reform. The *Nation* and other papers are active in enlightening the public mind on this subject just now, but their work would be made much more effective if aided by the systematic and continuous activity of an organization.

One may well hesitate to urge any addition to the present number of reform associations, and perhaps some existing organization can do the work. The Constitution of the Reform Club refers to "sound currency" as one of its principles, and a committee of that active body, with the experience and knowledge of methods gained by the Tariff-Reform Committee, might supply that vital force which the party of honest money seems to lack. Possibly the leading spirits of that society may already have decided to act, but whether it be done by them or others, there ought to be some organization of the sound-currency forces to withstand the reckless assaults of the champions of fiat money. CHARLES C. BINNEY.

PHILADELPHIA, January 24, 1891.

FREE COINAGE OF SILVER.

TO THE EDITOR OF THE NATION:

SIR: That the recent action of the Senate of the United States in favor of the free coinage of silver has given alarm throughout the country to men who have had a large experience in business will hardly be doubted. Is that alarm reasonable?

A brief examination of the successive coinage laws of the United States and of the last report of the Director of the Mint will satisfy any of your readers that the following statements are true, and substantially accurate. If they are true, there should be little wonder at the shock which the recent action of the Senate has given to men of business.

By the Act of 1792, establishing a mint and regulating the coins of the United States, free coinage of both gold and silver was provided for, and the ratio of fifteen to one was fixed, that being very nearly the market ratio of gold and silver at that time. After many fluctuations of the market values of the two metals, during more than forty years, gold was at a premium, and the coinage difficulties of the United States had become so serious that in 1834 a new ratio of sixteen to one between gold and silver was fixed by law, that being very nearly the market ratio at that time. To bring the two metals into use again as coin, the amount of pure gold in the dollar was reduced, while the amount of pure silver was left as before. Our par of exchange with London was thus altered from 4.44 to 4 8665, and our dollar was no longer worth as much as before in the world's market.

Before the end of another twenty years the coinage troubles of the United States were again serious, owing to the great production of California gold. Silver was at a premium, and in 1853 our only fractional currency was being rapidly melted up. To save ourselves we bought silver, and from that time coined debased fractional money in limited amounts, having, however, the good sense to limit its legal-tender quality to small payments. The legal ratio of gold and silver was not changed, and the coinage of standard silver dollars remained free, but the price of silver was so high that for the next twenty years less than $250,000 of standard silver dollars were coined yearly, on the average.

The law of 1873, by which the free coinage of silver was formally abandoned, was not opposed by the people of the United States, silver being then at a premium in gold, as it had been for more than twenty years, and both being at a premium in legal-tender paper. The double standard had proved in practice to be a delusion.

Since 1873 the fall in the price of silver has been so great—the production from American and other silver mines having rapidly increased in spite of the fall in price—that in 1889 a legal ratio of twenty-two to one would have been needed to keep both metals in circulation with free coinage. If we should now give free coinage to silver as well as gold on the old ratio of sixteen to one, it is idle to hope that both could stay in use as money. We should be obliged to again lessen the amount of gold in our dollar, as we did in 1834, leaving it far below that with which we started less than a hundred years ago.

What the business men of the country fear, if the Senate bill now becomes law, is first a great shock to credit, and then, in one way or another, a currency debased and uncertain, with the evils that have always followed such a currency in this and in every other country. A great London merchant once said, impatiently, to a young friend: "I have tried hard to teach you what credit is. I believe it is hopeless to try. Credit is not money. It is the result of a long course of honorable dealing."

Let us pray that the United States will not now permit a delusive cry for more money to lead it to the destruction of its high credit.

H. C.

BOSTON, January 26, 1891.

"SHERMAN'S SHAM."

TO THE EDITOR OF THE NATION:

SIR: The attitude of Senator Sherman on the silver question calls forth hearty praise from the *Nation.* In this, I take it, you express only in part the sentiments of many of your readers. There must be in the minds of many a feeling of deep regret that the Senator has put it out of his power to do the country the service which it has a right to demand from him. His attitude towards the epidemic insanity of protectionism makes his attitude towards any other form of epidemic insanity a matter of comparative indifference. When he compelled us to call him a protectionist, he made it impossible to regard any of his opinions as those of an economist.

Again, thousands of the editors and politicians who have been preaching protection since the nomination of Harrison, would have greatly preferred to speak their real convictions. If the Chicago Convention had decided in favor of free trade, they would have been ardent free-traders by this time. Can these gentlemen be made to believe that John Sherman is any more sincere in advocating protection than they are? If so, they are prepared to believe that he is sincere in denouncing silver inflation.

"The great party to which I belong," says Senator Sherman. It is the curse of this country that it is governed by men who belong to parties. No great man ever belonged to a party. Parties belong to great men, who use them as instruments for the accomplishment of great ends. The man who belongs to a party ceases to belong to the nation and humanity, to truth and freedom and justice.

A. F. H.

GRANVILLE, O., January 26, 1891.

AN "INDIAN" OUTRAGE.

TO THE EDITOR OF THE NATION:

SIR: No right-thinking man who has lived

any length of time among the Indians of the Northwest can fail to be thankful for the manly plea in their behalf made by Father Craft, the heroic priest at Pine Ridge Agency. There are bad Indians, but there has been a considerable class among them who have been striving to be sober, upright men. Every instinct of right and justice demanded that these should be protected in their unequal struggle with the whites, as well for the sake of the Indians themselves as to save border settlers from the terrible vengeance sure to overtake them when a long series of heartless dealings on the part of the Government or of the settlers reawakens the inherited instincts of hundreds of years. I make no arraignment of white settlers as a class. But on the border there are always hot-heads who will embroil a whole community by their foolish and wicked acts. As at present there is a surfeit of accounts of Indian outrages, perhaps an account of an outrage of another sort may open the eyes of people who, while justly sympathizing with frontier ranchers, have no sympathy for the Indians.

On the Colville Reservation, an immense tract of land between the British line and Columbia and Okanogan Rivers, there are between eight hundred and a thousand Indians. Chief Moses, who has about two hundred Indians, is personally well disposed towards the whites, but his tribe belongs to the heathen Indians who are impatient of control. There are three hundred Indians on the Okanogan, ruled by chiefs Simitkin and Antone, Antone having been chosen by his tribe when their former chief Tenascott left to live on the Colville or eastern side of the reservation. Joseph, the remaining chief, is a fiery warrior who is never suffered to go abroad without an escort of Indian police.

Antone's Indians and Simitkin's are Christians, and, as I know from my own observation, have so far been law-abiding, peaceable people, living on their farms and coming together three or four times a year for a few days to attend Mass and other religious exercises. At such times there has been no drunkenness, profanity, nor gambling. The chiefs would every day harangue their tribes on the evils to which they were exposed (notably white men's whiskey) and exhort them to be good upright men and women lest their race be utterly destroyed. There would be service in the church three or four times a day, and finally, after a grand hand-shaking, the Indians separated to their homes. There are a few renegades, disliked by the Indians themselves, who go to horse-races, gamble, and do what they can to justify the adage concerning a good Indian.

Last fall a man named Cole disappeared while crossing the reservation. An Indian, undoubtedly his murderer, was arrested, and, on forcibly resisting the sheriff, shot. It was supposed there was another culprit, but he was never found, and now probably never will be. About a week ago at the Okanogan Mission a young Indian came out of the church with the priest. A number of the tribe were there, and one of them, stepping up, asked him if he knew anything about the murder to tell them. The priest then said: "Tell exactly what happened." Here follows his story:

He was riding the range after stock, and fell in with two other Indians. The others had whiskey, and they all drank. The three rode on together until they overtook Cole. They stopped and talked awhile, until finally a quarrel arose, and Cole got down from his wagon and started for them with an axe. The boy had just ridden around to have the wagon between himself and the others when he heard a shot. Without looking to see the result, he put spurs to his horse, and never stopped until he reached Chief Simitkin's, fifteen miles away. He added that he could identify the murderer, still at large, and could tell who sold the Indians the whiskey.

Hereupon he was advised to surrender to the authorities. Word was sent to Conconnully, the county seat, and an officer went to the reservation and promised that no harm should befall the boy, whom he took back to Conconnully. The justice who heard the case refusing to give bail, a writ of habeas corpus was issued by the Court Commissioner. The only apology for evidence offered was that, after the murder, two drunken Indians were seen in the vicinity, and the boy could not be identified as one of them. The Commissioner fixed bail at $1,000, and the prisoner was remanded to the county jail.

At two o'clock on the morning of January 8, ten masked men forced an entrance into the jailer's bed-room, and, covering him with their revolvers, compelled him to go to the jail and open the cage in which the prisoner was confined. They then took this poor boy—a mere child, fourteen years old—threw a rope about his neck, and led him, scantily clothed and barefooted, through the snow, in the piercing winter weather, outside the town. The rope was flung over a bough, and the miscreants pulled until they had raised him off the ground. They fastened the rope and left him dead.

The most plausible reason for this infamous night's work is that certain persons feared exposure for whiskey-selling to Indians. All chance of discovering the second murderer of Cole is destroyed. The Indians are furious; and who can wonder? While the officer who brought the boy in from the reservation most unwisely exceeded his powers in promising him freedom again, still it must seem to the Indians that all of us whites deliberately participated in a lie that we might get one more of them in our power and kill him. They believe, and with too much reason, that there can be no law nor justice for one of themselves, but that the whites are leagued together to kill them whenever they can do so without discovery.

This is not the first time that settlers have owed their scalps to the priests. There has been no outbreak, and the chances are overwhelmingly against one; but the ranchers in distant parts of the country are safe only because of the influence of the Jesuit Father de Rongé, and the Christian chiefs.

LOOP LOOP, OKANOGAN CO., WASH., January 15, 1891.

WOMEN AT JOHNS HOPKINS.

TO THE EDITOR OF THE NATION:

SIR: The writer of the letter entitled "Women at the Johns Hopkins," published in last week's *Nation*, makes certain statements that are likely to mislead the friends of women's education who are unacquainted with the true position of affairs in Baltimore. I beg, therefore, to be permitted to draw attention to the following points. Your correspondent, when he finds "retrogression as well as progression" in the policy of the Hopkins Trustees, ignores the all-important fact that they accepted the precise terms proposed to them by the committees of women that had organized themselves from Boston to New Orleans and from Baltimore to San Francisco, for the purpose of preferring this request to the University. The words used by the Committees—"that women whose previous training has been equivalent to the preliminary medical course shall be admitted to the school, when it shall open, upon the same terms which may be prescribed for men"—were expressly designed to restrict their request to the Medical School proper. Whatever fault is to be found should be found rather with those who asked than with those who gave all that was asked. The Trustees' cordial words of acceptance are especially significant, in that there is as yet no legal provision made for women physicians in the asylums and penitentiaries of Maryland:

"This Board is satisfied that in hospital practice among women, in penal institutions in which women are prisoners, in charitable institutions in which women are cared for, and in private life when women are to be attended, there is a need and place for learned and capable women physicians, and that it is the business and duty of the Board, when it is supplied with the necessary means for opening its proposed medical school, to make provision for the training and full qualification of such women for the abundant work which awaits them in these wide fields of usefulness."

The "Preliminary Medical Course," in regard to which your correspondent finds it necessary to have recourse to conjecture, was first organized by the University in 1882, and is given under that title in the index of all the succeeding university catalogues; it presupposes the ordinary college matriculation requirements in mathematics, Latin, history, science, and in either Greek or French and German; and its three years of collegiate work include advanced courses in French and German, five hours weekly of class work and five hours weekly of laboratory work for two years in both chemistry and biology, and five hours weekly of class work and three hours weekly of laboratory work for one year in physics. This course is the third (the chemical-biological group) of the seven undergraduate courses leading to the degree of B. A., and to open it to women would be to throw open the University without restriction, and to accept undergraduate coeducation in its fullest sense. The result would be not, as your correspondent seems to think, "that women who are to be trained jointly with men in hospital wards, in clinics, and in medical lecture-rooms" would "two years earlier receive instruction in common with them in physical, chemical, and biological laboratories"; but that such women would meet in the class-rooms, not only their fellow "preliminary medical" students, but all the other undergraduates of the University; for one year of some science is required of all candidates for a degree, and the other years of science as well as the French and German courses are elected by other students at will.

To what extent in this or that institution a substitute may at present be found for the undergraduate instruction of the Johns Hopkins University, is difficult to discuss; but there are excellent schools of science already open to women, and it lies in the very nature of undergraduate instruction that its methods and its apparatus can be duplicated.

M. CAREY THOMAS.

BRYN MAWR, January 26, 1891.

CIVIL-SERVICE REFORM IN STATE LIBRARIES.

TO THE EDITOR OF THE NATION:

SIR: The attention of the friends of civil service reform should be directed to those States (particularly in the West) where the office of State librarian is still regarded as a part of the spoils belonging to the victors. The recent changes of State administrations make probable several decapitations of old and trained State librarians, to make place for inexpe-

rienced persons, probably party-workers or favorites of the new administrations; unless the new Governors should follow the bright example of Gov. Boies of Iowa, last year, who recognized that it was good *politics*, as well as good *principle*, to regard the office of State Librarian as a non-partisan one, and retained the appointee of a former Republican Administration.

The proposition is now too well recognized to need argument, that the librarian should be a person *trained* to the work, or, in other words, that one cannot, at a few days' or weeks' notice, become competent to conduct the affairs of a large and important library, such as most of the State libraries now are, even in the newer States. The Association of State Librarians, at their meeting in St. Louis, in May, 1889, as a part of the work of reform in State library management and legislation which it has undertaken, resolved "that tenure of office [of State librarians] should be made dependent on efficiency solely, and not on changes of administration, political or otherwise." The influence of the various civil-service reform organizations, national and State, could be used to great advantage in this direction, to the benefit not only of their own cause, but to that of libraries as well.

WASHINGTON, D. C., January 26, 1891.

THE DISCOVERY OF ARISTOTLE'S CONSTITUTION OF ATHENS.

TO THE EDITOR OF THE NATION:

SIR: A discovery of no small importance has just been made among a mass of papyrus-rolls recently acquired by the British Museum. This is nothing less than the almost complete text of Aristotle's 'Description of the Constitution of Athens.' I say the almost complete text because the opening is missing, and the concluding portion is badly mutilated. Apparently nothing could so well be spared as these missing portions, and certainly no part of Aristotle's collection of 158 constitutions could be more welcome than what has just been found —its first and most important chapter. Even those few who have thought that antiquity was wrong in attributing this work to Aristotle, will recognize the epoch-making importance of such an addition to our means of knowing Athenian constitutional history at first hand. Here we have an authority freely used by Plutarch, by Pollux, and by Harpocration as well as by many others, whose works have hitherto been our only possible source of information about vital questions concerning ancient Greek institutions. Facsimile reproductions of this newly found text will soon be published, and meanwhile it has been printed by order of the trustees of the British Museum, and will shortly appear with accompanying introduction and notes by Mr. Kenyon of the Department of Manuscripts.

As for evidences of its genuineness, they appear to be abundantly forthcoming. The possibility of entertaining a supposition that we have here a repetition of the Simonides-Shapira episode, of recent and painful memory, is entirely removed by the fact that, when the rolls in question were acquired, neither of the parties to the transaction dreamed of its importance to the learned world, or had the least idea that a treatise by Aristotle was involved. Even if this were not known to be the fact, a careful examination of the newly found text yields apparently such internal evidence as to be absolutely "conclusive." A competent and careful examination of the new text reveals the fact that of the fifty-eight citations from Aristotle's description of the Constitution of Athens definitely known in various ancient writers, fifty-five "occur with appropriate context in the text of the papyrus now in the British Museum." The absence of two out of the remaining three results from their occurrence at the beginning and the end respectively of the treatise, which fact precludes the possibility of finding them in this version, where the former is lacking and the latter is mutilated. One passage only of the fifty-eight in question remains still undiscovered in the papyrus-rolls just deciphered, or rather the corresponding passage there found presents serious discrepancies when confronted with it. Besides the fifty-eight fragments above referred to, where Aristotle's 'Athenian Constitution' is directly quoted, there are thirty-three other quotations which have been more or less conjecturally supposed to belong to that work. Of these all but ten occur on the newly found papyrus, and of the missing ten some probably have been wrongly connected with it, and others possibly are from its missing beginning or its mutilated end. Confirmation of the genuineness of the version written upon these papyrus rolls, and also further proof of the authenticity of the two papyrus fragments at Berlin, is found in the appearance of the contents of both these fragments upon the newly deciphered text.

Now that this latest philological windfall has proved for us its own authenticity, and saved the long labor of its defence, it would seem that the least to be required would be some strenuous effort in discovering its date. But this labor is also most considerately spared us. The approximate date of the new text can be known to any one who is competent to read the accounts of a private estate in Egypt, dated month by month in the eleventh year of Vespasian, which occupy what is technically called the *recto* of the British Museum papyrus. The text of Aristotle, written on the *verso* in four distinct hands, agrees with these accounts in certain minutely characteristic points, such as remarkable forms of letters and abbreviations. The date, then, is later than the eleventh year of Vespasian, and as early as accounts belonging to that year can supposably have lost their importance, say 95-100 A. D.

Apparently little will be added to our present knowledge of the picturesque side of Greek history by this new discovery or recovery; nothing is gained towards the enhancement of our realization of the intellectual primacy of Greece and Athens. But still certain blanks are filled in a way which will rejoice not the minute student of Greek constitutional history only, but every one who appreciates the Odyssean subtlety of a certain unconscientious type of Hellenic character well exemplified by the unscrupulous Athenian patriot Themistocles. Needed light is thrown upon the hitherto obscure nature of Draco's legislation, and the position of Solon and Pisistratus with regard to the development of Athenian democracy becomes more clear. Detailed information on all these points will be gathered from the forthcoming publication. Meanwhile readers of the *Nation* will doubtless be interested in the account of a hitherto unknown passage in the life of Themistocles, given by an eminent authority who takes it from the newly discovered text of Aristotle's 'Description of the Constitution of Athens':

"It appears that the final attack on the ancient council [of the Areopagus] was led by Ephialtes, and that it was delivered in the year 462 B. C. In this enterprise Ephialtes had a strange ally from among the members of the Areopagus itself, in no less a person than Themistocles. This somewhat tortuous politician was at that time under apprehension of a charge of Medism, which was being investigated by the Areopagus, and his share in the attack which was now being made upon that body consisted principally in hastening the course of events. Having first warned Ephialtes that the Areopagus was about to arrest him, Themistocles proceeded to the Areopagus and there denounced Ephialtes as being engaged in a conspiracy against the State, and offered to conduct a party to the house where the conspirators were assembled. On arriving at the house of Ephialtes, he managed that he should be seen talking with the members of the council who accompanied him. Ephialtes, thinking, no doubt, that the warning of Themistocles was being fulfilled, escaped and took refuge at the altar; but, realizing that his only chance of safety lay in taking the bull by the horns, he hurried to the Council of Five Hundred and made a violent attack on the Areopagus, presumably proposing to strip it at once of its peculiar powers. In this he was seconded by the versatile Themistocles, who no doubt was able to furnish some plausible explanation of his conduct. The matter was carried from the Council to the Ecclesia, and the attack was there completely successful. The Areopagus was deprived of all the rights which made it the general guardian of the State, and its functions were distributed between the Five Hundred, the Ecclesia, and the law courts."

LOUIS DYER.

LONDON, January 19, 1891.

Notes.

THE Historical Society of Pennsylvania is about to publish the Writings of John Dickinson, beginning with a Life of him which has been written by Dr. Charles J. Stillé. That the public at large may not be deprived of this work, a separate edition of the Life will be offered to the trade. It will be ready in a few weeks.

'Canada and the Canadian Question,' by Mr. Goldwin Smith; 'Literary Essays,' by Bishop Westcott of Durham; 'The Light that Failed,' by Rudyard Kipling; and 'Social Diseases and Worse Remedies,' Prof. Huxley's criticisms in the London *Times* on Gen. Booth's scheme, are in the press of Macmillan & Co.

Other letters to the *Times*, namely, by W. Laird Clowes, are to make a volume called 'Black America: A Study of the ex-Slave and his Late Master,' which Cassell & Co. will publish.

The late Prof. Thorold Rogers left behind him the materials for the concluding volumes of his 'History of Prices and Agriculture in England.' A single volume will be made of them by his son, Mr. Arthur G. L. Rogers, and issued in one volume by the Clarendon Press.

Charles Scribner's Sons announce 'Essays in Little,' by Andrew Lang; 'Original Charades,' set forth in verse, by L. B. R. Briggs; 'English Composition,' eight lectures delivered at the Lowell Institute, Boston, by Prof. Barrett Wendell; and the sixth edition of the late Dr. Woolsey's 'Introduction to the Study of International Law,' brought up to date by his son, Theodore S. Woolsey.

A 'Life of Charles Brockden Brown, with a View of Post-Revolutionary Literature,' by Edward Irenæus Stevenson, is to be published by the Welsh, Fracker Co.

Ward, Lock & Co. have undertaken an *édition de luxe* of the 'Lyra Elegantiarum,' edited by Mr. Frederick Locker-Lampson and Mr. Coulson Kernahan. It will be limited to 250 copies, each signed by Mr. Locker-Lampson, whose portrait, by Sir John Millais, will form an etched frontispiece.

Paul Bourget's 'Un Cœur de Femme,' done into English by Camden Curwen, under the title, 'Was It Love?' will shortly be brought out by Worthington Co.

Thomas Whittaker promises a series of "Studies in Christian Biography," beginning with 'St. Augustine and St. Chrysostom,' by Dr. Philip Schaff.

Two volumes of verse, 'Bohemia and Other Poems,' by Isabella T. Aitken, and 'Dramatic Sketches and Poems,' by L. J. Block, are soon to be issued by J. B. Lippincott Co.

The Salem (Mass.) Press Publishing and Printing Company have ready for publication a genealogy and history of the Treat Family in America. Up to 1800 the record is considered nearly perfect. Subscriptions are invited by the compiler, John Harvey Treat, Lawrence, Mass.

The twenty-fifth volume of the 'Dictionary of National Biography' (Macmillan) is the third since the letter H was taken up, and closes with Henry I. This monarch is delineated in fifteen pages, Henrietta Maria, wife of Charles I., in eight; and among British subjects, Warren Hastings receives most attention, in eleven pages. Other long sketches are those of William Hazlitt, by the senior editor, Leslie Stephen, noticeably minute; Haydon, the painter; Lord Hawke; and Sir John Hawkins, whose aliases in Spanish (Aguinas, Achines, Acle) and in Portuguese-Latin (de Canes) recall those of another English adventurer here commemorated at corresponding length, Sir John Hawkwood (Haucud, Haucwod, Haukcwod, Haukutd, in his own free spelling; Haccoude in Froissart; Acuto, Aguto, Aucud, etc., in Italian). Among the Hastings tribe occurs Selina, Countess of Huntingdon (1707-1791), the founder of revival chapels forming a "connexion" which is still a living institution, as one may see by consulting the rubric "Countess of Huntingdon's Connexion" in the latest *Hazell's Annual*. John Harvard is duly celebrated, but with hardly enough recognition of Mr. Henry F. Waters's part in revealing his pedigree; and John Haynes, third Governor of the Bay colony and first Governor of Connecticut, is another of the founders of New England who finds a place in this instalment of a work possessing the highest interest for all English-speaking peoples.

In 'The Worldly Wisdom of Lord Chesterfield' (Clarendon Press; New York: Macmillan), Dr. George Birkbeck Hill has gathered selections from the famous letters and added some of the 'Characters' with sufficient skill to make the volume readable and serviceable to the noble author's literary reputation, which has paled in this century. An introductory essay prepares the reader to find good in the courtier of a world essentially mean, and the selection discreetly ignores what most offends the moral sense of the present time in his Lordship's paternal advice. The passages characterizing woman in general are retained, but otherwise there is comparatively little which would not be accepted to-day by those who think etiquette and formal obligingness any important part of conduct; and it is to be acknowledged that the turn of the sentences is often very clever and the substance full of good sense. Generally, Lord Chesterfield is an author safely to be avoided, but here acquaintance with him is a very tolerable thing.

A new edition of Bacon's 'Essays' (Clarendon Press; New York: Macmillan), by Samuel Harvey Reynolds, is the most complete in its apparatus of notes and illustrative passages yet made. The editor's attitude towards his author is very unfavorable; he misses no opportunity of justifying the epithet "meanest of mankind" applied to Bacon, but he admits the eloquence of the essayist. The most valuable portion of the work, which is one of great learning and industry, consists of the illustrations of Bacon's sources in ancient or contemporary authors; in the verification of his misquotations, and the right ascription of the passages Bacon had in his memory when he wrote; also, in showing his habit of using over in the Essays thoughts and figures which he had employed in other writings. The notes upon the English are rather more full than was necessary when the Bible and Shakspere are still read, and the frequent annoyance of the editor at Bacon's grammar becomes an annoyance to the reader. The work altogether is a very complete one, and indispensable to the student of the Essays if he desires to go deeper than the obvious meaning of their contents in his study.

The sixth volume of Prof. Henry Morley's 'English Writers' (Cassell & Co.) comprises the period from Chaucer to Caxton, and is occupied by the usual encyclopædic account of the Romances, Chronicles, Dictionaries, Translations, Ballads, Caxton's publications, etc., together with a chapter on block-books and early printers of Europe, and brief notices of a score of minor poets, besides more extended articles on Lydgate, Occleve, Pecock, Sir John Fortescue, etc. The minuteness of this survey is the most important of its good qualities, bringing as it does into an accessible and handy volume an immense amount of erudition, scattered elsewhere through many books. This volume completes the first great division of the author's works, and he offers title-pages to such as may wish to bind the six volumes as a 'History of English Literature from the Earliest Times to the Invention of Printing.' He hopes to conclude the work in fourteen more volumes.

The new edition of Palgrave's 'Golden Treasury' (Macmillan), which has so long held its place without a rival as a repertory of English songs, lyrics, and sonnets, is welcome because of the larger type and page, although the volume becomes less handy thereby and ceases to be a book for the pocket. Most readers, too, will welcome the added poems, especially those of Sidney, Vaughan, Norris, Blake, and the anonymous songs from the Elizabethan time. The space given to Campion seems large, however, and several of these new candidates for the immortality of an anthology will not receive unanimous favor: "Agnes," by H. F. Lyte, for example, is a poem which has no such intrinsic merit or accepted fame as to entitle it to admission, and a few others are in the same category. The use of Blake's "To the Muses" as the opening poem of the Fourth Book, with its depreciation of modern verse, seems to us a grave fault of judgment. Several poems of the old collection are dropped, among which we notice with surprise Shelley's "Life of Life" and "Rarely, rarely comest thou." The collection loses by its omissions and gains by its additions. The total number of selections is increased by thirty-nine.

Shelley's Poetical Works form the fourth volume of that admirable series of English poets of the present century begun by Macmillan & Co. with Wordsworth, Tennyson, and Matthew Arnold. The editing has been intrusted to Prof. Dowden, who furnishes a compact introductory sketch of Shelley's life. Since in this he feels free to repeat the facts as to Harriet Westbrook's ultimate degradation, we cannot well excuse his omitting any hint of her nobility of mind and real intellectual force, as revealed in her correspondence with Catherine Nugent during her early married life—letters published in these columns last year by Mr. Alfred Webb. For the rest, Prof. Dowden avails himself of the labors of his predecessors, and produces a very scrupulous text, with notes of various readings, for some of which he acknowledges indebtedness to the Harvard College MS. as edited by Mr. Woodberry. There is also a list of Shelley's principal works, and here we should have been glad to find Dr. Garnett's "Select Letters of P. B. Shelley" (1883), despite its not coming strictly under the heading. The volume closes with an index of first lines.

Students of early American literature will find in Mr. Greenough White's 'Sketch of the Philosophy of American Literature' (Ginn & Co.) a faithful and well-informed study of the course of its history in general outline. The only criticism to be made upon the pamphlet is that it attempts to make a great subject of what is really a small one, and that the treatment of the last period of our literature seems disproportionately restricted in comparison with the earlier portions of the essay.

Ginn & Co. have issued vol. ii. of 'Open Sesame!'—a collection of poetry and prose for school-days, edited by Blanche Wilder Bellamy and Maud Wilder Goodwin, with special reference to boys and girls from ten to fourteen years of age. Half of it is given up to the rubric "Loyalty and Heroism"; other extracts are grouped as "Sentiment and Story," "Song and Laughter," "Nature," and "Holidays and Holy Days." Translations have been availed of, and the range thus widened considerably. The standard has been kept high, and no child will be the worse for memorizing the most of the pieces. The same may be said of 'Harper's Sixth Reader,' edited by James Baldwin from British authors exclusively. The Messrs. Harper have also published, in their "English Classics for School Reading," Lamb's 'Tales from Shakspere's Comedies,' edited and annotated by Dr. Rolfe, who appends a good many of the passages in verse summarized by Charles and Mary Lamb—an excellent idea.

In his 'Outlines of Physiological Psychology' (Charles Scribner's Sons), Prof. George T. Ladd has revised, modified, and abridged his larger work by the same name, and has better adapted it to classes of less pretentious ambition. It still confines the subject-matter to physiological and experimental psychology, with a mere spicing of introspective questions, and so does not enter into competition with the ordinary text-book. On the whole, we regard it as even better than the larger work, as it is more judicious and mature, having the advantages of longer reflection upon the subject and larger experience in teaching it. For its purpose there is not a better text-book in the language.

Several volumes on our table invite to warmer climes. 'Appletons' Handbook of Winter Resorts' makes its annual reappearance with revision. The painstaking volume, 'San Antonio de Bexar,' compiled by William Corner and called a guide and a history (San Antonio, Texas: Bainbridge & Corner), has a frank chapter on the town as a health resort, which is placed in the front rank for affections of the throat and lungs. The illustrations are photographic and very attractive. Mr. Charles Ledyard Norton's 'Handbook of Florida' (Longmans) is an excellent performance, full, well-arranged, and in its literary execution far above the ordinary guide-book. It must supersede everything yet attempted in this line. The historical portions have been carefully elaborated, and the volume is well supplied with maps. Mr. Norton gave us last year under the same title only the Atlantic Coast; the present issue is more than half as large again. Walbridge & Co. of this city send us 'The

New Jamaica,' by Edgar Mayhew Bacon and Eugene Murray Aaron. It is a useful guide-book, but it cannot be compared with Mr. Norton's. There is, of course, a chapter on the climate, and another on the Industrial Exhibition, which the "protected" United States takes little interest in. The cuts are rather crude.

Mrs. M. Carey's translation of Baron Hochschild's 'Désirée, Queen of Sweden and Norway' (Dodd, Mead & Co.), is sufficient if not very flexible or skilful; and the charm of the story is not lost. The late Eugene Schuyler made it the text of a long account of Bernadotte's Queen in these columns nearly two years ago. The publishers have produced a very pretty book.

We need not recur to the contents of Renan's 'Future of Science,' which comes to us in an anonymous translation from Roberts Bros., Boston. It is a needlessly large and ungainly book, in very coarse print.

Some of the opposition to the Copyright Bill comes from legislators who honestly believe that the absence of international copyright is the cause of the cheapness of books in America. The American Copyright League issued a pamphlet on 'Cheap Books and Good Books,' to show that good books, the classics of all literatures, were not as cheap in the United States as in Europe. A recent double-page advertisement in the *Bibliographie de la France* is evidence in support of this contention. It contains a list of the books already published in the "Nouvelle Bibliothèque Populaire" (Paris: Librairie Blériot; New York: F. W. Christern). This collection now extends to more than two hundred numbers; and the price of each volume is ten centimes—two cents! In the main, of course, this collection consists of the classics, Shakspere, Voltaire, Swift, Sterne, Molière, Virgil, Goldsmith, etc.; but more than sixty of the two hundred volumes contain the writings of contemporary authors, Coppée, Theuriet, George Eliot, Carmen Sylva, Tolstoi, etc. Eleven volumes are of American authorship, being translated from Franklin, Irving, Longfellow, Hawthorne, Poe, Dr. Holmes, Bret Harte, "Marc Twain," and Mr. John Habberton. One of the two volumes contributed by Mr. Clemens contains "La grenouille sauteuse" and "Le vol de l'éléphant blanc.'

As the labor legislation of Massachusetts has in recent years been considerable in amount, a compendium of these laws has been prepared by the State Bureau of Statistics of Labor, and is now published in pamphlet form. As it is supplied with a full index, it is a convenient manual for reference.

No. 21 of the 'Complete Index to *Littell's Living Age*' (1135 Pine St., Philadelphia: Edward Roth) comprises the whole of the division called "Social," and completes Volume I., which deals with the first hundred volumes of the *Living Age*.

The *Bookbuyer* for February, in pursuance of its practice of giving every month a portrait and biographical sketch of some littérateur of the day, thus makes known Mr. George Edward Woodberry to the reading public which he has addressed with so many titles to be listened to and remembered. The portrait of the author of the 'Life of Poe,' of 'The North Shore Watch, and Other Poems,' and of 'Studies in Letters and Life'—to mention only his best-known work in history, poetry, and criticism—is not an inspired likeness, but will serve for recognition of the merely external features.

In the January *Bulletin* of the Boston Public Library (now a subscription periodical, by the way) will be found a handy list of books on costume. Mr. Paul Leicester Ford's bibliography of the official publications of the Continental Congress is continued.

Mr. Alfred C. Potter's Bibliography of Beaumont and Fletcher has been reprinted by itself from the Bulletin of Harvard University.

We have received the *Mentor*, a new monthly magazine published in Boston by the Alumni Association of the Perkins Institution for the Blind, and the *Doll's Dressmaker*, a new illustrated magazine for girls published in this city at 35 East Seventy-seventh Street. Parents who object to dolls altogether will take warning; others may take satisfaction in the practical instruction in needle-work involved in the scheme of this magazine, to say nothing of what will be taught in other useful branches.

The plain-spoken *Rio News* has in its issue for December 29, 1890, some timely censure of the order of the Minister of Finance "for the collecting and burning the official records relating to slavery and emancipation." "It is," says the *News*, "merely an expression of overwrought sentimentalism, like that which led the Paris mobs to destroy priceless treasures because they had been associated with the men and measures of an overthrown régime." Was it not Catharine of Russia who ordered the word slavery stricken out of the dictionary?

"J. C. N." writes us from Cincinnati: "The apparent connection between 'war and the weather' which Mr. Edward Powers traces, was noticed centuries before ever cannon volleyed and thundered. Plutarch, in his 'Life of Marius,' says: 'It is observed, indeed, that extraordinary rains generally follow after great battles; whether it be that some deity chooses to wash and purify the earth with water from above, or whether the blood and corruption, by the moist and heavy vapors they emit, thicken the air, which is liable to be altered by the smallest cause' (Langhorne, vol. ii, 302). We cannot accept the old Greek's explanation, but does not this evidence of the antiquity of the storm coincidence invalidate the artillery theory for its origin?"

—The February *Century* contains a very speaking account, both in the illustrations and the text, of the Cracker population of the Georgia cotton-mills, and opens to public view a disheartening state of things for which no remedy seems sufficient. The grown-up portion of this peculiar people are in hopeless subjection to wretched habits and mean standards of life, and the children, in the absence of effective laws restricting child-labor, contract the same weaknesses and invite the same misery. The only motive of ambition we discover in this article is the race-wish to keep ahead of the negroes. The little improvement indicated, however, is altogether insignificant, and no amount of local color, picturesqueness, or the lazy content of these men and women with their degradation should be allowed to cloud perception of the disgrace this mill-life in Georgia affixes to civilization in this country. We turn from it to the intelligent and orderly description of the state of labor in Australia, where the workingman is said to be more prosperous materially than elsewhere in the world, with less hours and more pay and larger opportunities of recreation commonly used. The reason for this condition of affairs and the question of its maintenance are discussed with moderation, and the whole general subject of the future of Australia in industry, agriculture, pasture, fruit-raising, etc., and in political development is treated broadly and suggestively. The most noticeable influence of this country on Australia seems to be the determination of the public not to allow any race-question to begin, although the sugar-plantations and the capital invested there should be sacrificed as the price of the exclusion of the only labor that can be used on them. The extracts from the Talleyrand memoirs are entirely about Napoleon, and are of greater interest than the chapter last month. It appears that Talleyrand justified himself for interfering with his master's plans, or attempting to thwart them, by the defence that he was caring for the interest of France or of Europe when betraying his chief. The conversation between Napoleon and Goethe, and also that with Wieland, are given *verbatim*. An interesting paper on the artist Rousseau, with characteristic cuts, is contributed by Mr. Charles De Kay, and the Californian papers devoted to the gold discovery are noticeable for some contemporary caricatures as well as for their contents.

—A curious illustration of the difficulty of securing historic accuracy has lately come to light in regard to the date of Margaret Fuller Ossoli's death by drowning. The peculiar tragedy of the whole affair attracted wide attention, and might, one would have thought, have fixed the date correctly. Yet every professed book of reference which we have consulted—the 'Britannica' (8th edition), Appletons' and Johnson's Cyclopædias, Duyckinck's 'American Literature,' Appletons' 'Dictionary of Biography'—gives it as the 16th of July, 1850; except Mrs. S. J. Hale's 'Woman's Record,' which gives it as August 8! But the three American biographies of her agree in giving it as July 19; and this same date is given in the *Tribune* (*Whig*) *Almanac* for 1851, and is confirmed by all the newspapers of the time. Thus the Boston *Daily Traveller* of Monday, July 22, 1850, had, among its telegraphic news, "Ship *Elizabeth* . . . went ashore on Friday last"—this being July 19; and the Boston *Daily Advertiser* of July 24 had only got so far as to announce that the loss was "confirmed." It was Tuesday, July 23, when Charles Sumner and others went to Fire Island to look for the bodies. In the Fuller family Bible, Mrs. Fuller records the date of her daughter's death as July 19. The curious question arises, how this error originated. Apparently in the fact that the 'Encyclopædia Britannica,' in 1859, got the date wrong—the ninth edition omits it altogether—and all American books of reference found it easier to follow that than to look in the three carefully prepared biographies, or in the *Tribune Almanac*, or to consult the newspapers. The error in 'Appletons' Cyclopædia' is peculiarly noticeable, as both its editors were Mme. Ossoli's friends, or at least acquaintances, and both were connected with the New York *Tribune*, whose annual almanac had given the date correctly. It all illustrates the extreme tenacity and vitality of an error.

—The Incorporated Society of Authors held their annual meeting on the 15th of January, in the Whitehall Rooms of the Hotel Metropole, London. The one question of vital importance, to English and American authors alike, which came up for discussion was the new American Copyright Bill. But Sir Frederick Pollock, the Chairman, Mr. Walter Besant, and the few who spoke on the subject, were very cautious and non-committal. There seemed to be a general feeling that the less said until the bill had actually passed, the better. Then Sir Frederick Pollock thought it would be time to give serious consideration to that clause which provides that a book to be copyrighted must be printed from type set up

within the limits of the United States; but even then it would be wise for authors to wait until those who are most interested pronounce an opinion or take active steps. However, no matter what the fate or drawbacks of the act, he suggested that a vote of thanks be passed by the Society to the American authors who had supported the bill, and this motion was eventually proposed by Mr. Besant and, needless to say, unanimously passed. Mr. Besant delivered himself of the opinions published in last month's *Author*, the organ of the Society, which are briefly these: Pirates will not be smitten with confusion by the act, because of the large stock of stolen property they have on hand, and because copyrights are always expiring. They will not be able to pay for the best new British books, but for second and third-rate publications they will offer a five-pound note for the copyright, and this will be accepted by British authors, who, Mr. Besant seems to think, will take anything they can get. And as for the printing, it will not be done altogether in America—in the first place, because, with a successful book, the cost of composition is a trifle; and in the second, because there lives not "a caitiff Briton so vile as to allow, if he can prevent it, his work to appear in his own country in the vulgar and debased spelling adopted in the States." Spelling will be dearer to the British author than filthy lucre, for all that eagerness with which he clasps a five-pound note! It may be interesting to mention that the Society of Authors are thinking of founding an Authors' Club in London on the same lines as those of the well-known institution of the name in New York.

—Perhaps there are good reasons why an Englishman of letters should bless the narrow seas that separate him from France, and wish they were a whole Atlantic broad, but these reasons do not relate to his fame as a writer or to the understanding of the man or of his work. In these regards the Channel is now as wide as the Pacific. The *Revue Bleue*, the best informed and most judicious of the French weeklies, furnishes some good evidence of this in its number of January 3. It is speaking of the death of the late Dean of St. Paul's (which took place on the 9th of last December), and says of him, that Dean Church "occupied himself but little with theology; his recent book on St. Anselm was much more a literary study than a religious work. But his books and essays on Dante, on Spencer [*sic*], on Bacon are, in point of originality of ideas and of a natural elegance of style, works of the first rank, and they will be reckoned among the best productions of English literary criticism." The 'St. Anselm' is not precisely a recent work, since the main part of it appeared in the *British Critic* in 1843, but that is a matter of not much consequence. The great mistake of the *Revue* lies in its confusion of what were no more to Dean Church than literary recreations with what he considered his serious work. He was first and foremost and always a priest of the English Church. Neither Keble nor George Herbert delighted more than he in the life of the country parson. No one at Oxford was more active than he in the years that preceded Newman's secession, and there was perhaps no man who had in those days more of Newman's confidence and affection. Certainly his position in connection with the great leader of the Oxford movement was much more important than that held either by Frederick Oakeley or William George Ward; and after Newman's departure the part he played was more important still. With his friend, Sir Frederick Rogers (afterwards Lord Blachford), James Mozley, and Mountague Bernard, he founded the *Guardian*, which has been through the last fifty years probably the most weighty of the English Church newspapers. Church wrote much in its columns, contributing to them down almost to the last week of his life. When he became, most unwillingly, Dean of St. Paul's, there was a marked contrast to be seen between his attitude towards the work there and that of his literary predecessor. His full sympathy and help went to those of the Chapter who have revolutionized the cathedral and turned it from what was merely a showplace, with an admission fee of twopence to be paid at the door, into what the *Times* lately called "the home and centre of church life in London."

—While it seems plain to any one who considers Dean Church's life that he was—what he always looked upon himself as being—first a priest, and after that a man of letters, still it would be a mistake to look upon him merely as an ecclesiastic, or at all as a narrow ecclesiastic. His sympathies were as wide as his culture. No knowledge and no persons who possessed knowledge of any sort seemed to be indifferent to him. "Any one of note, whether it was a Benedictine from Portugal seeking information in the Bodleian, or a Syrian explorer like Mr. Hormuzd Rassam, or a famous botanist like Professor Asa Gray, or a rising naturalist such as Dr. Sclater then was, or an eager physicist like Frank Buckland, was sure of a welcome from him in the Oriel common-room." Fraser, Clough, Matthew Arnold, Henry Coleridge, were his companions at Oriel and his friends; and while he was perhaps more closely bound to men, like James Mozley and Charles Marriot, who shared his theological sympathies, he was often to be found with Stanley or Jowett or Lake, Balliol men of quite a different cast of mind from his own. Mark Pattison distinguishes him by perhaps the only tender or gentle judgment that is to be found in his mordant autobiography: "There was such a moral beauty about Church that they could not help taking him" for a fellowship. Stanley hailed his coming to St. Paul's with great delight. In point of literary style, Church's writing is nearly as good as that of his master, Newman. It is perhaps more perfect—perhaps too obviously perfect—literary English. But if the reader misses in Church something of Newman's grace and ease, he will miss also some of the rather careless freedom which the greater writer at times permitted to himself. Church, to turn back for a moment to what we were saying above, had the opportunity once to serve Newman in a very public and marked way. He was one of the two proctors who, after Ward's degradation and the condemnation of his book, interposed to prevent the Oxford Convocation from proceeding to the condemnation of Tract No. 90 and of Newman by the famous veto, "Nobis Procuratoribus non placet!"

REID'S LIFE OF LORD HOUGHTON.

The Life, Letters and Friendships of Richard Monckton Milnes, First Lord Houghton. By T. Wemyss Reid. 2 vols. Cassell & Co. 1890.

Richard Monckton Milnes, Lord Houghton, was an unusually interesting type of a kind of person characteristic of England, and indeed not to be found outside England—the man of fashion and society who is also something of a man of letters and something of a politician. Such men are plentiful and usually deserve no record beyond that of those who remember their good dinners. But when they evince exceptional capacity in any one of these three lines, their triple aspect makes them men of consequence, giving them, it may even be, a niche in the history of their times. Of Richard Milnes it may be said that he was really eminent in one of these lines, that of the man of society, and might perhaps, had he exerted himself, have been eminent in literature also, for though his work was scanty, it has quality; and though it is now but little read, those who read it are sure to value it.

He was born in 1809 — the birth-year of Abraham Lincoln, Tennyson, and Gladstone — the son of a wealthy country gentleman in southern Yorkshire, who had made a brilliant début in the House of Commons three years previously, but soon abandoned politics for the easier life of a landlord and sportsman. He was sent in 1827 to Trinity College, Cambridge, and had the good fortune to find himself there in the midst of a singularly able and brilliant group of undergraduates, some of whom afterwards became famous. To this group belonged Alfred Tennyson and one of his brothers, Thackeray, F. D. Maurice, John Sterling, Arthur Hallam, Edmund and Henry Lushington, James Spedding, C. R. Kennedy, and G. S. Venable. Connop Thirlwall, afterwards Bishop of St. David's, Whewell, and Julius Hare were tutors. To know and to be liked by these men was itself an education and an admirable start in the world. When he left the University, young Milnes travelled a good deal and began to write. His verses had considerable merit, and as their merit was aided by a *succès d'estime*, they soon made their way and brought reputation to their author. Presently, in 1837, he entered Parliament as member for the (now extinct) borough of Pontefract, and, after eleven years of service as an independent Tory, joined the Liberal party, showing, however, his old detachment from party ties no less in the new than in the old affiliation. In 1863 he quitted the House of Commons only to become, on Lord Palmerston's nomination, a peer, and continued to take a part, though not an active part, in politics till nearly the end of his life.

The advantage of a double or triple career like this is that success in one direction may bring consolation for failure in another, and that it makes life altogether fuller, richer, and more interesting than the career of a mere politician can be. Its defect is, that it almost invariably prevents a man from attaining the highest distinction in any one line. He who does many things well scarcely ever does one thing consummately well; and, in the press and competition of modern life, there really is not time, even for a man in whom the literary temper does not injure the capacity for practical work, to excel both in literature and in statesmanship. Milnes, however, was not really suited for politics. He had all the external aid that any one could desire, but his mind was too fastidious and critical to acquiesce in that subjection of individual impulse and opinion to the necessity of party co-operation which the party system of England makes imperative. Although he was a man of keen sympathy, he had not the power of divining and bringing himself into harmony with the main current of feeling in the people; and he was consequently liable to grave errors in judgment and foresight. His father, professedly a Tory, was in favor of the Reform Bill of 1832; he, fresh from the stimulating influences of Cambridge, was opposed to it. Subsequently he nearly lost his seat by advo-

cating a scheme which, whatever might be said for it on the merits, had never the least chance of success, viz , that of endowing the Roman Catholic clergy in Ireland. He felt bitterly Peel's omission to give him, in 1841, the post of Under Secretary for Foreign Affairs, for which his knowledge of the Continent of Europe seemed to render him specially fitted. Peel, it is plain to readers of this biography, thought him too light a weight for serious political work—more than sufficiently clever, but not likely to run quietly in harness, and capable of vivacious sallies or expressions of individual opinion which might embarrass his colleagues in the Government.

For social success, on the other hand, he had a rare combination of gifts—a quick intelligence, a lively wit, a kindly temper, infinite curiosity, especially about his fellow-men ; a great power of making himself pleasant, yet with sarcasm enough to be able to diffuse a slight sense of alarm—the whole coupled with just so much of singularity in his manners as gave a flavor of originality to everything he did. For fifty years he was a conspicuous figure in London society, knowing everybody worth knowing, and full of recollections of everybody who had been eminent in the generation next before his own. This social fame not only interfered with his success in politics, but with his literary reputation. Most of those who saw him in his later days had never read or had forgotten his poetry; and his prose writings, though always marked by grace of expression and refinement of taste, were comparatively slight, and addressed to a relatively small circle. But the almost unique position which he occupied enabled him to be of some service to literature in general, and to do many helpful acts to individual literary men. His biographer mentions a few out of countless instances in which he bestowed not merely money (which would have been, considering his wealth, no such great test of a good heart), but time and trouble upon those who had attracted his sympathy by ability and misfortune. Mr. Wemyss Reid has done well to bring out this, because Lord Houghton, who in all things loved paradoxes and enjoyed mystifications, wore, at any rate in his later years, an air of cynicism and worldliness which, though it was hardly noticed by intimate friends, who knew it to be superficial, often did him wrong with the world at large. Apart from these instances of benevolent aid to struggling authors, the book is full of proofs of Lord Houghton's sensitive tenderness and of the warmth of his friendships.

These friendships are the pleasantest feature in the biography. His inexhaustible interest in many sorts of subjects and men made him a sort of meeting-point for different social streams. Hardly any of his contemporaries was equally well fitted to be a common friend to persons unlikely to be friends to one another. Thus the book becomes an agreeable picture of the world of literature and politics in England from 1830 to 1870. From a great many entertaining anecdotes and letters we select a few of Arthur Hallam, who will go down to remote posterity as the "A. H. H." of Tennyson's 'In Memoriam.' Monckton Milnes wrote in 1828, when they were both undergraduates:

"I have a very deep respect for Hallam. Thirlwall is actually captivated with him. He really seems to know everything, from metaphysics to cookery." . . .

"Hallam opened at the Union [debating society] in a maiden speech against the decapitation of Charles I. last night, but he did not succeed very well. I opposed him at some length, but am afraid I was too flashy. Indeed, I find it hard to trace the line between passion and rant. . . . The London Union does not seem half so good as ours. Sterling [Carlyle's John Sterling] spoke splendidly, and Mill made an essay on Wordsworth's poetry for two and three-quarter hours which delighted me, but all the rest was meagre in the extreme."

The following deliverance from Victor Cousin (fall of 1829) is delicious :

"I had a delightful two hours' conversation with Cousin this morning, mostly on politics. One of his remarks was : 'What is it makes Lafayette a mere idol of the public, and B. Constant a *phraseur*, and Wellington and Peel mere engines of state? They are not metaphysicians. For a man to be now a statesman he must first be a philosopher.' He embraced me most affectionately."

Here are notices of two famous Germans whom Milnes saw at Bonn in 1830 :

"I am to be introduced to Schlegel [Augustus]. He thinks a great deal more of rank and political eminence than anything else, so I wish I could say that papa had been Chancellor of the Exchequer, if it was only for twenty-four hours. ["Papa" had been offered that office in 1806, but refused it.] He is insufferably vain of his person, though near seventy, and arranges his wig from a little looking-glass in his snuff-box, and ill-natured people say he rouges."

"Milnes [says Mr. Aubrey de Vere in some admirable pages of reminiscences of his friend] drew to us in 1831 a vivid picture of Niebuhr's profound grief at the downfall of the restored monarchy in France at the renewal of the Revolution in 1830. He was delivering a series of historical lectures at the time, and Milnes was one of the young men attending the course. One day they had long to wait for their professor ; at last the aged historian entered the lecture-hall, his form drooping and his whole aspect grief-stricken. 'Gentlemen,' he said, 'I have no apology to make for detaining you ; a calamity has befallen Europe which must undo all the restorative work recently done, and throw back her social and political progress perhaps for centuries. The Revolution has broken out again.'"

Another anecdote from 1830 : "I have only heard two stories by way of news : one that the Duke of St. Albans asked the showman of the Siamese boys, who you know are joined together, whether they were brothers ; and the other, that Prince Leopold, being recommended to read Plutarch for Grecian lore, got the British Plutarch by mistake, and laid down the Life of Sir Christopher Wren in great indignation, exclaiming there was hardly anything about Greece in it."

In 1844 the present Queen gave a state fancy ball which excited much curiosity at the time. Milnes, who had shortly before published his first volume of poems, announced his intention of appearing at the ball in the character of the poet Chaucer, in a dress the details of which were superintended by Macready. Wordsworth, as poet-laureate, had received an invitation to it, though not wholly pleased at having to begin his attendance on such revels at seventy-five years of age. The patriarch of English poetry, when told of the young poet's intention, exclaimed: "If Richard Milnes goes to the Queen's ball in the character of Chaucer, it only remains for me to go to it in that of Richard Milnes."

There are superb letters from Carlyle, too long to be here extracted; and some excellent sayings of Sydney Smith, together with some letters from him, one of which deserves quotation. Several epithets, or rather nicknames, to which Milnes objected had been given to him, and rumor ascribed their authorship to Sydney Smith. Milnes, who was still a young man, was annoyed at this, and wrote to his elderly friend a letter of remonstrance. Sydney Smith replied as follows:

DEAR MILNES: Never lose your good temper, which is one of your best qualities, and which has carried you hitherto safely through your startling eccentricities. If you turn cross and touchy, you are a lost man. No man can combine the defects of opposite characters. The names of "Cool of the Evening," "London Assurance," and "In-I-go Jones," are, I give you my word, not mine. They are of no sort of importance; they are safety-valves, and if you could by paying sixpence get rid of them, you had better keep your money. You do me but justice in acknowledging that I have spoken much good of you. I have laughed at you for those follies which I have told you of to your face; but nobody has more readily and more earnestly asserted that you are a very agreeable, clever man, with a very good heart, unimpeachable in all the relations of life, and that you amply deserve to be retained in the place to which you had too hastily elevated yourself by manners unknown to our cold and phlegmatic people. I thank you for what you say of my good humor. Lord Dudley, when I took leave of him, said to me, "You have been laughing at me for the last seven years, and you never said anything which I wished unsaid." This pleased me. Ever yours,

SYDNEY SMITH.

Many years afterwards Lord Houghton himself showed this letter to his present biographer, saying, "Don't you think that that was an admirable letter for an old man to write to a young one who had just played the fool?"

Of Milnes's own witticisms some good specimens are given, but we do not find one of the sharpest. It was addressed to a lady of rank who had been dilating to him upon her triumphs, and had wound up by saying, "In fact, I have had hundreds of men at my feet." "Chiropodists, I suppose," was the reply.

Of the sixty years of active life which these volumes cover, it is noticeable how much more interesting the first thirty, 1825–1855, are than the thirty which bring us down to the end of Lord Houghton's life in 1885. This is not to be explained merely by the greater curiosity which people feel about the generation whom they have not known as contemporaries. Any one who makes a list of the eminent Englishmen who flourished in the former period and compares that list with a similar one of the prominent figures of the latter period, will be struck by the superiority of the earlier generation and of the society of London then to the society of London now. The same remark is often made regarding France and Germany. One often sets such reflections down to the familiar *laudatio temporis acti*. But this Life has made us feel that there is some real foundation for the complaint that England has begun to enter a sort of period of eclipse, such as occasionally happens to all countries, and such as she experienced between 1720 and 1770.

It only remains to say a word as to the editorial part of the book. Mr. Reid has done his work with eminent taste and skill. If he has somewhat overstated the literary merit and social importance of his hero, this is a fault which may be easily pardoned to a biographer who was also an intimate friend. His own remarks are so just and so pertinent that we are sometimes inclined to wish he had given us more of them. He has been scrupulously careful to avoid wounding the susceptibilities of living persons—a task very difficult in dealing with the correspondence of a man who heard so much and said so much about his fellow-creatures; and he has succeeded, while not concealing the vanities and oddities of Monckton Milnes, in making him live before us not only a very bright and clever, but a very kindly and genial man, in whom many of the best features of diverse and even opposite types of character and profession were happily blended.

ERICSSON.

The Life of John Ericsson. By William Conant Church. 2 vols., 8vo. Charles Scribner's Sons.

JOHN ERICSSON was born July 31, 1803, at Longbanshyttan, in the mining district of Nordmark in Sweden. His parents were well educated and well off, but when John was about eight years of age his father failed in business, and the family was reduced to poverty. Olaf Ericsson removed to Forsvik, where he obtained a position as engineer, and gave his two boys every advantage which he could obtain for them. John made remarkable progress in mechanical drawing, and, with his brother Nils, was finally appointed a cadet in the mechanical corps of the Swedish Navy. Through the patronage of Count Platen, he was afterwards employed as engineer on the Göta Canal. He next entered the army, where his skill in topographical drawing stood him in good stead. In 1825 he made the first of his recorded inventions—an engine in which air heated by a flame expanded in a cylinder. This was the germ of the caloric engine of his later years. In May, 1826, Ericsson went to England on leave of absence, but eighteen months later resigned his commission in the army and began his mechanical career. He soon became intimate with John Braithwaite, a manufacturer of machines, and afterwards formed a partnership with him. His fertility of invention showed itself in a number of contrivances, of which we need only mention a hot-air engine, a plan for transmitting power by compressed air, a boiler with artificial draught, and a surface condenser for steam-engines. The two last, in principle, at least, are still in use. The invention of the steam fire-engine followed in 1828, and was received in England with violent and, for a time, successful opposition. Gradually, with improvements, it everywhere replaced the old hand-machines.

In April, 1829, the directors of the Liverpool and Manchester Railroad offered a prize for the best locomotive engine. A trial took place on the 8th of October of the same year, the competitors being George Stephenson with the *Rocket*, Braithwaite and Ericsson with the *Novelty*, and three others of little or no account. Stephenson had all the advantage of experience, having been for five years at the head of an establishment for making such locomotives as were in use on colliery tramways. He had five months' time to construct his engine, and was also able to test it on a railroad before the final trial. Braithwaite and Ericsson had but seven weeks in which to build their engine, and no opportunity to test it. Stephenson's engine was better and more solidly built. The trial was on a piece of road only two miles long, and the competitors were obliged to run backward and forward over less than two miles of track. Owing to various defects in workmanship, the *Novelty* could not complete the required distance, and the prize was awarded to Stephenson. The *Novelty*, however, easily ran past the *Rocket*, and the sympathy of the press and the public appears to have been strongly with Ericsson. We have the testimony of Couper and Vignoles that the *Novelty* ran with them on one occasion at the rate of fifty miles an hour.

After a number of inventions which were at best only partially successful, Ericsson returned to his air-engine. Robert Stirling obtained a patent somewhat in advance of Ericsson, but his engine was never practically successful. In 1833 Ericsson devised his regenerator, an apparatus by which the hot air going out after expansion in the cylinder communicated heat to metallic tubes, which, in their turn, served as sources of heat to the entering cold air. The principle of this contrivance was really a very old one, and had also been used by Stirling. Practical difficulties prevented the general use of the caloric engine, but small pumping-machines are still in use, and very recently a splendid success appears to have been obtained by the hot-air engine of Woodbury, Patten & Woodbury. A number of minor contrivances followed, but we will name only a very successful deep-sea sounding instrument depending on the compression of air.

In October, 1836, Ericsson married Amelia Byam, a young lady of good family, handsome, and a fine musician. As he himself said, however, Ericsson was not fitted for domestic life. His wife followed him to America, but soon returned to England, and the two never met again. They continued, nevertheless, to correspond, and Ericsson contributed liberally to his wife's support.

In 1836 Ericsson devised a screw propeller, the form of which was afterwards copied for the steamer *Princeton*. The next year he made a small working model, and in 1837 he designed an engine for driving the propeller by the direct action of the pistons upon the shaft, a method of fundamental importance, and the parent of the modern system of screw propulsion. Various unsuccessful attempts had been made to replace the paddle-wheel by the screw. Of these the most noteworthy is the Archimedean screw of Francis Pettit Smith, a contemporary rival of no mean achievement. Ericsson patented his invention, and in 1837 launched upon the Thames the *Francis B. Ogden*, a vessel only 45 feet long, which towed a schooner of 140 tons at the rate of seven miles an hour. The Lords of the Admiralty could not, however, be induced to adopt Ericsson's plans. One misfortune followed another. The firm of Braithwaite & Ericsson failed. Ericsson was sent to the Fleet, but finally secured his discharge in bankruptcy. Other successful screw propellers were built by the assistance of his friends Ogden and Stockton, but Ericsson was, as usual, too far in advance of his age. The new system slowly forced itself upon the attention of practical men. Robert F. Stockton, a lieutenant in the United States Navy, and a man of wealth, intelligence, and political influence, saw the value of the invention, and a vessel was built for him by the Lairds at Birkenhead, and proved a signal success. Several smaller vessels were also constructed and were successful, but the inertia of an unintelligent public opinion could not be overcome. Ericsson decided to remove to the United States, and arrived in New York March 23, 1839. Within ten years afterwards twenty-four merchant vessels had been fitted with screw propellers. Stockton secured an order to build a frigate of 600 tons for the navy, and the *Princeton* was begun in 1842. All the plans for this vessel were drawn by Ericsson at Stockton's request, Ericsson leaving his remuneration to the generosity of the Government. Stockton paid Ericsson $1,150 for his services to himself, assuring him that there would be no difficulty about his pay from the Navy Department. Ericsson gave Stockton a bill and receipt for $1,150, and Stockton then used this to extinguish Ericsson's claim against the Government, and Ericsson was never paid.

Ericsson had brought with him from England a wrought-iron gun in which hoops or rings were shrunk upon the breech in two superposed layers. Stockton constructed a similar gun of bad material imperfectly welded, but bored and finished under Ericsson's direction, and called the Peacemaker. The story of the bursting of this gun on board the *Princeton* February 28, 1844, is familiar to all. The *Princeton* proved, however, a great success. Stockton claimed the whole merit of her construction, and in a report to the Navy Department did not even mention the name of Ericsson. The *Princeton* was the first successful application of steam in naval warfare. The genealogies of inventions are always hard to trace, and the claim of Ericsson to the substitution of the screw for the paddle-wheel has of course been disputed, though it is not difficult to show that others only attempted to do what he succeeded in doing. The direct action of the piston upon the shaft of the screw has, we believe, not been claimed by others. The *Princeton* was the first steam ship-of-war in any proper sense of the term; the screw, boiler, and machinery being placed beneath the surface of the water.

Ericsson again took up his plans for hot-air engines. He made great advances in theory and practice, and decided to apply the principle to a large vessel. The "caloric" ship *Ericsson* was accordingly built, and on February 16, 1850, made a trial trip to Washington. The speed of the vessel was, however, only eight miles an hour. On her return to New York she was struck by a tornado and sank. She was raised, but it was finally decided to take out the hot-air engines and convert her into a steamer. We can hardly do otherwise than regard the *Ericsson* as a failure, but Ericsson never lost faith in the final success of the principle of the engine.

The breaking out of the Civil War in the spring of 1861 gave Ericsson a long-desired opportunity. The Confederate Government early began the construction of iron-clad vessels, and in July, 1861, Secretary Welles recommended the appointment of a board to inquire into the necessity of constructing armored steamers or floating batteries. Both France and England had at the time a number of iron-clad steam vessels, no one of which resembled in any respect the plan which Ericsson proposed. The board, September 16, 1861, reported in favor of three plans: Ericsson's floating battery; a broadside vessel of 3,266 tons, afterwards known as the *Ironsides;* and lastly the *Galena*. This last vessel was designed by C. S. Bushnell, who was subsequently associated with Ericsson in building the *Monitor*, and whose very interesting letter to Secretary Welles, written long afterwards, is well worth reading. A contract was at last secured, and even before the usual formalities were completed the keel of the *Monitor* was passing through the rolling-mill. The vessel was put into commission, under command of Lieut. Worden, on February 26, 1862. We must pass over many interesting details which even now it is impossible to read without emotion. The story of the memorable battle between the *Monitor* and the *Merrimac*, March 9, 1862, need not be related here. Ericsson always maintained that if the officers of the *Monitor* had had a few weeks' practice with the vessel, the *Merrimac* would have gone to the bottom on the very first discharge of the fifteen-inch gun in the turret. As it was, Ericsson's triumph was complete, and he was overwhelmed with congratulations at home and abroad. Congress passed a vote of thanks. Russia and Sweden at once accepted the *Monitor* as the solution of the problem of naval attack and defence. On the 16th of March succeeding, Ericsson received and accepted a proposition to build six gun-boats on the plan of the *Monitor*, and later two monitors of the larger

class, the *Dictator* and the *Puritan*, one of which, against Ericsson's urgent and in the end successful protest, was to have two turrets.

The *Monitor* was sent up James River, and withstood without injury a heavy cannonade from forts. O her successes followed. Capt. Worden with the *Montauk* destroyed the Confederate ship *Nashville* under the guns of Fort Macallister. The *Manhattan* gave the finishing blow to the ironclad ram *Tennessee* in Mobile Bay. At Fort Fisher the monitors lay for three days under fire, with the loss of only three men. The first shot from the fifteen-inch gun of the *Weehawken* knocked down forty men on the ram *Atlanta*, which, after two or three more shots, surrendered. Finally, the *Miantonomoh* crossed the Atlantic in perfect safety, while the *Monadnock* rounded Cape Horn and reached San Francisco. The success of the monitor system was complete, but the strong opposition of ignorance, prejudice, and class pride was but slowly and partially overcome.

At an early period of his life Ericsson had devoted much thought and study to the subject of "sub-aquatic" attack, his plan being to discharge an explosive projectile from a tube lying near the bottom of the attacking vessel and with valves at each end. After various plans, he constructed in 1877–78 a vessel called the *Destroyer*, and in 1880 he was able to announce that from this vessel a torpedo was discharged two hundred and seventy-five feet in a direct course under water. In the navy this project met with both opponents and defenders, but in the end was rejected.

In his old age Ericsson devoted himself to the construction of a sun-motor or engine—air or steam—to be moved by the reflected heat of the sun. A certain measure of success was attained in this way. The first motor was constructed in New York in 1870. Ericsson made a large number of experiments in solar radiation, and continued to work in this field with his usual energy until his death on March 8, 1889.

In his best years Ericsson was strikingly handsome and possessed of immense bodily strength. With some very marked faults of character, and as he grew old with much eccentricity, he possessed very noble qualities. He was generous even in his poverty, supported needy relatives, and forgave mean enemies and treacherous friends, while his long life of eighty-six years was full of usefulness and of good deeds. The picture of Ericsson's old age painted by his biographer with truthful colors is well worthy of contemplation. It is the portrait of a man in whose strong face there are still lines of weakness. Col. Church has done the work which Ericsson intrusted to him with great labor and with more than charity. He has written one of the best and most interesting biographies on record. There is, perhaps, a little too much detail, and yet no reader will regret it. In concluding our notice we may be permitted to express the hope that Ericsson's letters to and from other engineers will be collected and published. They must contain the inner history of much of the best mechanical work of our century.

How the Other Half Lives: Studies among the Tenements of New York. By Jacob A. Riis. Charles Scribner's Sons. 1890.

THIS book exhibits two tendencies that are especially prominent in these latter days. One is the disposition to study the pathology of society, to examine the manner of life of criminals, paupers, beggars, and incapables generally; the other is the propensity to regard social therapeutics as consisting in a change of material conditions. As to the first of these tendencies it is probable that the general softening of manners has led to a positive increase of benevolent feeling. More persons are sincerely disturbed at the thought of human misery, and more persons are in position to interest themselves in any movement that has for its object the relief of this misery. But on the other hand, with the softening of the heart, there tends to come a softening of the head. Much learning of slums and sweating-houses has made some social reformers mad, and acquaintance with the hideous details of human depravity and wretchedness has resulted in wild outcries against the government of God as well as the government of man. Nor is it to be denied that the exploiting of these horrors has sometimes been undertaken for sensational purposes, for the gratification of that uneradicated if not ineradicable taste for whatever is foul, which finds a more exquisite satisfaction in the filth of fact than in that of fiction.

Mr. Riis, however, has evidently been animated by the best of motives in making this study of the dark side of life in the city of New York; and while he is occasionally overcome by the appalling character of the sights that he has personally witnessed, his account of them is generally marked by sobriety and self-restraint. He does not quite lose sight of the fact that not all dwellers in tenement-houses are on the point of starving to death, or live under vile conditions. His aim is to let us know the worst, and it is not surprising that especial emphasis should be laid upon whatever intensifies the darkness, but he allows us at least to see that there is another side. His book is by no means so thorough and even scientific as that compiled by Mr. Booth upon East London, but it is an excellent presentation of many superficial aspects of the life of the poor in a great city. He takes us with him on his visits to Gotham Court and Cherry Hill, to Chinatown and Jewtown and Little Italy, to "The Bend" and "Hell's Kitchen" and "Murderers' Row," and he tells us what is there to be seen and heard and smelt. There is much sameness in it all, and the difficulties of the situation are as manifest at the beginning of the tour as at the end. These difficulties Mr. Riis does not seem to us fully to appreciate.

For he is an illustration of the second tendency of which we have spoken. In his view the tenement-house is the root of all evil, and the only hope of improving the characters of degraded human beings consists in improving their dwellings. There is something to be said in favor of this view, but Mr. Riis offers sufficient evidence of its insufficiency. So long as the administration of penal law is what it now is, so long as the treatment of the inmates of penal institutions is unchanged, so long as some of our charitable institutions are managed as they are, and so long as the city of New York continues to be the common dump of the outcasts of the world, the building of improved tenement-houses will not put to flight the powers of evil. Almost the only people whom Mr. Riis heartily denounces are the landlords. It is their greed that is responsible for the wickedness and misery of their tenants. But unless they live in tenement-houses themselves, it is evident that character is not determined by the nature of the residence; and it is instructive to find Mr. Riis elsewhere maintaining that this selfsame greed, by turning itself to the construction of buildings for business purposes, has accomplished more good than all other reformatory agencies.

The truth is, that Mr. Riis has grappled with a more extensive problem than he supposes. It is not difficult to devise remedies for the evils that he describes. The difficulty lies in the application of these remedies. Given a mass of human beings leading lives of which it is desired to raise the standard, how shall this be done when the government of society is in the hands of these people? A benevolent despot could make New York clean, healthy, and beautiful for less money than is now spent in keeping it dirty, unwholesome, and hideous. He could equalize wages by putting a stop to the tyrannical monopoly of trade unions; he could raise wages by preventing the influx of workers contented with a low standard of living and of workers for whom there was no place. He could, at the same time, increase wealth by subjecting idlers and criminals to a reformatory discipline that should only terminate with their reform, and by saving the waste of misdirected and pauperizing alms. But how shall these things be done by the very people whom it is desired to elevate? How shall the tenement-house be reformed by the dwellers in tenement-houses?

Desperate as the situation is, the spectacle of the devoted labors of countless noble workers to better it is grand and exhilarating. The mere money poured out in charity that is known is computed to be $8,000,000 a year, and much giving by the right hand is unknown to the left. More valuable than money is the wealth of love and sympathy and Christian endeavor that flows like a river from both rich and poor. Mr. Riis gives most encouraging testimony as to the results of these labors; in his opinion the situation is improved ten-fold over what it was a few years ago. It is demonstrated that tenements in which self-respecting people may live can be made to pay a fair return upon the capital invested, and the great work of the Charity Organization Society renders the labor of the benevolent far more effective. Mr. Riis is not always discreet; he seems to give his assent to the extraordinary proposition that American women who reside in the country ought not to sew upon cheap clothing, because they come into competition with a degraded class of immigrants that choose to herd like pigs in the slums of the Tenth Ward of New York. But he has given his readers much material for thought, and his book is to be commended to those who wish to be informed as to the nature and extent of tenement-house life. The photographs with which the work is illustrated are not very clear, and quite fail to suggest the squalor that they are intended to represent.

Emblematic Mounds and Animal Effigies. By Stephen D. Peet, Editor of the *American Antiquarian*. Chicago: *American Antiquarian* Office. 1890. 8vo, pp. 351. Illustrated.

THESE mounds have ever been a stumbling-block in the path of the American archæologist, and it is with a feeling of regret that we are forced to confess that there is nothing in the present volume that is calculated to remove the obstacle, or that can, in any way, help us to a satisfactory conclusion in regard to the origin and uses of these structures. The questions involved are difficult—some of them, perhaps, are impossible of solution; and it was no doubt for this reason that almost all the writers who have thus far grappled with the subject, have dealt with it in the cautious manner that befits an investigation in which

many of the factors are, and must from the nature of the case remain, unknown.

Regarded from this point of view, the contrast between this work and those that have preceded it is very marked; for although, as a matter of fact, our author repeatedly admits that it is not always easy to identify these animal-shaped figures, yet it is very evident to any one who will take the trouble to examine the volume, that he is not embarrassed by doubts upon this or any other point upon which he finds it necessary to express an opinion. Thus, for instance, when referring to the disagreement between Lapham and himself as to the likenesses that are said to exist between certain mounds and the animals which, it is supposed, they were intended to represent, he tells us (pp. 23, 45, 54, etc.), that that writer "called birds crosses, and panthers lizards"; and that "he seemed to lack the faculty of imagination, or some other quality, which should have enabled him to trace the resemblances in the right direction." We are also told (p. 79) that "naturalists, as a class, are not acquainted with the habits and haunts of the animals, and are poor in their representation of animal life." "A surveyor" (p. 29), it is thought, "who is able to take accurate measurements and then to plot the effigy, is most likely to be accurate in his conclusions," though even he would fail unless possessed of "some imagination . . . so that the contour and complete figure can be given," since "a mere mechanical plotting will not convey the idea of resemblance."

This certainly makes short work of Lapham and the whole tribe of naturalists, but it does not satisfy our author. He now goes a step further, and, having brushed aside (p. 76) the "ordinary surveyor," and (p. 79) all but a few sportsmen, he assures us (p. 70) that when speaking of the attitudes of the different animals as represented in these mounds, "the points which he makes are perceptible to him while they are imperceptible to others," thus closing the door, so far as he was able, to all possible contention.

Being thus informed of our author's qualifications, there is, of course, no occasion for surprise at anything that occurs. Accordingly, when we are told (p. 6) that an animal-shaped mound described by Lapham as having several humps on its back, "is a moose," or when (p. 51) certain figures are identified as fishes, though "the shape of the fish is lacking," we recognize it as a proof of the superior insight by means of which our author discerns likenesses that either do not exist, or are not visible to ordinary mortals.

These, however, are but special instances, and do not give us an idea of the flights of fancy in which he indulges when treating of these mounds collectively. Thus, for example, although he speaks (pp. 27, 29, 70, 87, etc., etc.) of the liability to mistake these resemblances on account of "the size" of the mounds, their "indefiniteness," "the obliterations" made by time, and the "strange distortion" that was practised, yet he finds no difficulty in identifying the figures of fifty or more different kinds of animals, some of which, in size and shape, are as much alike as rabbits and hares, hawks and falcons, and weasels, minks, and skunks. Indeed, in one case, he is so far carried away as to assert that "the lofty flight and extensive vision" of the eagle is shown—a statement that may well be doubted in view of the limitations supposed to be inherent in this kind of work. Nor is this all, for, forgetful, apparently, of what is said about the indefiniteness of these animal-shapes and the difficulty of recognizing them, he tells us (pp. 53, 78, 80, etc., etc.) that they are formed with "remarkable skill," "are life-like," "true to nature," etc., etc.; and this in face of the fact that no two observers agree in characterizing them, and that Lapham, whose account of them is the best that we have, cautions us against accepting these resemblances, and does not hesitate to say that there is no evidence that the figures which "for convenience" he calls lizards, but which, according to our author, are panthers, were intended to represent the lizard, or an animal of any kind. In fact, our author himself admits that it is sometimes hard to distinguish between these different shapes, and (p. 302) he figures an animal which "may be taken for a mastodon or a coon," depending upon which end is regarded as the head.

But while we are not insensible to the wonder-working power of the imagination, there are times when it is inadequate to the demands made upon it. Take, for example, the statement (p. 50) that the eagle is never represented with a forked tail, and how is it possible, even in fancy, to reconcile it with the figures (pp. 37, 91, etc.), in which eagles are pictured with forked tails; or, how, by any exercise of the imagination, can we justify those references to Lapham in which, unintentionally no doubt, that writer is made to see (pp. 6, 38, 88) a moose, a serpent, and a game-drive, when he either says nothing of the sort, or so qualifies his assertion as to make it comparatively useless in an investigation which is or ought to be based on facts? But enough of this. From what has been said, a good idea can be formed of our author's peculiar method of work; and if we have dwelt upon it longer than its importance merited, it was because this portion of the work was chiefly descriptive, and it seemed probable that here, if anywhere, a careful observer might be expected to avoid inconsistencies and reckless assertions even if he did not attain accuracy.

Of the various purposes for which these mounds are said to have been erected, of their hidden significance, or of the motives, religious and otherwise, which are supposed to have actuated their builders, we have not the space to speak. Fortunately, however, the loss from this cause cannot be great, as these are matters about which nothing definite is known. Anything, therefore, that we might say would be more or less speculative, and hence of but little value in an investigation of this character. That some of these mounds may have been intended as clan emblems is possible, and so, also, it is possible that serpent worship, in some form, may have existed among the people who built them; but that they manifest (p. 96) "a strange mixture of material symbolism, of religious tradition, of tribal custom, and of wild life," are subjects about which we certainly know nothing, and after a somewhat careful examination of our author's utterances upon these and kindred topics, we do not find that he is much wiser. Theories he gives us, any number of them, and some of his statements are very positive upon matters that are supposed to be beyond the reach of human effort; but the evidence to sustain them is often lacking, and even in those cases in which facts are brought forward to support his positions they are not always to the point. In an investigation of this sort, we need not remind him, facts are wanted, not speculations, and those facts, to be of any weight, must be relevant.

In conclusion, we may be permitted to say that we do not object to the inference that these mounds were, in all probability, the work of some one of the Dakota tribes (pp. 249, 289, 297), "presumably the Winnebagos." So far as we know anything about the matter, there is no reason why they might not have built them, though we do not see how this statement can be reconciled with the fact (p. 133), if it be a fact, that "the effigy-builders possessed a different cultus" from the modern Indians, and that while we should perhaps call them Indians, "they were Indians of an unknown tribe." The two statements conflict, and it requires a stronger imagination than we happen to possess to bring them into harmony. Such inconsistencies, unfortunately, are only too frequent, and they make it difficult to take this book seriously.

Record of the Life and Work of the Rev. Stephen Higginson Tyng, D.D., and History of St. George's Church, New York, to the close of his Rectorship. Compiled by his son, Charles Rockland Tyng. E. P. Dutton & Co. 1890.

MR. TYNG'S loyal and affectionate record of his father's life is in two parts. The first, comprising eight chapters, is mainly autobiographical—the first three chapters purely so; the others, with additional notes, explanatory and illustrative. While the second part does not disappoint the expectations which it properly excites, it is much less interesting in its manner than the autobiographical portions of the preceding chapters. These give us first an over-dose of family history, from which it appears that Dr. Tyng was an Episcopalian by long ancestral right; indeed, that he was more Episcopalian than Tyng by native right, his father's name having been Dudley Atkins till it was changed to meet the wishes and receive the doubtful inheritance of the last of the Tyngs in Tyngsborough, Mass. He was a direct descendant of Gov. Dudley of Massachusetts, and on his mother's side from Francis Higginson, the first minister of Salem, whence, possibly, an evangelical strain of blood tempering that from the paternal side. The century was exactly two months old when he was born in Newburyport, Mass. When eleven years old, he went to Phillips Andover Academy, and got no learning, but much piety from the proximity of the Theological Seminary. Here was the first not merely conjectural influence working him to an evangelical temper. Between meetings on Fast Day, 1812, he engaged in an impromptu prayer-meeting with five other students, and all six became distinguished clergymen. This shows the quality of his environment. In 1814 a sermon by Dr. Gardiner Spring, then preaching in Newburyport, confirmed the Andover impression.

He graduated from Harvard College in 1817, in the class which started Caleb Cushing on his dubious career, and which also gave us the late George Bancroft. A brief period of commercial life followed his graduation, in the course of which he was converted in the instantaneous manner than which Wesley recognized no other. He studied theology with Bishop Griswold of Connecticut, whose temper was so evangelical that he had prayer-meetings, then a daring novelty in the Episcopal Church. Thus steadily impressed, young Tyng entered the ministry in full possession of those Low Church principles which dominated his career. Theologically he was not a good Episcopalian, for his theology was always Calvinistic, not Arminian; finding its centre not in the doctrine of the Incarnation, but in the doctrine of the Atonement. He was a conspicuous representative of a religious tendency foreign to the natural bent of his church, and

he fought for it a losing battle. There are less to do it reverence every year.

His first of many controversies—he was in hot water off and on his whole life through—was in Georgetown, D. C., with his first bishop to whom his Calvinism was an abomination. His next settlement, in Prince George's County, Md., was the most interesting of the five in his succession. He had not, as he reckoned, a Christian in his congregation. He preached in taverns, and his texts were "straight out from the shoulder" every time: "The show of their countenance doth witness against them"; "Woe unto them that rise up early in the morning to follow after strong drink," and so on. From 1829 to 1834 he was Rector of St. Paul's, Philadelphia, and from 1834 to 1845 of the Church of the Epiphany in the same city, and here he had his first phenomenal successes in preaching and church organization. In the Onderdonk controversy he was with the Pennsylvania Bishop until it became a question of his personal character, but against the brother in the New York bishopric throughout, not believing Onderdonk guilty, but holding that his influence for good was gone. But it is difficult to resist the impression that Dr. Tyng had ever a keener scent for theological than for moral obliquity. In Philadelphia began his passionate interest in Sunday-schools—another example of his fondness for the methods of the unepiscopal churches and his desire to engraft them on his own.

In the second part of the biography, we have first a history of St. George's Church, New York, with which, after 1845, Dr. Tyng was identified for the remainder of his life. Dr. Milnor had made it a fit garden for his successor's Calvinistic seed. Here Dr. Tyng found full scope for his organizing force and skill. In numbers and financial strength the church became a fine and proud success under his administration. This, as felicitously expressed by his eulogist, was that of a "judicious autocrat." The biographer is at pains to show that his father was not an extremist in his anti-slavery views. The wonder is that he should ever have been thought so—for he was a colonizationist after the Fugitive-Slave Law—until we remember that one did not have to be extreme to be considered so in the days of that iniquity. When the war-time came, Dr. Tyng was quick enough to draw the moral of emancipation. Later he was a strenuous fighter against the ritualist party and for Episcopalian "liberty of prophesying" in non-episcopal churches. Of the free intellect he had no conception, and for its activity nothing but vehement denunciation. The dogmas of the Church were for him infallible truth, and any doubt of them was sin.

Dying September 3, 1885, he lived long enough, before the clouding of his intellect, to see the growth of tendencies which to his mind were full of evil promise. He had other cause for sadness in the waning of his great success. When his mind was much enfeebled, his automatism, as the new psychologists would say, was still equal to the most copious extemporaneous prayer. Take him for all in all, there is small chance that we shall see his like again in his Church, which is getting further every year from his ideal. There is not a suggestion of his vigorous and effective personality in the frontispiece engraving, which presents a face of the most approved ecclesiastical inanity.

Grundzüge der Bibliothekslehre, mit bibliographischen und erläuternden Anmerkungen. Neubearbeitung von Petzholdts Katechismus der Bibliothekslehre von Arnim Gräsel. Leipzig: J. J. Weber. 1890. 12mo, pp. xii., 424.

THE first edition of Petzholdt's 'Katechismus' was published in 1856, the third (substantially unaltered) edition in 1877. His grasp of the subject and the general correctness of his views are best evinced by the large part of the original book which Dr. Gräsel has been able to retain. This new revision is thorough, and the editor has brought the work up fully abreast of the latest ideas. The catechistic form has been abandoned; the material has been rearranged, partly rewritten, and greatly augmented; notes have been added epitomizing the opinions of the most important dissenters from the conclusions which Dr. Gräsel himself adopts, and citing with praiseworthy care and fulness the literature upon each point discussed. American librarians cannot fail to be gratified at the just preponderance, among these citations, of references to the *Library Journal*. It was scarcely to be expected that a German, writing in and for German conditions, would adopt every device approved by the experience of American libraries; but dissent does not imply disapproval—on the contrary, a chief merit of the book lies in the author's constant recognition of the fact that the system found best for one library may not be at all good for another.

In the introduction, Dr. Gräsel defines his subject and describes its principal literature, both books and periodicals. The text he divides into two main parts: first, of the building, personnel, and finances; second, of the books. The first part occupies eighty-five pages and consists of three chapters, the longest being devoted to the much controverted subject of buildings. The second part, which extends to 230 pages, is also divided into three chapters. The first chapter considers the establishment of the library, the cataloguing, the shelf-arrangement and numbering, and the care of the books. The second chapter treats of the increase of the collection, *i. e.*, the nature and sources of accessions, the accessions-list, binding, and the incorporation of accessions among the books already assembled; the third chapter, the use of the books, divided into General rules for readers, Reference use, Lending use. The text is followed by seventy pages of notes in fine type and eleven pages of index.

In such a mass of details we can glance at a few only of the more important. The remarks on buildings are certainly not novel; it is the same sad story of cross-purposes, failure of the architect to consider the purposes of the library, failure of the librarian to understand that there are some architectural impossibilities and may easily be many architectural monstrosities; for America, one may add, failure of trustees to use patience or even decent consideration towards either party. Still, it is interesting to find that the practical defects which Mr. Poole, for instance, finds in most of our library buildings, including some of the most splendid, have also come to light, or rather to darkness, in many of the architectural palaces that house Continental libraries. Any one who has tried to read in the twilight that reigns at high noon in many alcoves at Wolfenbüttel or Munich will heartily echo these sentiments:

"In building stalls for horses and cattle, one seldom forgets to consider whether location and plan are sufficiently adapted to the ends for which the building is intended, and whether in its arrangement proper attention has been paid to the needs of its future inhabitant, the cherished cow; why is it not reasonable to ask that the same question should receive equal attention in planning for a library building the milch cows' stall to which thousands of thirsty scholars resort?"

Cataloguing is discussed at some length. No specific rules are given, but the writer attempts to state those fundamental principles upon which the cataloguer in any library, by paying due regard to its peculiarities, should be able to frame a working code. He pronounces in favor of an alphabetical author-catalogue, with full, perhaps too full, titles, and a briefer systematic subject-catalogue. The dictionary catalogue is an inadequate substitute for these two, and a third catalogue, alphabetical by subjects, a luxury. He would gladly see the use of manuscript catalogues by readers more generally allowed than is common in Germany, but cannot convince himself that it is possible to grant all readers that free use of manuscript catalogues which has been permitted for years not only in the principal libraries of America, but also in the British Museum. The system of shelf-classification he considers a matter to be settled by each library for itself. Still, he admits that general systems, while they cannot be expected to fit equally well the few symmetrical collections and the many deformed, may nevertheless offer valuable suggestions to a librarian who is attempting to solve his own concrete problem.

On the whole the 'Grundzüge,' although they form more properly a new book than the revision of an old one, offer few novelties. Yet it is possible, without unfairness to several other good books, to regard Dr. Gräsel's as the most important single publication on library economy since the issue of the Bureau of Education's special report on 'Public Libraries in the United States.' The intervening fifteen years have seen the establishment of the American Library Association and the Library Association of the United Kingdom, each publishing a successful journal, and the birth of the *Centralblatt für Bibliothekswesen*, the *Bulletin des Bibliothèques et des Archives*, the *Rivista delle Biblioteche*, and the *Anuario del Cuerpo Facultativo de Archiveros, Bibliotecarios y Anticuarios*. A great number of valuable observations have been made and some useful conclusions reached. Dr. Gräsel has skilfully summarized the most important of them, and at the same time, by means of his bibliographical notes, has furnished a useful index to the most important papers on different parts of library economy available either in the technical periodicals or elsewhere.

Les Communes françaises à l'époque des Capétiens directs. Par Achille Luchaire. Paris: Hachette & Cie. 1890.

SINCE the appearance of Carl Hegel's epoch-making work, a great number of studies have appeared upon the origin of the mediæval municipalities and their constitutional forms, but there has been need of some trustworthy work, not written to advance any particular theory, but presenting the best results of recent investigations and giving a general view of the whole movement. This need, so far as France is concerned, has now been met by this volume of 300 pages from the distinguished historian of French institutions. The book does not present the results of special studies of the author's, but aims to present his interpretation of all recent investigations in a connected account of the communal movement as a whole.

On the question of origin, the author holds that no trustworthy evidence has been presented for the Roman theory, and that not

much better can be said for the German. The essential element of the commune as an institution—the confederation formed by the inhabitants under the guarantee of a mutual oath—is an application of the common mediæval practice of association for all sorts of objects, a practice which is neither exclusively German nor Roman in its origin, but universal. In some cases, at least, the commune appears as only a transformation of some one of these local religious or commercial associations into a wider association of the whole body of citizens. The communal revolution itself grows, like all such movements in history, out of a need of the time—the need of the people to protect themselves against feudal exactions.

An especial feature of the book is the clearness with which the author presents this idea, the communal movement as an outgrowth of feudalism, analogous to the contemporary and later peasants' revolts. The whole process is regulated and controlled by the forms and ideas of feudalism. The commune, when successfully established, becomes in its corporate capacity a feudal person, with all the rights and duties implied in that idea. The territory of the commune is transformed from territory directly subject to the suzerain into a sub-fief, as in any other case of subinfeudation, and the city through its representative offers the vassal's oath and receives the oath of its lord. In this capacity of feudal person the commune has its right of local legislation, of independent jurisdiction, and of maintaining an armed force, and it may also in this capacity have vassals of its own. Of course, in every case this feudal position is not perfectly realized, but the tendency is always towards this result.

In showing, however, the origin of the general impulse to the formation of communes, one has not explained the origin of the special communal institutions, and here there is yet large room for investigation. It seems clear that many of these institutions are of much earlier origin, and are adapted by the commune to its new needs. The *échevins* descend, without doubt, from the *scabini* of the Frankish county organization. Here it may be possible in the case of some cities to trace a Roman influence upon single institutions, though it must be carefully remembered that the continued use of a name does not indicate in the least the continuance of the institution. In general, it must be kept in mind that what characterizes feudal society as a whole is also a characteristic of the communal side of it—that forms of institutions and phases of right and privilege differed widely in different localities. This is, of course, still more the case when we step outside the bounds of the nation; and a work similar to this on the German cities would show decided variations from the French type.

Mrs. Thrale, afterwards Mrs. Piozzi: A sketch of her life, and passages from her diaries, letters, and other writings. Edited by L. B. Seeley, with nine illustrations after Hogarth, Reynolds, Zoffany, and others. New York: Scribner & Welford. 1891.

Mr. Seeley has a more hackneyed subject to deal with in this volume than in his similar popular and pleasing accounts of Horace Walpole and Fanny Burney, but he succeeds as well as the nature of the case allows in interesting his reader in Mrs. Thrale's side of Johnson's association with her. The story, so far as Johnson is concerned, is too well known to permit of any freshness; the most that Mr. Seeley can attempt is to show how this friendship affected Mrs. Thrale's happiness, what kindness and patience she exercised towards her guest, and how well she bore herself at the end, when Johnson wrote that violent letter to her with regard to the marriage with Piozzi. On the whole, we think Mrs. Thrale gains the more her circumstances are looked into. She was mated, not by a love-match, with a husband whose treatment of her was certainly lacking at times in respect and delicacy, and she served his interests and tastes with entire fidelity; she did not fail in the obligations which the kindness of the house alone imposed on her, towards Baretti or Johnson, and both of them were inmates of trying temperaments and habits. She was both intelligent in literary conversation and able in financial affairs, so that she assisted her husband in his business difficulties as much as in entertainment to his friends. When Mr. Thrale died, her own nature asserted itself more independently, and finally she married the man she loved, Piozzi; and because he was an Italian and a musician the world was scandalized, her old friends made brutal attacks on her, the press laughed at her, and altogether she was made to suffer whatever society can invent in the way of annoyance in such a case. The story of her life with Piozzi, her various books, and her long social career after her return to London, is the freshest portion of the volume; and whether Piozzi or herself be looked at, the result is wholly honorable to them. She owes her remembrance, of course, to her relation with Johnson, but she was herself a remarkable woman, of very diversified talent, full of energy and feeling, and successful in what she undertook. Mr. Seeley has brought out her qualities admirably, using old material, it is true, but revamping it; and he has added, as usual, a number of admirable portraits of Reynolds, Baretti, Garrick, and others which are an ornament to the book.

The Philosophy of Fiction in Literature: An Essay. By Daniel Greenleaf Thompson. Longmans, Green & Co. 1891.

Mr. Thompson writes in a style half-way between the philosophical and the literary upon the well-beaten topic of the right method of fiction. He asks wherein the interest of a novel lies, and then proceeds to show what part in its composition is taken by the merely reproductive and the merely creative faculties of the mind. He summarizes the naturalist theory as expressed by Zola and Guy de Maupassant, and illustrates his position from the critical writing of the latest French and English essayists; and at the end concludes that the idealists have the best of the argument—largely because the realists are found to use ideal methods to a certain degree. There is nothing very novel in the discussion, and perhaps attention would not be attracted by it were it not that, toward the close, the author enters on the question of the propriety of fiction including in its survey the erotic motives. His view is conservative, but at the same time sufficiently frank, and in our judgment more than sufficiently tolerant. He says that American fiction, however we may blind our eyes to the fact, has already lost the purity that once characterized it; and while he does not confuse his mind with any illusion as to the real ground of the popularity of these works of our later days, he seems disposed to accept the facts of popular taste and to allow more latitude of subject and treatment of what has been hitherto tabooed among respectable readers. We note the expression of these opinions, in a work professedly philosophical and openly moral in its claims, as a sign of the drift of the times. That many novels hitherto considered immoral are in circulation among us, though little noticed by the press, is an open fact. The justification of them by criticism is yet to come, and to this point the author has not arrived; but the tone of his remarks is an indication of the extent to which old standards are becoming relaxed, and, if we are not at fault, this relaxation is in reality much greater in the minds of the reading public than has yet appeared in the printed expression of literary opinion. The influence of French criticism, following French novels, may perhaps account for Mr. Thompson's views.

BOOKS OF THE WEEK.

A Delsartean Scrap-Book. U. S. Book Co. 25 cents.
Anderson, E. P. The Best Letters of Madame de Sévigné. Chicago: A. C. McClurg & Co. $1.

FEBRUARY

EDUCATIONAL REVIEW.

Edited by NICHOLAS MURRAY BUTLER, Ph.D., Professor of Philosophy in Columbia College, President of the New York College for the Training of Teachers.

Assisted by E. H. COOK, Ph.D., Head-Master Rutgers Preparatory School, New Brunswick, N. J.; WILLIAM H. MAXWELL, Ph.D., Superintendent of Schools, Brooklyn, N. Y.; ADDISON B. POLAND, Ph.D., Superintendent of Schools, Jersey City, N. J.

Contents:

The Educational Value of College Studies. Simon N. Patten.

Is there a Science of Education? II. Josiah Royce.

Time and Age in Relation to the College Curriculum. E. Benjamin Andrews.

Heredity and Education. Amory H. Bradford.

Discussions:
The Forty-sixth Meeting of the Massachusetts State Teachers' Association, G. I. ALDRICH—The Illinois State Teachers' Association, NEWTON C. DOUGHERTY—Public Disputations, THOMAS HUGHES—The Fourth Annual Meeting of the American Economic Association, EDWIN R. A. SELIGMAN.

Editorial:
The Prussian Commission on School Reform—Three University Reports—A New Agent for the Slater Fund—The American Society of Naturalists' Appeal—Poverty and Compulsory Education—Waste of Energy in City Supervision—Elementary Science Teaching.

Book Reviews.

Education in Foreign Periodicals: The German Emperor's Address to the Commission on School Reform.

Subscription, $3.00 per year (10 numbers); 35 cents per copy.

Henry Holt & Co., N. Y., PUBLISHERS.

New German Texts. JUST READY.

STORM'S IMMENSEE. With Notes and Vocabulary by Wilhelm Bernhardt, Ph.D., of the Washington, D. C., High School. Cloth, 50 cents; paper 30 cents.
RIEHL'S FLUCH DER SCHONHEIT. With Notes by Calvin Thomas, Professor of German Language and Literature in Univ. of Mich. Paper, 25 cents.
HEINE'S POEMS. Selected and annotated by Professor H. S. White of Cornell Univ. Cloth, 75 cents.
SCHILLER'S DER GEISTERSEHER. With Notes by Prof. E. S. Joynes of South Carolina College.

READY SOON:

HILLERN'S HOHER ALS DIE KIRCHE, with Notes.
STIFTER'S DAS HAIDEDORF, with Notes.
GORE'S SCIENTIFIC GERMAN READER, with Notes and Glossary.

Correspondence with teachers and professors of German is solicited.

D. C. HEATH & CO., Publishers, 5 Somerset St., Boston.

Two Scholarships for Women.

The Harvard University Examinations for Women

Will be held in New York June 23, 25, 26, and 27, 1891. Two scholarships of $300 and $200 each are offered in connection with these examinations. For information apply to the Secretary, 32 East 33d St., New York city.

Our Dictionaries and Other English Language Topics.

By R. O. WILLIAMS. 12mo, $1 25.

CONTENTS: I. The Growth of Our Dictionaries (with four facsimiles of Title-pages and Frontispieces). II. The Word "Metropolis," as used in England and America. III. Some Peculiarities, Real and Supposed, in American English. IV. Good English for Americans. V. Cases of Disputed Propriety and of Unsettled Usage. VI. Indexes.

"I have read every word of it and like it very much, and think it will do good. . . . There is hardly anything in it that I should not heartily endorse."—*Prof. William Dwight Whitney, Yale University.*

"Have read it with great interest and profit."—*Prof. Tracy Peck, Yale University.*

"I have read it through incontinently."—*Prof. Basil L. Gildersleeve, Johns Hopkins University.*

"Am glad to recognize in its teachings the tendency towards freedom of movement and of growth in our language."—*Prof. Thos. R. Price, Columbia College.*

"Prepared with painstaking care, and evinces scholarly candor and taste."—*Prof. T. W. Hunt, College of New Jersey.*

"A neat and entertaining bit of work."—*Prof. Edward S. Joynes, University of South Carolina.*

"There is a lightness of touch, a reserve of manner, a crispness of style, a seasoning of humor . . . which ought to make the book much more popular than I dreamed a book on such a subject could be without suffering some species of degradation."—*Prof. Albert S. Cook, Yale University.*

"Contains all sorts of information on out-of-the-way points that was new to me."—*Prof. Simeon E. Baldwin, Yale University.*

"Sensible and scholarly throughout."—*Prof. Isaac N. Demmon, University of Michigan.*

Henry Holt & Co., NEW YORK.

SILVER, BURDETT & CO., *PUBLISHERS,* 6 HANCOCK AVENUE, BOSTON.

QUARTERLY REVIEW.—ORIGINAL Edition. $4.00 per year. LEONARD SCOTT PUB. CO., 29 Park Row, New York.

Roberts Brothers'

NEW BOOKS.

DREAMS.

By Olive Schreiner, author of 'The Story of an African Farm.' One volume, 16mo, cloth, with portrait of the author, $1.

CONTENTS—1 The Lost Joy. 2. The Hunter. 3. The Gardens of Pleasure. 4. In a Far-Off World. 5. Three Dreams in a Desert. 6. A Dream of Wild Bees. 7. In a Ruined Chapel. 8. Life's Gifts. 9. The Artist's Secret. 10. I Thought I stood—— 11. The Moonlight Fell Across My Bed.

The success of this author's former book insures a full measure of appreciation for the new volume. Although not a continuous story, it shows the same strength of thought and power of expression, and it is in every way a remarkable book.

The Future of Science.

By Ernest Renan. One volume, demy 8vo, $2.50.

"The real subject of my book," says M. Renan, "is science, and by this I mean the exercise of human reason in its highest form. I speak particularly in the work of historical sciences, of which I have made a special study. I consider history as the science of humanity, and on this point only do I touch upon the social question."

MIRÈIO.

A Provençal Poem. By Frédéric Mistral. Translated by Harriet W. Preston. 16mo, cloth, $1.25.

Admirers of this popular poem will be glad to have it in a new and attractive form.

At all the bookstores. Mailed, postpaid, on receipt of price by the publishers,

The Nation.

NEW YORK, THURSDAY, FEBRUARY 12, 1891.

The Week.

TREATIES of reciprocity have a natural tendency towards free trade on an enlarging and widening scale. It was for this reason that the treaty of reciprocity with Mexico was favored by the advocates of tariff reform some years ago, and it was for the same reason that it was shelved by the protectionists in the House of Representatives. It is for this reason that reciprocity with Canada, whether on a large or small scale, has been generally favored by the former and generally opposed by the latter in time past and is so now. The arrangement made with Brazil does not carry any such implications for us, because the articles admitted free of duty to our ports are already free independently of the new arrangement. Coffee, the chief article of export from Brazil to this country, has been free of duty for nearly twenty years. On the other hand, there is nothing in the new arrangement to prevent us from putting a duty on coffee or sugar, or any other Brazilian product, if our revenue requirements should make it necessary. The arrangement runs "on and after April 1, 1891," but has no fixed period of continuance. Accordingly, it is terminable by either party upon reasonable notice. It amounts, therefore, to the free admission by Brazil of certain products of this country which are now taxed, and to the admission of certain other articles at a reduction of 25 per cent. on the general Brazilian tariff without any action on our side. There is nothing to prevent Brazil from extending the same advantages to any other country that does now or may hereafter admit her products free of duty. Therefore we cannot say how much advantage we shall gain by the arrangement.

The idea that this country has been losing some $60,000,000 a year by trading with Brazil, which has been sedulously maintained by high public authority at Washington, finds an echo in an interview with one of our merchants published in the *Times* of Friday, in these words:

> "In my opinion every product on which the 25 per cent. reduction is made can now be sent profitably to Brazil from America. At present the United States pays Brazil over $70,000,000 annually and only gets $9,000,000 in return. I think that in three years Brazil will be paying us in return for our manufactures and products over $25,000,000 a year, and that great sum will be in active circulation throughout the commercial veins of the country."

According to this calculation, we shall still be $45,000,000 out of pocket each year, and although this will be better than our former plight, we may well ask how long we can stand it. Phrenologists ought to take some steps to find out why the Yankees will go on trading with the Brazilians at such a fearful sacrifice, when there is not a tribe of dwarfs encountered by Stanley in Central Africa, or of full-grown savages by the most enterprising explorer in Borneo or in the bush country of Australia or in the hill country of Thibet, that would continue it six months after their chieftains had shown them that they were losing money by the operation. Mr. Blaine has been promising us a prosperous trade with South America, but if he cannot do better than to cut our losses down from $61,000,000 to $45,000,000 per annum, then thank you for nothing. We lost, according to him, $49,000,000 in 1889 in our trade with Cuba, and, we suppose, had the same ruinous experience last year.

Friday was a very disastrous day for the free-silver-coinage advocates. They were voted down 8 to 4 in the House Committee, and were defeated in their efforts to have their bill made a rider to the Sundry Civil Appropriation Bill. The outlook for the passage of the bill by the House is now more dubious than ever—so dubious, in fact, that Mr. Bland, one of its most strenuous advocates, says he considers the bill as already dead. He made the amusing declaration, on leaving the Committee meeting in high dudgeon, that the bill had been "smothered" by the action of the Committee in allowing delegations from various commercial bodies in all the largest cities of the land to appear and make arguments against it. That is the first time we remember to have heard of a measure being "smothered" by publicity. It is very evident that what is "smothering" it to its death is the aroused intelligence of the country, which is rapidly awakening to a proper sense of the financial disorder which a descent to the silver standard would bring about.

Mr. Michael D. Harter, Congressman-elect from the Fifteenth District of Ohio, has been interviewed on the silver question by the Canton (Ohio) *News-Democrat*. Being asked what would be the effect of free coinage of silver, he said that it would drive $600,000,000 of gold money out of circulation and contract the currency to that extent, and that "this would mean general bankruptcy compared with which 1857 and 1873 were years of prosperity and periods of abundance." Being asked whether free coinage would not be an advantage to some people, he replied that it would be a benefit to all holders of silver bullion, because every person holding 75 cents' worth would wake up and find that he could pay 100 cents of debt with it; but since not more than one man in 10,000 of the population has a silver mine, or any silver bullion, the bill would be the worst kind of class legislation to benefit a few at the expense of the many. Asked, further, if free coinage of silver would not benefit the debtor class, he said that the debtor class consists mainly of the employers of labor, who owe wages to their workmen, while the creditor class consists of the millions who have wages due to them, or deposits in savings banks and in building associations, and life-insurance or other claims payable in money, all of which it is now proposed to scale down from the gold standard to the silver standard, *i. e.*, 20 per cent. Mr. Harter said that he did not know one owner of a silver mine, or one holder of silver bullion, in his district, but he did know of 160,000 men, women, and children who were vitally interested in getting pay for their work and for their claims of every sort at the rate of 100 cents on the dollar, instead of 80 cents. Being asked what would be the effect on the Democratic party if it were identified with free coinage, he said that the party would lose all the Eastern States that it carried last November, and that the free-coinage issue "would not bring into the Democratic column a solitary State in the Union" to make up for those losses. Mr. Harter is a Democrat, a manufacturer, and a tariff-reformer of pronounced views. He was elected to Congress last fall by nearly 3,800 majority in the district where Senator Sherman has his residence. His voice will be heard even more distinctly when he takes his seat in the next House.

The amendment of the Copyright Bill in the Senate is most unfortunate, not only because the change is not an improvement, but because it promises to postpone for possibly two years the national recognition of property in books and the national condemnation of the practice of robbing foreign authors. It is of vast importance to obtain this, even if the form in which it is obtained should be very imperfect. Large numbers of publishers among us justify this practice to their own consciences by the plea that the law does not forbid it. If it were forbidden by law, even by a very poor law, the reign of morality in this particular branch of business would be restored, and the legislation on the subject could receive subsequently any such improvement as experience might call for. It will not do, however, to despair as yet. There is not much time left to pass the bill as last amended, but there is time, and it ought to be diligently used. There is no great interest in the matter in this Congress, but there will certainly be less in the next—a fact worth remembering just now.

The Pension Appropriation Bill was passed in the Senate on Thursday. It appropriates for pensions for the year $133,173,085; for fees and expenses of examining surgeons, $1,500,000; for salaries of eighteen pension agents, $72,000; and for clerk hire, $400,000—a total of more than $135,000,000. During the discussion, Mr. McPherson inquired of Mr. Allison whether the amount appropriated in the bill would be sufficient for the year. Mr. Allison replied that he believed it would be, but admitted that there might be a deficiency of

five, six, eight, or ten millions. In other words, the expenditures for pensions during the year must reach at least $135,000,000, and may rise to $145,000,000. Nineteen years ago the annual appropriation for pensions fell short of $35,000,000, and General Garfield, as Chairman of the House Committee on Appropriations, said: "We may reasonably expect that the expenditures for pensions will hereafter steadily decrease, unless our legislation should be unwarrantably extravagant."

The rapid progress which the Senate is making in doing the public business since the attempt to pass the Force Bill was dropped shows that there was not the slightest necessity of a "gag rule" for any other purpose than to get that partisan measure through. An attempt was made to cultivate the idea that the Senate must abolish the system of free discussion in order to perform its necessary work, but there was never any sincerity in the claim, and its absurdity is now apparent to everybody. The only effect of the long controversy over this question is that the Senate must work harder from now until the 4th of March than it would have had to do if so much valuable time had not been wasted by the Republican Bourbons.

Senator Ingalls's speech explaining his attitude toward the Force Bill was chiefly remarkable for the attack which he made in it upon Messrs. Reed, McKinley, and Lodge. These three Republican leaders have been especially free in their censure of Mr. Ingalls because of his refusal to play the part of Czar in the Senate and crowd the Force Bill through that body in the same way in which Speaker Reed crowded it through the House. Now Mr. Ingalls "gets even" by saying:

"It was related that the streets of Jerusalem had been kept clean by every man sweeping before his own door, and he commended to the self-constituted guardians of the consciences of their associates (outside of the Senate Chamber) that they should observe a more frugal, prudent, and guarded husbandry of their disapprobation. Those leaders who had conducted the most powerful political organization known in American history to the most stupendous and overwhelming disaster received in its annals, might well pardon those who were disposed to doubt the infallibility of their judgment."

This is an entirely moderate estimate of the results of the Reed-McKinley-Lodge leadership; but what gives Ingalls a deeper sense of the "stupendous and overwhelming" character of the "disaster" is undoubtedly the part which he played in it. As he looks at "Judge" Peffer, with his "gruffly hoarse but low-toned voice, issuing from a sea of long dark beard flowing nearly to his waist," it is small wonder that his language towards Reed and Co. becomes "iridescent."

The Special Committee which Speaker Reed "packed" with great care and great disregard of precedent in such cases, for the purpose of not finding evidence in support of the charges against the Commissioner of Pensions, Gen. Raum, have concluded their labors, and are about to present a majority report declaring that they have been entirely successful, and that no really damaging evidence against Gen. Raum was able to get a hearing in their presence. The Democratic minority intend to present a quite different report, but of course the House will pay little heed to that, and will adopt the "whitewashing" verdict. At the same time we doubt if there is an intelligent person in the country, who has followed the inquiry, who will be influenced at all by the majority's finding. We observe that several Republican newspapers are saying that this finding will be a great disappointment to Democrats and Mugwumps, since they are responsible for the assault upon the Commissioner, and will be humiliated by its failure. This view is based upon a misstatement of the facts. The leading assailant of the Commissioner was the Washington correspondent of the New York *Tribune*, who was ably and bravely sustained in the editorial columns of the paper. There are no signs yet that the whitewashing verdict has produced a change of attitude in this high Republican quarter.

A bill which seems to be in some respects a closer application of the principles of the English Corrupt-Practices Act than the New York law is, has been introduced in the Minnesota Legislature. It is the first American bill of the kind, we believe, which imitates the English requirement of a limitation for campaign expenditures. It limits the amount expended by candidates for State offices, United States Senate, and Congress to $1,000; that by candidates for offices in cities of over 15,000 inhabitants to $500, and that by candidates for offices in all smaller cities and towns to $250. It requires both pre-election and post-election publication of expenses, which is a new departure. It provides that fifteen days before election each candidate shall file a sworn statement with the proper officer, "showing in detail all moneys or other considerations contributed or expended by him, or promised to be paid directly or indirectly by him or through another person in aid of his nomination." After election, successful candidates are required to file similar statements of all expenses incurred in both nomination and election. The author of the bill, Senator McMillan, proposes to amend it to make it more stringent, and the first amendment ought to be one requiring sworn statements of expenditures in detail by all campaign and other political committees as well as candidates, for the failure to have such a requirement in the New York law has been shown in practice to make its evasion a comparatively easy matter. Senator McMillan is said to contemplate a provision forbidding candidates for United States Senator to incur any expense, and another making it a misdemeanor for any newspaper to sell its influence to any candidate.

Senator Saxton has given this State an opportunity to take the lead in a most important reform by proposing an amendment to the Constitution providing for the judicial settlement of all contests for seats in either house of the Legislature. As his bill is, we believe, the first formal step of the kind which has been taken in this country, though the subject has been discussed for many years both in relation to State Legislatures and Congress, it is worth while to quote its main provision in full. His bill is in the form of a concurrent resolution, proposing the amendment of section 10 article 3 of the Constitution, and making it read as follows, the added portion being italicized:

"Sec. 10. A majority of each house shall constitute a quorum to do business. Each house shall determine the rules of its own proceedings, and be the judge of the elections, returns, and qualifications of its own members, and shall choose its own officers. *But the Legislature may provide by law for judicial proceedings in the courts of the State to determine questions relating to contested seats in either house, and that judgment in such a proceeding shall be conclusive as to the election and qualifications of the person in whose favor it is rendered.* The Senate shall choose a temporary president when the Lieutenant-Governor shall not attend as President or shall act as Governor."

The provision which is embedded in all our constitutions, national and State, that each legislative body, Senate and lower house, shall be the judge of the elections, returns, and qualifications of its own members, was taken from the English, and dates back to the time in which there was no other place in which a power so susceptible of abuse could be lodged.

Aside from the partisan aspect of the matter, the expense attending the present system is enormous. According to Speaker Reed, during the last eight Congresses $318,000 has been paid for contests in the House, an average of nearly $40,000 a year. In addition to this a vast amount of time is consumed in the hearings which ought to be devoted to the public business. As to the transfer of the power to the courts, there is no question that the only way in which this can be done is by means of a constitutional amendment, as Senator Saxton proposes. In both national and State cases this must be done. Speaker Reed, who has earned the distinction of being the most partisan Speaker the American House has ever had, favors the transfer, declaring that our present system is "unsatisfactory in results, unjust to members and contestants, and fails to secure the representation which the people have chosen." He thinks that if Congress were to authorize settlement by judicial tribunal, and this tribunal's decision were to be acquiesced in by Congress for a few years, "there would spring up such a consensus of opinion that ever afterwards the House would cease to do more than record the decisions of the tribunal." He thinks that if the proposed bill for the relief of the Supreme Court could be passed, the number of circuit judges would be so increased as to enable the tribunal to be formed of them, and this would probably afford the most desirable material. In the various States the higher courts would have to be drawn upon, and there is no reason to fear

that their influence and standing would be in any way impaired by the duty.

A telegram from London informs us that the exports of cutlery from Sheffield to the United States have fallen off one-half since the passage of the McKinley bill. This is rather more than the American manufacturers of pocket-cutlery, who met in this city a few weeks ago to decide how much they should gouge the public, anticipated one year ago. These patriotic gentlemen held a private convention before the McKinley bill was reported from the Committee of Ways and Means, to decide what rates of duty they should ask for. Long experience had taught them the trick of asking for double what they expected to get, because former Committees of Ways and Means had been moved by conservative notions, and had generally assumed that all sorts of grabbers would put their demands higher than they ought to be, and had accordingly reduced them about 50 per cent. But, much to the surprise of the cutlery-men, McKinley gave them all that they asked for. Some of them were then ashamed that they had asked for so much, but all were alike astonished at the ease with which the money of the consumers had been voted to them. Fifty per cent. ad valorem would seem to be a sufficient tax on the public for their pocket-knives. That was the rate before McKinley took the job of lifting up the Republican party tariffwise. The McKinley rates are as follows:

Pen-knives, pocket-knives, and erasers, or parts thereof.	Rate.
Valued at not more than 50 cents per doz.	12c. per doz. and 50 per cent.
Valued at 50c. to $1.50 per dozen	50c. per doz. and 50 per cent.
Valued at $1.50 to $3 per doz.	$1 per doz. and 50 per cent.

These are the rates that were asked for by the cutlery-men. What they expected to get, and would have been entirely satisfied with, were specific duties of 6, 25, and 50 cents per dozen in addition to the former ad-valorem rate. The situation in which they now find themselves is excellently planned for the formation of a Trust.

The French protectionists have reached the McKinley state of mind and are demanding complete isolation from the outer world, and as much dearness as the law can give them. Apropos of the proposed denunciation of the commercial treaties with a view to a revision of the French tariff, M. Bourgeois, the French McKinley, attacked the Government for making certain reservations in its denunciations, and for proposing to retain in the treaties the "most favored nation" clause, which he pronounced "damnable" (*maudite*). France, he said, was, in matters of trade, fully sufficient unto herself, and he asked scornfully what had she "to do with abroad," and showed how greatly the domestic exceeded the foreign trade. In fact, with one's eyes shut, one might, in listening to his speech, have fancied one's self hearing the familiar drone of the Reed-McKinley organ. He was, it is true, repeating a good deal of the stuff which was talked by his party in the canvass before the last election, but wisdom has increased since then. M. Ribot, the Minister of Foreign Affairs, overwhelmed him in an eloquent speech, in which he protested vigorously against the notion that any nation could in this age of the world live alone, and warned the Chamber that the industries of exportation can only live by allowing abundant importation. He carried the Chamber against Bourgeois by 450 to 10—a terrible defeat for the ultras.

Twelve francs per hundred kilos is said to be the rate of duty intended to be put on pork by the French Chamber, in lieu of the prohibition heretofore decreed against the American product. This rate is equivalent nearly enough to one cent per pound, and is quite as good as prohibition for all purposes of protection to the French swine-herds and pork-butchers. We suppose that everybody in this country—at all events, every supporter of the McKinley Bill—will be entirely satisfied now. Surely Minister Reid ought to be, for he expressly told M. Ribot that we had no complaint to make against any rate of duty that the French Government might impose, but only against the imputation put upon our meats by the decree of prohibition.

The fall of Crispi, largely on a measure of taxation, shows that the financial question is more central in Italian politics than might have been inferred from the subordinate place assigned it in the speeches before the last elections. Even as it was, the Prime Minister was pushed pretty hard by some of the Radical debaters, and the solemn assurance that there should be no increase in taxation was forced from him in defence—an assurance that returned to plague him afterwards. A prominent feature in the speeches of one of his opponents, Cavalotti, was what was called a "workingman's budget." It set forth the earnings and expenses of an actual family of four hard-working people in Florence, and showed what a fearful proportion of the total income had to be turned over to the Government in the shape of taxes. This budget was carefully worked over, and the data of indirect taxation verified, by Signor Vilfredo Pareto, who published his results in the *Journal des Économistes*. The family's entire earnings amounted to $476, and its outlay for the year came within $5 of that sum. But of this outgo of $471, no less than $113 had to be paid in taxes, direct and indirect, or 23 per cent. of the entire expenses of the family. The share of the royal treasury was $69, the city took $24, the province $2, and the remainder, or about $18, went into the pockets of protected manufacturers and agriculturists. As may be inferred from this last specification, Signor Pareto has no manner of doubt that a protective tariff is a tax, and one of his columns is made up of the various assessments levied upon this family of laborers by landed proprietors and manufacturers. Indeed, one of the greatest merits of this "budget" as an economic study is the careful working out to reasonable approximations of the indirect taxes in the form of tariff discriminations, to which the food and clothing of the poor in Italy are subject. For example, this specimen family laid out $41.20 on clothing; but that sum included a tax of $7.41, of which $1.28 went to the State and $6.13 into the pocket of the protected manufacturer. In like manner, the family paid out for bread $77.40, in so doing turning over to the State $7.22, to the city $2,69, and to the protected producer $8.85. Some of the heaviest taxes, such as those on sugar, rice, and petroleum, are purely for revenue, as no domestic product comes into competition.

Such a showing as this of Signor Pareto's—and he works it out in detail for twenty-two articles of consumption—suggests the burdens under which Italian labor has to stagger, makes intelligible the expanding Italian emigration, and shows what misery at home Italy's new policy of foreign aggrandizement is causing. It is highly instructive to turn from the lot of workingmen in protected Italy to examine the state of the case in free-trade England. Fortunately, we have at hand an analogous English workingman's budget printed in the *Nineteenth Century*, in 1888, by Miss Miranda Hill. This was for a man and wife and five children, and showed expenses of about $385. The significant thing is, that, taking all the articles included in this English family's list of yearly purchases, and confronting them with the English laws of taxation, it turns out that taxes of all kinds amounted to no more than 4 4-10 per cent. upon the outgo, or less than one-fifth the Italian rate. There is no doubt that an American workingman's budget, drawn up on a similar scale and with similar scientific accuracy, is a desideratum. The idea is certainly well abroad now that tariff laws are tax laws; but this is too often a vague idea. If a veracious showing could be made of the average earnings and expenses of a typical laboring man's family, and of the proportion of the expenses which might fairly be set down to the protective tariff, it would be a most effective document for the campaign of 1892.

King Humbert has succeeded in finding a new ministry, with an old Garibaldian and Radical aristocrat, the Marquis di Rudini, at the head of it. It is made up of very heterogeneous material, of some men of much experience, and of some of none at all; but even if it were homogeneous, the chances would be against its lasting very long. Retrenchment is absolutely necessary to save Italy from ruin, and retrenchment seems incompatible with the maintenance of the Triple Alliance. In order to hold her place in it, Italy has to maintain an army and navy about twice too large for her resources. As soon as Rudini begins to cut down, he will come into collision with Germany and Austria, who will bring pressure to bear on him through the King.

LAW AND THEFT.

One of the oddest and most unfortunate phenomena in the history of the copyright discussion is the appearance every now and then, when the Pirates are ready to throw up their hands and ask for quarter, of some moralist or theologian to cheer them up and encourage them to make some further resistance, by proclaiming that the poor men have done nothing wrong, and that we must not call them hard names or despitefully use them. One such instance was afforded by the uprising of Dr. Crosby to justify, or at least palliate, the Rev. Dr. Funk's operations against the 'Encyclopædia Britannica.' We now have another in the uprising of Mr. Freeman, the English historian, to protest against the harsh language used by some English writers towards the House of Representatives for failing to pass the Copyright Bill last session.

Touching Mr. Freeman's protest, in his letter to the Philadelphia *Press*, against the use of bad language towards the House of Representatives or towards the Pirates, we have nothing to say. The strength of one's language is partly a question of taste and partly a question of expediency. We ourselves thought the epithets bestowed on the House of Representatives by some English periodicals unjust as well as unwise. But what concerns us now is the reasons Mr. Freeman gives for deprecating vituperation. One of them is that all property, and especially literary property, is the creation of law, and that copyright is "a purely artificial privilege," and that, therefore, it is highly indecent to speak of persons who publish other men's works without paying for them, as "thieves" or "pirates." That the historian of English liberty should offer the world, in such a cause, the plea that property is the creation of law is very curious, because there is hardly a step in the creation of the present English Constitution, from Magna Charta down, which was not a protest, in some shape, against the doctrine that a man's moral right to his goods and chattels is at all dependent on the provision made by law for his protection in the enjoyment of them. The great doctrine that taxation without representation is a thing to be resisted with the sword if necessary, rests on the very proposition which Mr. Freeman denies. When Hampden refused to pay the ship-money because he had not voted it through his representatives, seven of the twelve judges decided against him, and his refusal was therefore illegal; but he persisted in it, nevertheless, to the death, and all Englishmen now hold his memory in reverence therefor. The amount was trifling, but, as has been finely said, if he had paid it he would have been a slave.

Property, in truth, in its moral aspect, is no more a creation of law than justice is. It was created, as justice was, by the appearance of a second man on the globe. On each of the two there then promptly descended that great moral obligation which the friends of copyright now seek to have embodied in legislation —the obligation not to steal and not to covet his neighbor's goods, his ox or his ass, his man-servant or maid-servant, his wife, "or *anything that is his.*" This obligation existed before either parliaments or kings, before even the Ten Commandments. It arose out of the very nature of things. Mr. Freeman confounds, as do thousands of inferior men, the question of right with the question of security. Law cannot give a man a moral right to the product of his labor, nor can it take it away from him, a good illustration of which rule is to be found in the institution of slavery. The law deprived the negro of all legal rights, but it could not touch any of his moral or natural rights. What the law does for property is to give it security. It can by denying security, as in the case of literary property, make it worthless, but it cannot lessen the owner's right to it. It cannot diminish the moral guilt of stealing it from him. What the apologists of Pirates mean, therefore, when they talk of the law as a "creator of property," is simply that no man can without the help of the law get from property the sum of those pleasures which make it valuable. This may be true; but how can this fact excuse in the forum of morals the man who avails himself of this absence of legal defence to appropriate as much of his neighbor's goods as he takes a fancy to? Is it possible that when Arabs strip travellers in the desert, the offence is not robbery, but a failure of the law to create property in watches, guns, and camels in that particular region?

Mr. Freeman, in like manner, when he comes to speak of copyright as "a special privilege," confounds plagiarism and piracy. This is the most fertile source of misunderstanding in the whole discussion. In nine cases out of ten, a Pirate put on the defensive defends himself against not the charge of piracy, but the charge of plagiarism; and, in nine cases out of ten, moralists who take up the cudgels against the existence of literary property try to show the innocence not of piracy, but of plagiarism. What is a plagiarist? It is, says the dictionary, a man "who purloins the words, writings, or ideas of another and passes them off as his own." Now, it is no easy thing to convict a man of this offence unless he makes long textual extracts. The ownership of an idea, and even of forms of expression, is generally very difficult to trace. The same idea often occurs to hundreds of men at the same time, and often finds very similar expression at the hands of hundreds of different authors or writers. Therefore defenders of literary property have never attempted to set up the doctrine of "property in ideas" which opponents of copyright are so fond of attacking. They have never maintained that it is or ought to be unlawful to use a thought uttered by one man for the moral or mental culture of another man, or of forbidding the reproduction, in one man's book or speech, of as many ideas of other men as he can collect or recast to suit his purpose. Authors or writers who do this a good deal, undoubtedly incur discredit by it with their fellows and the general public. It greatly damages a writer's fame to be rightfully accused of want of originality, or of imitation, or of getting materials at second hand. But no one has ever proposed to punish or restrain this sort of misappropriation by law. No one has ever contended for the infliction on the purloiners of other men's ideas of any penalty but ridicule or disgrace, although their name is legion and their depredations ruthless and notorious; and yet a very large proportion of the Pirates and their apologists expend all their strength in showing that one man may lawfully appropriate another man's ideas for his own use or behoof, or even present them to the world as the product of his own brain

What the champions of copyright, both national and international, assail is, not the appropriation of one man's ideas for another man's use and behoof, *but the sale of one man's ideas and forms of expression in open market by another man in competition with the author.* This is "piracy." This is what we ask to have stopped and punished by law. We do not say to Pirates, You shall not take the Blacks' Encyclopædia to your home and prepare articles and speeches or even books out of its rich stores of information, and, if you are dishonest enough to do so, give them to the world as your own, or absorb as much of the facts and ideas as your mental powers will permit. What we say is, You shall not, while denying the right of property in it in the hands of the original author or compiler, treat it as property in your own hands, and offer it for sale in competition with the man whom you are plundering. We do not know how much reflection Mr. Freeman gives to questions of jurisprudence, but we feel sure that he will see at a glance that a man who treats as merchantable goods in his own hands something he has taken away from another man, is estopped from denying that it was property in the hands of that other man. Anything capable of being property in one man's hands must be property in the hands of every man who has come by it honestly. That Funk can take from Black something which Black has made, and open a store for the sale of it, and deny Black's moral right to it, on the ground that the law has made no provision for Black's protection in the enjoyment of it, is a doctrine of such monstrous mien that, to be rejected, it needs but to be stated.

Property in books might be further defended against selling Pirates by an appeal to the Golden Rule, but it is not necessary. It ought to be sufficient to close the mouths of all moralists on this question by asking them how they would *feel* if, after having spent thousands of dollars and years of labor on a book, a perfect stranger were to step in, reprint it, and begin to undersell the original owner in the open market. An honest answer to this question from the first Pirate one met would settle the question in the eyes of all moralists. But, as we have said, the contention that goods in which A is doing a roaring trade were not property in the hands of B, who manufactured them, and from whom they were taken,

when set up by A, perishes at once through its absurdity. One does not need to draw on the finer feelings of one's nature to dispose of it, and we are quite sure that no honest man who looks at it in this light has ever listened to it without finding plenty of abusive epithets rise to his lips.

WOMEN AND MEDICINE.

No more important event for women has happened for many years than the decision of the Board of Trustees of the Johns Hopkins Medical School—under the pressure of a gift of a hundred thousand dollars from the women of the country—to open its doors to women students. It may be considered the turning-point, for this country, of the fate of women as physicians. It is not that there are not already women physicians who are thoroughly well educated (in foreign schools), and who have found the large and lucrative practice which their talents have deserved; and it is not that all women who practise (any more than all men) will hereafter be required to take the post-graduate courses of the Johns Hopkins school. But the secret of women's rank in medicine, *as women*, depends upon the ability of the best women to hold their own by the side of the best men; when that is gained, the women of humble talents will fall into rank beside the men of humble talents, and it will be a question of the skill of a particular practitioner, and not, as now, of a particular sex. Until that is done, the woman physician herself cannot help feeling that it is the first part and not the second part of her descriptive title that rises large in the consciousness of those who discuss and fix her standing in the scale of accessible medical attendants. It is, therefore, for its effect upon the position of women in medicine in general, even more than for its effect upon the knowledge of the women who shall enjoy its unapproachable facilities for instruction, that the opening of the Johns Hopkins Medical School forms an era in the progress of women towards the assumption of their natural responsibilities and duties.

The *Century* for February contains a remarkable series of open letters in which the subject is viewed from various different points of view. The things principally dwelt upon, aside from the one which we have already mentioned, are the facility with which coeducation in medicine is carried out in Europe and in the West, and the special advantages which women, if well educated, will have over men in many special kinds of medical practice. On the former head, Dr. Osler gives the results of his observations last summer in the Swiss medical schools, at four of which women are now attending on the same terms as men, and into one of which, that of Basle, they were admitted after the Faculty had asked for and obtained a definite statement from the University of Zurich as to the feasibility of coeducation in medicine. As is well known, the Paris Faculty throws open laboratories, dissecting-rooms, class-rooms, and hospitals, without any condition except the possession of the necessary qualifications; and women have studied side by side with men, since 1866, in Italy, Denmark, Norway, Sweden, and Belgium, as well as in Switzerland and France. In this country there are thirty-eight medical schools, of one kind and another, open to both sexes. As Dr. Folsom well says:

> "With more than a score of women in a dozen States filling medical appointments which are by law open to their sex only; with the number of the women doctors in this country now reaching the thousands, and with a demand for their services so great that, even if inadequately trained, they only too readily find employment; when women are admitted in Europe to opportunities for medical education on the same terms with men, it seems almost a work of supererogation to explain and defend such facts, or to attempt to reason why they should or should not be."

On the subject of the peculiar adaptedness of women to the medical profession, several of the writers make very pertinent remarks. People in health are apt to forget of what immense importance to the patient is the *Stimmung* in which his doctor leaves him after his daily visit; a woman's quick comprehension of and active sympathy with physical, and still more mental, suffering are sources of alleviation of which it is difficult to overestimate the importance. Dr. Susan Dimock was wont to say, in her lectures to her pupils: "If I were obliged in my practice to do without sympathy or medicine, I should prefer to do without medicine." But if a woman's delicacy and penetration are of consequence with ordinary patients, they are absolutely indispensable with women in insane asylums and penal institutions and reformatories. To quote the words of Mrs. Josephine Shaw Lowell:

> "To a depraved woman no man dares to show tenderness or pity; he must feel and show to her only the moral repulsion which her degradation arouses in him. Should he long to help her, to lift and succor her, he is powerless, and he cannot show her even the common pity of one human being for another who is suffering; she will not understand it, and it can do her no good, but only harm." But "the entrance into her life of an absolutely pure-minded woman, who is also strong, intelligent, and kind, is a revelation to her; when such a woman shows herself full of tender pity, the elevating influence is wonderful."

It is rather remarkable that not a single one of these writers has a word to say on the question whether the quirls of a woman's brain have any peculiarities which necessarily unfit her from profiting by the most advanced medical instruction. It may, perhaps, be considered that that question was settled once for all some twenty years ago, when, after the death of Dr. Susan Dimock, above referred to, in the wreck of the *Schiller*, at the age of twenty-eight, Dr. Bowditch said of her: "I found her one of the most accomplished physicians I have met"; and Dr. Samuel Cabot: "In her short life, she acquired, in the face of many obstacles, an amount of medical knowledge and of surgical skill such as but few possess. Her skill and self-command in operating no one can appreciate who has not witnessed it."

Not the least interesting piece of information communicated in these letters is that contained in Cardinal Gibbons's graceful recognition of women in their new rôle. In the course of it he says:

> "It is perhaps not sufficiently understood that there is no obstacle in ecclesiastical or canon law to the education of women for the medical profession. Among the persons inhibited by the Church from pursuing the profession of medicine are included priests, monks, and clergymen generally, but not women."

The fiat has gone forth that in Baltimore it is not immodest for women to study anatomy and physiology together with men. Undergraduate coeducation the Trustees may perhaps be expected to hesitate over for some little time to come, but the question of admitting women to post-graduate courses (as we pointed out in these columns upon the occasion of the opening of Clark University) is a totally different matter. No women go through with such difficult work as they presuppose (and no men either) unless they have minds thoroughly occupied with serious questions, and unless they are of an age at which they can be safely trusted to take care of themselves. Must the women of the country form a separate organization and raise a separate large sum of money in order to effect their entrance into the adult schools of instruction of each of the great universities, or will some boards of trustees be found who will be willing to take such eminently wise action upon their own motion?

ECONOMIC METHODS IN GERMANY AND FRANCE.

THE recent debates in the Prussian Diet and the German Reichstag concerning economic matters, and the floating of the new French loan, are of interest alike to students of finance and of that modern science known as the comparative psychology of nations.

The Prussian budget for the fiscal year 1891 to 1892 was submitted to the Diet by the Minister of Finance, Dr. Miquel, in a speech of studied soberness. On its face it is by no means a discouraging exhibit. As in the past ten years, there is no deficit, and no new loan will be called for during the present year. The expenditures are estimated at 1,720,800,000 marks ($413,000,000) and the surplus at 33,600,000 marks. But there is a falling off of 65,000,000 as compared with the surplus of last year; the just demands of Government officials for increased salaries are only partially met in the present budget, and the Minister calls attention to the fluctuating character of the income from the Government railroads, which has sunk from 42,000,000 in the preceding year to a little over 5,000,000. This falling off is partly due to the inundations which visited Prussia during the past year, but in a greater degree to the increase in wages and the price of coal. Herr Miquel had already last November, in his speech on tax reform, dwelt on the insufficiency of the average surplus of even the last ten prosperous years as compared with a national debt of nearly 6,000,000,000 marks, and he again warned the Diet against entertaining too optimistic a view of the condition of Prussian finances. He pointed out that the direct taxes, which ten years ago yielded 150,000,000 marks, had since then increased only to 156,000,000, purposely ignoring the great gain in the revenue from indirect taxation,

and, as is supposed, paving the way for an increase of the direct-tax rate.

Simultaneously, the debates in the Reichstag on the proposed abolition of the corn duties furnished an instructive commentary on the general economic policy of the Government of the German Empire. Germany has for months been negotiating with Austria-Hungary about a new commercial treaty, involving a reduction in the import duty on corn. The entire abolition of the duty was demanded by the Freisinnige and Socialist parties, and, until recently, was stoutly resisted by the Conservatives. The German Chancellor himself, in alluding during the debates to the necessity of concluding commercial treaties with Austria and Italy, referred to France and Russia as the countries which still maintain a policy of commercial isolation, and plainly intimated that he was by no means hostile to a reduction of the corn duties, the abolition of the sugar bounty, and other measures tending to lessen the cost of the necessaries of life. He thus furnished considerable encouragement to the National Liberals, whose leader, Herr von Bennigsen, some time ago declared that the conclusion of a commercial treaty with Austria would lead to the abandonment of the rigid protection policy of Germany. Indeed, not only Liberal papers like the *National Zeitung*, but Conservative organs like the *Post*, which was formerly the mouthpiece of Varnbüler and Kardorff, the chief apostles of protectionism, have sounded the death-knell of the economic policy of Bismarck, still upheld by him through the *Hamburger Nachrichten*.

"Protective duties," says the *Post*, in an article which has excited general attention, "are a rude weapon, precisely as a blow with the fist is. But if one is attacked and receives a blow, he must retaliate with one. Therefore, countries which indiscriminately and from purely selfish motives use protective measures against us, must be treated by us in the same manner. On the other hand, in regard to countries with which we are in intimate economic contact, and with which we are politically on good terms, everything should be done to promote, as far as possible, unrestrained commercial intercourse. We cannot keep up a commercial warfare with the whole world, nor is the rest of the world determined to wage war against us as do the United States and our neighbor east of us. We shall never succeed in promoting the interests of agriculture solely by complete or partial protection."

After an exciting four days' debate, the motion for the reduction of the corn duties was rejected in the Reichstag by a majority of 210 against 106, but the defeat of the Freisinnige and Social Democratic parties was more apparent than real, inasmuch as it is expected that the Centre party will vote for the commercial treaty with Austria in due time, having rejected Herr Richter's motion only in order to strengthen temporarily the Government. The present heavy majority for the retention of the existing duties will enable the German Government to demand of Austria important concessions in the matter of freight rates before granting the asked-for reduction of the import duty on corn to three marks and fifty pfennigs.

While Germany is thus evidently preparing to adopt a more liberal economic policy than she has pursued for many a year, the tremendous financial success recently achieved by the French Government is incidentally interpreted as a refutation of the arguments of the extreme French protectionists, whose excessive demands had caused the Government serious embarrassment. The preparations for the issuing of the loan were made with that desire for dramatic effect which the French carry even into their financial operations, and which contrasts so forcibly with the German method of dealing with similar problems. The floating of the loan was to be, if possible, an even more striking demonstration of the financial strength of France than was the subscription to the loan of 1886, which was covered twenty-one times over. The Government asked for 870,000,000 francs in 3 per cent. rentes, and was offered 14,500,000,000 francs, or sixteen and a-half times the amount of the loan, several institutions rather absurdly subscribing each more than the total amount of the loan. Thus, the Company of the Paris Agents de Change subscribed three times the amount of the loan, depositing 453,000,000 francs as security; the Crédit Lyonnais twice the amount, depositing 297,000,000, etc. The price at which the loan was issued was 92.55; and fully 2 per cent. more might have been obtained, had the Government not been willing to forego the difference in order to insure to the fullest extent the success of the loan. And this patriotic consideration overcame all the prudent misgivings of those who foresaw the frightful stringency of the money market consequent upon the withdrawal of the enormous sums that accompanied the applications. So great was the strain on the Bank of France that, according to the *Temps*, the bank was for a moment in actual danger of having either to suspend its discounts or draw on its cash reserve.

The exultation over the success of the loan is not in the least dimmed by the publication of the French budget for 1891, which shows 3,164,900,000 francs of expenses against 3,165,300,000 of receipts, and estimated advances of 58,000,000 to the railway companies, which will go to swell the floating debt, thus adding to a national debt which exceeds the gigantic sum of 30,000,000,000 francs. There is, nevertheless, in the abounding faith of France in her resources, in the eagerness of all Frenchmen, high and low, to evince their patriotism by placing their savings at the disposal of the Government, something which fills the German breast with envy. The Munich *Allgemeine Zeitung* justly says that, after making due allowance for the French liking for show and patriotic demonstration, there remains in France a clear perception of the wants of the average capitalist and of the best interests of the country.

"With us," that paper says, "until recently the opposite conditions prevailed. The issuing of loans long ago decided upon was delayed until the most favorable opportunity had passed, and capitalists, if they interested themselves at all, found neither pleasure nor profit in the transaction. In France the national wealth of the country and the solidity of her securities are placed in as bright a light as possible, while we dwell as much as possible on the dark side. Both methods are fraught with danger. In France, the inevitable reaction, brought about by possibly trivial causes, must result in serious losses to the holders of *rentes;* in Germany, Government securities can never claim the rank and value to which they are entitled."

THE MONUMENTS OF SOUTHWARK.

LONDON, December, 1890.

ONE wanders through Southwark now, as I did the other day under the guidance of one of the historians of the borough, with a kind of forlorn consciousness of the days associated with Chaucer and Shakspere, to say nothing of John Harvard. I was the guest the other afternoon of Canon Boger, the head of St. Saviour's School, and he led me to a bay window in the front of the master's house on the street named after Archbishop Sumner, and drew my attention to some ancient and lofty trees overtopping the ridge-poles of the neighboring houses, and said they were the last relics of the times when all this region was the garden of the palace of the Bishop of Winchester. Southwark is now in the see of Rochester, and in the midst of the rebuilding of the nave of St. Saviour's Church, the old St. Mary Overy's, the good bishop—not unknown to us in America from his visits there—would interest all Harvardians in the shrine that the probable baptism of John Harvard within its walls has sanctified in their memories. It is certain that the St. Saviour's School, which formerly stood adjacent to the church, had in those early days the father of John Harvard among its governors. Amid the changes which Southwark has undergone, so that most of the ancient landmarks are obliterated which connect it with names already mentioned, the school at which Harvard may have been a pupil, and which Queen Elizabeth founded, disappeared, and the building which it now occupies, nearer Southwark bridge, is already dingy with the damp and smoke of sixty years. But changes are not at an end. The forms have dwindled in occupancy under the increasing remoteness of the habitable regions of such families as furnish its pupils, and the time is not far distant when the school will have to remove to the suburbs to follow its pupils. The master's household is a bit of educated gentleness in the midst of incongruous surroundings, and the change must come.

St. Saviour's Church, with what there is left of it in the choir, shows the very beginnings of Early English architecture, before the Norman had lost its influence; and at the present moment this almost sole conspicuous surviving landmark of the Southwark of Harvard's day is undergoing restoration at the hands of the nineteenth-century builders. The nave, as I have said, is being entirely rebuilt, and when the work is done it is expected that the new See of South London will be constituted, and the old St. Mary Overy's will be the new Cathedral. The church was locked when we got to it, but a call at the sexton's house gave us the key; and as the heavy bolt of the north-transept door flew back and we pushed back the baize door within, we were at once at the side of the tomb of John Gower, with its recumbent effigy, his pillowed head being crowned with a laurel wreath. Thus St. Saviour's is associated with the very beginnings of English literature, as well as with the memory of that Englishman who gave the first practical impulse to the founding of education in New England. If the strange rudimentary English of Gower had little to attract that young scholar of St. Saviour's—as we may well believe him to have been a pupil of the school of which his father was a governor—there was a later literature as well as a later history associated with St. Saviour's and the

Bankside that a youth intended for the Church perhaps even then, and maybe possessing budding Puritan principles, may not have been unconscious of; while those evidences which lay about him might have given some strain to his devotional instincts. In the rear of the choir he may have wandered in that retro-choir which we can see to-day much as it was in those days of Bloody Mary when a Consistory Court condemned to the stake those Protestant martyrs whom Sir Gilbert Scott has so conspicuously commemorated in the Gothic monument which the stranger looks at with interest in Oxford. The upholders of the mimic scene were quite as striking figures in the boy's memory of what in Southwark he may have seen and must have heard. He could hardly have remembered the "forenoone knell of the great bell," as the church records tell the story, when Edmund Shakspere, in 1607, was buried in St. Saviour's, and when it is fair to suppose that the dead player's brother William was among the mourners. Indeed, this Church of St. Saviour's must be reckoned—if we are not too iconoclastic—among the three historic buildings, now standing, which the great dramatist may have seen. These are the Hall of the Middle Temple, where "Twelfth Night" was first acted, and where one of the benchers took me recently; Crosby Hall, mentioned by Shakspere as Crosby Place, a stately mansion of the fifteenth century, near Bishopsgate, where I remember once some of the officers of the British Museum took me to lunch in the restaurant which has been made of its fine old hall; and this Church of St. Saviour's, with its many dramatic memories, for here also are buried Fletcher and Massinger, the last called a "stranger" in the records of burial.

I strolled about the neighborhood of the church with my mentor, to see the site of the house where Harvard lived, that of the home of Shakspere, and that of the old Tabard Inn, where the Canterbury pilgrims gathered. Everything is changed, and recent structures, with their utilitarian purposes, confront the seeker for memorials. The old White Hart Inn, with its courtyard and crazy galleries, where and in the adjacent rooms the vilest poverty displayed its sickly rags, stood till within a very few years. We did find one of these old inns left in part, and, on one side of what was once an ample court, there was a range of galleries, still standing and not altogether fallen into disgrace; for the George Inn, as it is still called, harbors the marketmen who come in to sell their vegetables in the open ground on one side of St. Saviour's.

Where Shakspere's Globe Theatre stood is now a bit of property appertaining to Barclay & Perkins's great brewery, whose extensive building has done a good share of the destruction of old landmarks in this neighborhood. When one looks at the big property thus represented, one may think that its business manager might strut with some of the importance that we are told the great Doctor Samuel Johnson had, when, as the executor of Thrale, the brewer, he disposed of what is the nucleus of this vast estate. Hereabouts one sees at every turn some old name of Shaksperian flavor—the Bank End, the Bear Garden, the Falcon Dock; but the busy trains of the Southeastern rushing overhead dispel every lingering association.

There is yet a chance to save one's impressions in the house of an occasional antiquary. My guide took me to the establishment of the leading citizen of Southwark. In his private office he had varied his business energies with a study of the antiquities of the borough. The walls of a large room were hung with old prints and old drawings of all the landmarks, of historic association, which have now disappeared, and one could find great help there in rehabilitating the Southwark which had been known by Gower, Chaucer, Shakspere, and John Harvard.

There seems to be fair reason for supposing that the map of the New England coast which Capt. John Smith had made in 1616 was on board the *Mayflower*, and that it helped the Pilgrims to understand where they were when, beating about among the breakers off Nauset, they turned north and found a haven under the lea of Cape Cod. There was some improvement in this map in successive editions, with changes showing the settlements after Boston was founded, and when the interest in the young Puritan colony of Massachusetts Bay was attracting the attention of so many in the Puritan Emmanuel College of Cambridge. There was no other map likely to have been studied by those longing and expectant emigrants, for there is no certainty that the map made in manuscript by Gov. Winthrop and discovered a few years ago in the British Museum ever secured a general acquaintance among those smitten with the fever of emigration. There are two or three of these earliest manuscript maps, figuring our New England coast and unchanged by an engraver's fancy, which I shall make it a point to see before long. The most interesting bit of paper, perhaps, to a student of the broader aspects of American history is that to which Major directed the world's attention, several years ago, as being a sketch of the outline of the American continent, drawn by Leonardo da Vinci, and which is preserved among the drawings of that master at Windsor in the Queen's library. I saw it some years ago, when the late librarian of the Queen, Mr. Woodward, was alive; but since then there have been some dissentients to Mr. Major's judgment, and the connection of Da Vinci with it has been denied. For this reason I wish to see it again, and now that the Queen has left Windsor for Osborne, I hope to have the opportunity. Another is what is known as the "Figurative Map," preserved in the Dutch archives, and which embodies the results of the Hollanders' exploration of the New England coast, just about the time when Smith sailed and rowed along the reaches of the shore to make the sketches upon which he founded his map. I know the map well enough from the facsimile which was made for the State of New York a good many years ago; but the student well knows that he studies a facsimile with much more satisfaction after he has seen the original. The third is this map of Winthrop. I have not yet asked to see it at the Museum. There have been two glass negatives of it sent to America—one through the agency of Mr. Waters, and the other I myself sent for while I was engaged on work that required the seeing of it. I suppose the chance of new discoveries about it is small, but there is the back of the sheet to be looked at, the water-mark, and perhaps some parts that were obscure in the negative. The map was evidently folded to be sent to England in a letter, and I have always been in hopes that the accompanying letter may be hidden under a wrong entry in the manuscripts catalogue of the Museum.

That Harvard should have known Smith may not be probable, for Harvard was still a student at Cambridge when Smith died in 1631 and was buried in St. Sepulchre's in London; but his name had been for some time one of romantic interest, and there was some truth in the epitaph that was put above his grave, that the grim King had at last conquered one who in his time had conquered many kings. It is a pleasure to know that the dilapidation which has now rendered the inscription almost unreadable, is to be stayed at last, since the vestry of the church have within a few days voted to restore the monument.

JUSTIN WINSOR.

SOCIALISTIC TENDENCIES.

PARIS, January 21, 1891.

ALL the speeches from the throne, all the declarations of the Premiers of Europe, have been unanimous in declaring that the peace of the world has never been so well assured. Surely, the famous precept, "Si vis pacem, para bellum," has never been so well obeyed. If the love of peace may be measured by the degree of preparation for war, then we can really be said to love peace with a vengeance. The political world has been quiet during the last year, and political questions have been completely put in the shade by social and economical questions. So far, socialism has been chiefly a revolutionary and destructive force; there were, it is true, some schools of socialism which professed that society could be peacefully and systematically reorganized, and had elaborate plans for the happiness and the salvation of the world. These schools are nearly forgotten; few people care nowadays for the doctrines of Saint-Simon, of Fourier, of Considérant, etc. The modern Socialist is above all a revolutionist: he thinks less of building than he does of destroying. If a new society can be formed, let it be on the ruins of the old. Such are the instincts of the French Communist, of the men who fought during the Commune and tried to burn all Paris; of the Russian Nihilist, who sees no remedy for the evils of his country but assassination; of the Socialists who fought in Spain against the Republic as they would have fought against the monarchy.

Revolutionary socialism is a mysterious force, which endangers the political and social fabric of all countries. It has negative rather than positive doctrines; its army is formed of all those who think that they have been robbed of the natural inheritance of man. As long as Prince Bismarck was in power, he fought this revolutionary socialism with the determination and boldness which is in his character; he knew better than anybody how easily the German character absorbs ideas, how ready it is to generalize, and to what extremes it can carry a principle, whether right or wrong. Socialism had made, notwithstanding all the repressive laws, great progress among the German population, and its progress was not unconnected with the sufferings which are necessarily caused by the obligation of military service. Since the retirement of Prince Bismarck, we have been told to satiety that this retirement had no other cause than the temper of the Chancellor, his dictatorial habits, his impatience of opposition; but it is certainly not a little singular that his withdrawal coincided with the repeal of what are called the socialist laws. The Socialists can have now in Germany a party organization, committees, caucuses, newspapers, lecturers; they can agitate the country, collect money, encourage the strikes.

The young Emperor thought it expedient to adopt a course which Prince Bismarck would not adopt; he came forward with the boldness of youth and attempted to conciliate the Socialists instead of disarming them. You remember how he convoked a conference at Berlin, and asked the advice of the conference on some of the questions which are discussed eve-

ry day by the Socialists, and among others on the limitation of the hours of work. The conference, hastily summoned, composed of men who were strangers to each other, having no very definite object, and feeling that its decisions could have no sanction, was merely academical; it minimized its work, and left no real trace. But what remains, what is not forgotten, what has agitated the whole working class in Germany and in other countries, is the appearance, in the person of the Emperor of Germany, of a new sort of socialism, of State socialism.

Political economists have always struggled against the interference of the State in all private contracts, in all matters which are not strictly bound up with the preservation of the State. "Laissez faire, laissez passer," has been their motto. Political economy had its founders in a land of liberty, in England; it made converts in France, in Italy, in other countries, among the men devoted to the cause of civil and political liberty. State socialism is considered by political economists as one of the worst forms of oppression; but the pure doctrine of political economy is not just now in the ascendant—it is suffering a terrible eclipse. Democracy does not seem to be favorable to its axioms and principles; and the reason of it is obvious—universal suffrage brings to the surface, as representatives of the people, men who are condemned to represent local and provincial interests. Those interests are blind, they are jealous, they ignore the general and really national interests. The farmer of the Beauce wants his grain to be protected, unaware that France can import grain at Marseilles and export it at Havre or Dunkirk, and that the great current of traffic going from the Black Sea to the English coast, through the French territory, is a great source of wealth. The same may be said of every industry—of the wine trade, for example. It is a curious fact that the French Chamber, elected by universal suffrage, is becoming more widely protectionist every day. Well, protection is a form of State socialism, and it is not to be wondered at if State socialism gains where the spirit of protection does. In Germany the ground is well prepared; the State has since the war bought nearly all the important railways—all those which are called strategic; the State long ago organized the system of compulsory insurance—why should it not try to regulate the relations of labor and capital?

State socialism now confronts revolutionary socialism. Will the former destroy the latter, or will it simply favor its progress? State socialism aims to be one of the supports of the State, to work in the interests of the nation. The Emperor of Germany will certainly not abandon the principle of universal and compulsory military service, but here State socialism finds itself at issue with revolutionary socialism, for the chief character of the latter is internationalism. Herr Bebel does not speak of Alsace-Lorraine in the same way as the Emperor. The real socialists do not care for armies—they represent them as the tools of despots; they speak to each other across the frontiers. In the land of promise which they dream of, the Vosges, or the Rhine, or the Black Forest will not separate hereditary enemies. How can revolutionary socialism, which is international, be reconciled with State socialism, which is eminently national? It is difficult to imagine. So far State socialism, where it has been tried, has produced deplorable effects. The interference of the State with the management of railroads, for instance, has not produced the happiest results, It has produced an artificial state of things, which in the end has been detrimental even to the interests which it professed to defend. In the long run, liberty cures its own wounds; oppression never does.

We are threatened now with a third kind of socialism, with what might be called Christian socialism. The Catholic Congress of Saragossa distinctly asked for the intervention of the State in the relations of labor and capital. The Congress of Liége in Belgium formulated the same doctrines. In England we have heard them promulgated by Cardinal Manning. In France M. de Mun and a few others are the ardent promoters of this new sort of socialism. The Pope is engaged upon an encyclical on the subject of the social question; he has already written two by way of preparation for this encyclical, which, if I am well informed, will be more precise and doctrinal. Instructions were given some time ago to all the nuncios, and they have been furnishing the Pope with documents and statistics relating to the labor question. A confidential note of the Cardinal Secretary of State gave the nuncios an indication of the fundamental ideas which were to be contained in the forthcoming encyclical, with orders to sound the governments to which they are accredited on the probable effect which the encyclical might have. Naturally, the communications which the nuncios have made on this subject have not had an official, not even an officious, character. It would have been contrary to the traditions of the Holy See. The nuncios were merely to talk on the subject in a discreet manner.

It is obvious that the nuncios, having a diplomatic character, had in a measure their observations to make on the effect which the encyclical (or at least some of its passages) might have where they reside. It is said that, in the primitive text, the encyclical contained a rather warm eulogy of the Emperor of Germany, on account of the solicitude which he has shown, since he ascended the throne, for the welfare of the working classes, the Pope and the Emperor finding themselves this time in complete unison. But the special and perhaps too flattering mention of a sovereign to whom the Pope seemed to give a preponderating place among his brother sovereigns has, it seems, been considered as out of place in a document which will be addressed to the whole Catholic world. Catholicism is a universal religion as Socialism is a universal doctrine. All countries, whether they are democratic or not, seem to be imbued with vague aspirations and instinctive desires.

At the root of the present difficulties is the fact that the religious sentiments of the people are everywhere less acute than in former times. The contrasts between social classes are greater than in the past. The sense of resignation is gone, the spirit of discontent and revolt is becoming universal. The press acts like those resonators which magnify sound. Every day brings from all quarters of the globe some tale of misery, of horror, of cruelty; the many ideas which had not found a definite formula are becoming more distinct since they can be expressed in a word. The struggle for life is one of these terrible words which have rapidly won popularity. Mankind, as a whole, is probably neither more nor less happy than it was in ancient times; but it is more conscious. Religion found a divine solace for all sufferers, but it seems as if this solace had lost some of its power. Must the promise of a heavenly paradise be replaced by the promise of a terrestrial paradise? Christian socialism can no more change the earth into a paradise than State socialism or than revolutionary socialism. But it is surely a singular trait of the times that from such different quarters efforts should be made in the same direction; and it is painful to think that these efforts are all misdirected, and that the hopes held out to mankind can never be realized.

THE HOUSING OF THE POOR IN NAPLES.

LONDON, January, 1891.

"NEW Torments and New Tormented" is the title of an article in the *Nuova Antologia* by Pasquale Villari, Professor and now Senator—author of the life of Macchiavelli, of Savonarola, etc., but whose chief title to his well-earned reputation as an Italian citizen and patriot will ever be his 'Lettere Meridionali,' which, published in the *Opinione*, the organ of the then dominant Moderate party, called public attention to the vast untold, undreamed-of misery in Naples. At the time of its publication I was engaged in exploring underground Naples and persuaded by my friend to publish the results in a local paper, the *Pungolo* of Naples. Villari himself, with other friends, republished my letters in a small volume entitled 'La Miseria in Napoli' (Florence, 1877). As the motive of my researches was merely to collect facts and ideas as to the causes of prostitution, and to assist a well-known philanthropist in his inquiry into the causes of agricultural distress, I hesitated as to the publication, well knowing that for a British-born subject to talk of misery elsewhere would be to court the taunt, "Physician, heal thyself." But the Professor's pertinacity equals his modesty; he went to London two months after his visit to Naples, and wrote me a long letter, in which he described his visits to the worst quarters of London accompanied by a policeman in plain clothes, to the East End slums, to the low streets round the docks, always urging on his guide to take him to the "worst, the vilest, and most criminal quarters of London known to him." The policeman did this to the best of his ability, taking him into the worst huts and hovels and dens that he knew of, and also to some of the worst lodging-houses, where the beds are let at 1d. per night.

"Well," he wrote, "though I cannot affirm that I have seen the worst misery of London, I can say I have done my best to do so, and I can on my honor assure you that I am convinced that the poor of Naples are infinitely and beyond comparison worse off than the poor of London. If in London the poor die oftener of starvation than the poor of Naples, this is owing to the worse climate, not to their greater misery. If the climate of Naples was that of London, a far greater number would find peace in the tomb, ceasing from a life which is worse than death. . . . My judgments, being human, may err; but, I repeat, great, immense is the misery of the poor in London; yet I am persuaded that those who affirm that the poor of London are in worse conditions than those of Naples, either do not know the poor of London or the poor of Naples."

This letter, the fact that two home ministers supplied me with credentials to the Prefect and heads of police, of sanitary authorities, of prison directors, urging on them to assist me in seeing all and in examining accounts, etc., encouraged me to spend some six months in one year and three months four years later in underground Naples, in the galleys, the prisons, the so-called charitable institutions, in the hospitals, in the houses of the four classes of the then licensed prostitutes, and, accompanied by policemen and volunteers, in the worst lodging-houses and streets at night, in the fondacos and the grottoes. After each visit I wrote my experiences. None were challenged. One statement denied was after-

wards proved to be a fact. Many others, searchers and writers, put the results of these inquiries on record, the municipality began to bestir itself, then the members of Parliament; but until King Cholera asserted his despotism, it was not generally believed that Naples was really worse off than other large and densely populated cities. Are there any cities where thirty and forty families live in one underground natural grotto, whose only access is by a staircase hewn in the rock, where there is no well, no drain, no window, no ceiling save the rock, no pavement save the alternate rock and mud, where no partition divides one family from another, where all the operations of humanity from birth to death are carried on in public? we used to ask. "Well, no, perhaps not; but we don't believe that there are any in Naples, either." If the doubting Thomases were willing to come and see, they were convinced, and often joined the band of pleaders.

At last the municipality took a few of the worst places in hand, turned out the dense mass of human beings (who all, be it remembered, paid rent for their grottoes, or cellars, or doorways, or gutters), and, after spending huge sums for the right of expropriation, for demolishing, for compensation, they rebuilt some large blocks of houses, well lighted, well ventilated, well drained as far as drainage was possible in Naples. And the first time I returned, the then Mayor of Naples, a hearty, genial, benevolent man, invited me to visit the "grand new quarter." After viewing it, and inquiring the rent paid, I asked what had become of the "old inhabitants." "Oh! of those we know nothing," was the answer. "When we turned them out, we gave some of them a week's rent, and, of course, they found other lodgings." Some of them I tracked, and found that they had done so, but that their last state was worse than their first, because, not only were their places of residence worse, many of them being doomed to the nightly lodging-houses, but they had been obliged to remove so far from their work that they were reduced in many cases literally to starvation. The horrors that were revealed by the invasion of cholera stirred the hearts of the nation. Naples was to be *disembowelled*. The National Parliament voted fifty millions immediately, and promised other fifty—this in the year 1884–1885. Naples was to be supplied with pure water, was to be drained; the poor of Naples were to be housed in airy, decent dwellings. The city has been benefited decidedly by the introduction of the waters of the Serino (at an enormous cost, thanks to the system of contracts adopted), but pure, fresh water in Naples is a luxury and at the same time a necessity which cannot be too dearly paid for. The attempt to drain Naples is a far more difficult task, owing to the old system of sewers introduced by the Bourbons. The drains received at one and the same time the rain-water and all the contents of the cesspools; and as their inclination was insufficient the filth was not carried down and into the sea, but generally stagnated in the adjacent streets, filtering into the wells, and in reality causing the putrid fever for which Naples has been so maligned. It would be absurd to pretend that the accumulated errors of ages could be corrected in a few years. If only such attempts as have been made are honest, it is so much gained; but the dishonesty of contractors is so proverbial that, without a very sharp system of impartial inspection on the part of the Government and of the local authorities, very few Neapolitans would like to stake much on the results.

What a mere visitor to Naples can see at a glance is, that the city is being transformed: new public gardens, new, grand streets, new blocks of splendid buildings, have arisen as by magic. In some portions of the city the level of the soil has been raised. Not only the money voted by Government is being spent, but the province, the municipality, numerous societies, and, of course, the old house-owners are busily building and beautifying. In two single years the Società del Risanimento has demolished 88,261 square metres of houses; and when we remember that some of these consisted of five, eight, even eleven stories, we may calculate the displacement of human beings that has taken place. Prof. Villari puts the question:

"While we see new palaces, ample streets, elegant shops, splendid restaurants, and cafés-chantants, what has been done for the poor and for their habitations? No one imagines, I suppose, that the nation has made such great sacrifices for the wealthy classes, and for the embellishment of their city?"

In the next paragraph he answers it, and as he has been silent on the question for the last half-dozen years at least, satisfied to have set the movement going, hoping probably against hope that a beginning of the solution of the question of "misery" would be made, his answer, after personal reinspection, is terribly significant:

"This is the black spot. It will seem an exaggeration, but I am certain, as are the greater part of the Neapolitans with whom I have conversed, not only that the conditions of the poor have not been ameliorated, but that they have grown from bad to worse. One of the most arduous problems in all great cities has always been and is the housing of the poor. Never, so far as I know, has that problem been solved by private speculation. At Naples, especially, where space is so scanty, the ground so dear, the population so dense, the populace so poor, it is simply ridiculous to hope that private speculation could, on the very smallest scale, solve the problem. It is materially impossible to construct tolerable houses for the poor at prices which they can pay, and at the same time repay the builders. And where are there commercial societies that will build at a loss? What happens is well known. The poor do not enter the new buildings—they remain in their hovels; and when, as now happens, these hovels are demolished by the pickaxe, then the poor herd re-den (*rintanano*) in ever-increasing numbers in the hovels that remain, thus making their conditions worse; or many families crowd into one room in the new buildings, which become *fondaci*, often worse than those demolished, because, being dear, more people must be crowded into less space.

"The most elementary duty of humanity, the commonest prudence, therefore, ought to have convinced those who have studied the problem of the necessity of making a special contract with the Società del Risanimento for the housing of the poor, ceding a portion of the 100,000,000 of capital as dead loss, fixing the rent to be paid at lowest prices, and adding other favorable arrangements for the benefit of the poor. But whether it was owing to the haste, after such long waiting, or the vain hope that the Society, having gained so much on one side, would be willing to lose on the other, this proposition, which was made by one of the counsellors of the Neapolitan municipality (Parlati), was rejected. It was stipulated that houses for the poor should be built, but as a part of the speculation. Thus, the Society that assumed the works placed on one side the interests of the poor, on the other the interest of the capital employed in the works. If we add the gains of the contractors and the sub-contractors, the inevitable consequences will appear clear to all. The bad financial condition of the corporation is no excuse. When the nation voted its millions to ameliorate the hygienic conditions of Naples, it meant some of those millions to be used exclusively for the poor, for whose benefit the law was exclusively passed."

Villari then comments on the error committed in building a sort of workmen's quarter to house the plebs:

"Waiving the discussion as to the opportuneness, from a social point of view, of segregating the working classes from other classes of citizens, the system can only have a chance of success in cities which possess great factories and a real working-class population earning decent salaries. . . . But when you have to deal with the *maruzzaro*, the *carnacottaro*, the *pizzaiuolo* (shell-fish, cooked-meats, and cake-sellers); . . . with an infinite series of microscopic trades which don't deserve the name of industries; with a multitude which lives from hand to mouth, selling edibles, string, pitch, fishermen's nets, earning a halfpenny for some trifling service—the transferring all these poor creatures from the scene of their labors is simply to deprive them of the simplest possibility of existence. To say to the people of the districts of Mercato, Porto, Pendino, who precisely in those poorest quarters leave their children in some hole or other and ply their trades in the street in the open air, 'Go and live in another quarter,' is an irony, an insult to their misery. Yet it is for this population that a roof must be found; it is the problem of housing these people that had to be solved, and the solution of which is not commenced."

The Professor, whose residence as chief of the Superior Institute is at Florence, shows how the same problem presented itself in the City of Flowers when the old market was demolished. Then a society of benevolent persons was formed, $150,000 subscribed, and eighty houses for the poor completed, while other forty are being erected. The municipality of that city puts down $16,000 annually for the purpose, and I can add from personal knowledge that the assessors of the corporation always manage to find a room or rooms at the same price paid for the poor in the houses from which they have been ejected. And it is to public charity that Senator Villari appeals for housing the poor of Naples. He devotes the rest of this eloquent article to descriptions of the quarters personally inspected by himself, not omitting the maledictions invoked on the heads of the demolishers.

Hitherto such subjects as the sanitary conditions of Naples, the introduction of water, the exclusion of sewerage, this vital question of the housing of the poor, have been debated with all the bitterness and acrimony of party politics. It was not sought who would do the work best at the lowest price, but the friends of which political party should get the job. Again, the burden of the expenses ought to fall on the house-owners and the receivers of ground-rents; but it seems all the world over that this class of proprietors are more tenderly dealt with than any other class. Take the action of the London County Council, from which, fortunately, politics are excluded: the enormous scheme for the demolition of houses thickly built over fifteen acres of land in the Bethnal and Shoreditch District has been voted by the majority under the first part of the new bill for housing the poor, and the entire expense consequently falls upon the County Council, ultimately upon the rate-payers. The owners of the houses condemned and the receivers of the ground-rent, who have been for years untold and from generation to generation receiving rack-rents for many places quite unfit for human habitation, will be the real recipients of the sums voted. Had the Council instead seen fit to bring their scheme under the second part of the new act, the house-owners would have been compelled to repair, to pull down buildings run up in back-yards, and at their own expense render the dwellings fit for human habitation.

I visited the whole quarter with the kind, able, and thoroughly devoted head doctor of the County Council, and could not help exclaiming several times, "Ah, if you could only transport a few of these condemned houses to Naples!" Then he explained that the decision to bring the area under the first

part of the Act was arrived at owing to the enormous death-rate of the entire district. Of course, he said, we could force this and that landlord to do his duty, but the district is fouled, and there is no help but in total demolition. Any one comparing the housing of the poor in London to-day with even twenty years ago cannot fail to be astounded at the improvements. These are owing vastly if not mainly to the Peabody legacy, and now people are beginning to see that it does pay to build decent lodgings for the poor. I am surprised to find magnificent blocks of houses with one good room, with grate, large window, water, and use of closet with key, for three shillings a week; three rooms, all with fireplaces, cupboards, picture-rails, gas, water, sink, and closet on the landing, for seven shillings per week. Take, for instance, the Shaftsbury Park buildings: all these conveniences are to be had, with washing-houses, hot and cold water, and drying terraces on the roof. The inmates must obey certain regulations, one of which is that they may not underlet, may not take lodgers; thus overcrowding is avoided.

I do not, therefore, despair of Naples. The sad feature there is that wages are so low and employment so uncertain that it is useless to talk of any scheme that shall add one centime to the expenses. There, also, of charity organized by religious bodies there is none. I never once met a priest by the bedside of the sick or the dying save when summoned with the viaticum; you never see them in underground Naples. Nor do ladies, with rare exceptions, employ themselves among the poor. We may fain hope that the new law on charitable institutions may be brought to bear on their case, and, as there is no poor-law in Italy, appeals to individual charity ought to receive more response than they do. Prof. Villari will assuredly have awakened in many an answering chord, for no one can dispute his facts or accuse him of exaggeration or of "sensational" pictures. J. W. M.

Correspondence.

HOAR VS. HOAR.

To the Editor of The Nation:

Sir: In the *North American Review* of February, 1879, Senator Hoar has an article on "The Conduct of Business in Congress," which is excellent reading in the light of recent events. Speaking of the elevation of the Whigs to power in 1841, he says:

"Mr. Clay was leader of the Whig party in Congress. His lordly and imperious nature chafed under the incessant and vigorous attacks of his Democratic antagonists on the one hand, and the refusal of the executive branch of Government to submit to his dictation on the other. . . . In regard to every one of the great subjects of legislation, the Whigs attempted to exercise national powers which had never been used or had long lain dormant. The Democrats encountered every measure with the charge that it violated the Constitution, and that it was legislating for the rich against the poor."

After speaking of the limitation and closing of debate in the House, Senator Hoar proceeds as follows:

"As soon as the new rule had been adopted in the House, and the peaceable submission of the majority ascertained, Mr. Clay gave notice of his purpose to introduce it in the Senate. Fortunately for the Senate, fortunately for the country, he encountered a very different spirit from that which prevailed in the lower branch. . . . Mr. Clay flinched before this resolute resistance, and in a day or two abandoned his project. The Democratic leaders did not overrate the injurious consequences to public liberty of the suppression of debate and amendment at the will of the majority. The suppression of these in one branch of the National Legislature renders infinitely more important their preservation in the other. Mr. Clay and his associates seem to have been acting under the pressure of temporary exigency, and to have given little consideration to the grave and far-reaching consequences which their scheme involved. It is probable that the debate would have so fully exhibited the evil effects of the previous question on the Senate that Mr. Clay would have lost his slender majority before the vote; if not, the attitude taken by the Democratic party towards the rule would have assured its early repeal."

The Senator closes his article with the lament that "the House is losing its freedom of debate, of amendment, even of knowledge of what it is itself doing." Yet under the fear that the intelligence of the North has repudiated his party, he is willing to bring all the evils he has described on the Senate, and also override the constitutional rights of the States, in order to haul enough negroes from the swamps of Louisiana to bolster up the G. O. P. for another four years. The Senator's prophetic eye must have been looking forward to Reed when he wrote: "If we could in some way secure a Speaker who should be absolutely independent of party, it would be a great gain."

When Senator Hoar wrote the article in question, he evidently considered himself a statesman. But since he has assumed the rôle of a politician, he must be convinced that it is much better for the politician to follow the example of the "silent Senator" from Pennsylvania and never give expression to embarrassing truths. T. F. Hamblin.

Lewisburgh, Penna., January 31, 1891.

HONEST FARMERS, AND OTHERS.

To the Editor of The Nation:

Sir: Your correspondent, Mr. Jessup, as well as some other writers who, in one paper or another, have commented on my recent communication (No. 1333 of the *Nation*) on the subject of farm mortgages payable in gold, have apparently assumed that my letter was prompted by hostility to the farmers, and I have been served with a number of admonitions, like Mr. Jessup's, that the farmers are a very worthy class. Having myself been brought up on a farm, I should be the last person in the world to question such a conclusion. Nor, I submit, ought it to be considered an evidence of hostility that one calls their attention to the fact that they are making, or are liable to make, a bad bargain.

As to the moral aspect of a legislative scaling-down of obligations, no doubt many debtors are in favor of coining eighty cents' worth of silver into a dollar and paying their debts with it, who are not consciously dishonest. It is only by applying the legal rule that one is presumed to foresee the natural consequences of his own acts, that such people can be called dishonest. This may be a violent presumption to apply to the modern farmer—many things seem to indicate that it is; but when any one claims for the farmers an exceptional degree of honesty, I am forced, at least so far as regards public and official honesty, to differ from him. The claim that farmers are more honest than other classes of the community, and that if the Government were turned over to them we should have, at all events, honesty, even if we had some incompetency, is familiar, but it is cant.

As is well known, the Farmers' Alliance, at the recent election in Minnesota, secured a plurality of the Legislature, and, by a combination with the Democrats, is now in full control of both houses of the Legislature. Since they came into power the air has resounded with the noise of radical reforms and the introduction of "honest" methods of administration. "Corporate greed" was to be throttled, the "money power" was to be downed, and all the wicked devices of railroads, lawyers, and other knaves were to be checkmated at last. With regard to lawyers, it is a cardinal principle of the Alliance that no lawyer can enter the kingdom of heaven, much less an Alliance lodge. Now see how virtue fell! On the 2d inst., in the House of Representatives, there came up for consideration a bill to prohibit the acceptance of free passes or other gifts from railroads by members of the Legislature. This method of bribery has been in vogue from time immemorial in the Western States; but I never heard an intelligent man claim that the practice was anything less than virtual bribery. This bill was defeated in the House by a vote of 32 to 37. Of those voting, thirty-five were farmers, of whom nineteen voted for the bill and sixteen against. Of eight lawyers who voted, six were recorded for the bill and only two against.

Then a truce to this talk about the preëminent honesty of farmers. Farmers do not differ essentially in moral fibre from other classes of the community. Honest people are those who scorn bribes, be they farmers, merchants, or even lawyers. Howard L. Smith.

St. Paul, Minn., February 5, 1891.

EUROPEAN PEASANTRY AT THE WEST.

To the Editor of The Nation:

Sir: In the *Forum* for February there is an article in which Prof. Rodney Welch complains of a tendency of the farming population of some Western States, notably Illinois and Wisconsin, to sink to the level of a European peasantry. The Professor's observations are hardly in accordance with the facts. True it is that there are entire counties in these States which are settled almost exclusively by immigrants from Europe and their immediate descendants. But it is not true that these immigrants form a peasantry in the European sense. Any one who sees the peasant immigrants upon their arrival in this country and observes the same people ten years after they have settled on their new homesteads, will notice the difference. Furthermore, the regions to which Prof. Welch seems principally to refer were settled forty and more years ago. During that time these immigrants, being intelligent and mostly comparatively well educated, have acquired considerable knowledge of American institutions, and it is most emphatically untrue that they are citizens in nothing but name, as the Professor asserts. Although they use their mother tongue in their homes and churches, their children rapidly acquire a preference for the English language, and the old folks themselves are constant readers of the weekly editions of the great German papers published in the large cities. These papers are quite as good as the weekly editions of the English papers, and a man cannot read them for years without becoming pretty familiar with things American.

Prof. Welch complains of the tendency of farmers of New England antecedents to leave their farms, and takes it for granted that this tendency implies a deterioration of the condition of agriculture. The truth is, that the German who succeeds the New Englander is a much better farmer than the latter. When he acquires possession of the land, it is generally in poor condition, for the former owner cared

exclusively to get the largest immediate returns, but was unmindful of the danger of ruining the fertility of the soil. These worn-out lands are often restored to almost their former productiveness by the skill and industry of their new owners. It is true, the latter is a plain farmer and not a "country gentleman." But no more was his Yankee predecessor, whatever Prof. Welch may say to the contrary. The race of country-gentlemen never existed in appreciable numbers either in New England or in the Northwestern States.

It must be owned, also, that the German farmers do not send so many of their sons to college as their Yankee neighbors do. But this is not an unmixed evil, as it may be one of the causes why the tendency to move into the cities, while by no means absent, is not so large among Western farmers of German extraction as it is among those of New England parentage. ERNEST BRUNCKEN.

MILWAUKEE, WIS.

AN EARLY PORTRAIT BY HARDING.

TO THE EDITOR OF THE NATION:

SIR: Among the incidents of my childhood, so remote as to seem a figment of imagination, is one of having gone with my father to a studio in the little village of Edwardsville, Illinois, early in the third decade of this century, when Indians were my playmates, and buffaloes might have been seen any day on the streets, yoked with oxen, bringing the scant produce of the pioneer farmers to the "store" to barter for supplies. The studio—an unfurnished upper room in the town tavern—was Harding's, a biographical notice of whom appears in your number of the 22d inst. My father sat to him, and the portrait was sent to his sister in Kentucky. Some years afterwards my mother visited this sister with her little girl, two and a half years old, took her into the parlor and showed her several portraits of members of the family. When she came to this one of Harding's, the child exclaimed, "Why, that is my papa!"

I have studied *con amore* all of the public and many private galleries of Europe, from Seville to St. Petersburg, and I do not exaggerate when I say that for fidelity of expression and flesh tints—my father had a florid complexion—this piece of frontier work would not suffer by comparison with those of far more renowned artists. F. W. T.

LOS ANGELES, CAL., January 30, 1891.

Notes.

HARPER & BROTHERS have nearly ready 'Sir Robert Peel' in their series of biographies of Queen Victoria's prime ministers.

D. Appleton & Co. publish immediately a translation, by Mrs. Mary J. Serrano, of Valera's novel, 'Doña Luz.'

Fords, Howard & Hulbert will bring out the novel written in collaboration by George Cary Eggleston and Dofores Marbourg, entitled 'Juggernaut: A Veiled Record.'

A novel by Francis Howard Williams, 'Atman; The Documents in a Strange Case,' is in the press of Cassell & Co.

Worthington Co. announce for immediate publication 'Adventures on the Mosquito Shore,' by E. G. Squier. This is the sub-title of a work now some thirty-five years old, 'Waikna.'

Robert Clarke & Co., Cincinnati, have in press reprints of Withers's 'Chronicles of Border Warfare: A History of the Settlement by the Whites of Northwestern Virginia,' etc. (1831); Haywood's 'Civil and Political History of Tennessee,' from its settlement to the year 1796 (1823), and the same author's 'Natural and Aboriginal History of Tennessee' (1823). Also a new work, 'Beginnings of Literary Culture in the Ohio Valley,' by W. H. Venable.

An older work, Miss Edgeworth's 'Stories for Children,' has just been added to Bohn's Standard Library (New York: Scribner & Welford). The type and print are excellent and the price very moderate.

Macmillan & Co. begin the issue of the third edition of the invaluable Cambridge Shakespeare, edited by William Aldis Wright, in nine volumes octavo, with a beautifully printed page in large clear type, making this the most agreeable to the eye of any we have seen in the long series of editions of Shakspere. The edition aims only to fix the text, and is free from notes of any other sort than such as give the history of emendation and conjecture in the briefest form. It thus presents the textual labors of all editors in connection with a text of its own, unrivalled for sound judgment and thorough editorship. It will be issued in quarterly volumes, at the very moderate price of $3 each.

'A Dictionary of Idiomatic English Phrases,' by James Main Dixon (T. Nelson & Sons), owes its origin to the experience of its author as a teacher of English in Japan, and derives its character from that fact. The phrases are such as would be puzzling to a foreigner learning the language, but the greater part present no difficulty to a native. The author divides them into classes—good prose, conversational, familiar, and slang; and with his classification one might find much fault. By "familiar," he says, he means phrases "used in familiar conversation, but not admissible in polite society"; and under this head we find, for example, the Latin phrase "Cui bono"! What the author's standard of "polite society" is, one cannot very well determine, but it is certainly a strangely fastidious "society" that taboos such expressions as "to get one's sea-legs on," "a fish out of water," "fie," "dog-cheap," "in the dumps," "he will be the death of me," "to let the cat out of the bag," "to toe the mark," "Uncle Sam" (but "John Bull" is down as "good prose"), "Jack o'Lantern," and many other phrases almost as old as the language. Unless we are to talk without metaphors of the proverbial sort at all, and without short expressive phrases born with our tongues, it is hard to say how conversation is to go on by such standards in "polite society." The author's citations, we observe, are largely from the current works of his generation, and show no thorough acquaintance with historical English. The book seems to be of most value for the foreigner who desires explanation of idiomatic expressions, but can be of little service to those who have learned to speak English as a mother-tongue.

In 'Japan: A Sailor's Visit to the Island Empire' (New York: J. B. Alden), an American, Capt. M. B. Cook of Friendship, Maine, gives his impressions of a recent and evidently very enjoyable visit to constitutional Japan. The three chief cities and the two larger ports seem to have comprised his itinerary, so that little outside the familiar track of all travellers was seen. He has utilized his reading of American and other books on Japan, but in his didactic chapters is not especially interesting. More pleasurable are his impressions of the people and their outdoor life and amusements, and of the gentle charm of the native ladies whom he and his party met indoors as well as out. His picture of the promulgation of the Constitution in 1889 and the characteristic popular celebrations is very spirited. One cannot easily tire of a well-told trip to Kioto, and the Captain tells a good story of the pleasant people and things in the "Blossom Capital" and its neighborhood, rich in legend and historical association.

We have received four parts of an illustrated subscription work, 'The Picturesque Mediterranean, its Cities, Shores, and Islands' (Cassell Publishing Company). Well-known artists have in the main well executed the wood-engravings of the most salient features, a full-page illustration prefacing each subject; and equally well-known writers furnish the instructive and attractive descriptive text, which is interspersed with smaller cuts. Part first contains an adequate and not too long description of Gibraltar, together with Tarifa, Tangiers, Ceuta, and the Pillars of Hercules. Smyrna and Marseilles follow at greater length in the second and third parts, the descriptions being thoroughly in the spirit of those places. In the third and fourth parts Corsica, and a portion of the less well-known southern Syrian coast, with its great past, are pictured and well described. The article on Corsica agreeably and forcibly brings to mind the many fascinations of that island. One wonders why it is that this charming spot is not more favored by the large class of health and change-seekers always yearning for new fields within easy reach. There is here an abundance of grand scenery in mountains, valleys, and slopes looking on a lovely sea; a wild, luxuriant vegetation; fairly good roads; and an absence of those fashionable restrictions and excessive living rates common to the dusty resorts of the Riviera. There is also the freshness of rugged nature and a comparatively unchanged and picturesque people; and withal out-of-door possibilities dear to the roving Anglo-Saxon. Nor are good hotels lacking in the larger towns.

Mr. Herbert Ward's 'My Life with Stanley's Rear Guard' (Charles L. Webster & Co.) tells very simply the story of his connection with the Emin Pasha Relief Expedition. It consists mainly of extracts from his note-books, with here and there explanatory paragraphs. He adds nothing new to the sad history, as he was not in the camp at the time of the cannibal feast and Maj. Barttelot's murder. This officer's incompetency, however, is very conclusively shown, but of Mr. Jameson a very pleasant impression is given, as well as a pathetic account of his death. The closing pages are devoted to a reply to Mr. Stanley's personal charges. Some of these are shown to be unfounded, and the rest are met with an explicit denial. Incidentally Mr. Ward throws some rather unfavorable light on the affairs of the Congo Free State. He refers to the "appalling" number of deaths among the officers and European residents, and to a refusal to permit him to go on a steamer by the officer in command, who explained that as he should have hostile operations with the natives in several places, "witnesses would be undesirable."

Neilson's 'Trial by Combat' (Macmillan) is a volume of a kind unfortunately too uncommon in English literature — a painstaking monograph on an interesting subject in the development of social and legal institutions. It would have been better, perhaps, had the author limited his title to the judicial duel in Great Britain, for his introductory chapter on the origin of the wager of battle and its use on the European continent is necessarily but a condensed sketch of a matter admitting of almost unlimited development, and the body of the work is devoted to the vicissitudes of the legal duel in England and Scotland. In this

Mr. Neilson relies upon the original sources, and gives us the results of much research in MS. records as well as in the printed authorities. He has a keen eye for the picturesque incidents in which his theme abounds, his learning is wholly devoid of pedantry, and his style is lively, so that while the volume is a serious contribution to the history of British legal antiquities, it has ample attractions for the ordinary reader as well as for the historical student.

Dr. W. G. Harris's 'Spiritual Sense of Dante's Divina Commedia' (Appletons) is in the main a lecture delivered at the Concord School of Philosophy in 1886, and is conceived in the comprehensive-of-all-truth style which characterized the School's work in general. The patient and acute reader will find in it the moral and theological aspect of creation considered as a system of divine philosophy and grasped in its totality at once. As a commentary on Dante's poem it will appeal mainly to those who are more at home in commentaries than in poetry.

All that proceeds from the pen of Signore Pasquale Villari, the biographer of Savonarola and Machiavelli, is welcome, and we take pleasure in announcing the appearance of his volume of 'Saggi storici e critici' (Bologna, 1890), a collection of his occasional writings, reprinted mostly from the *Nuova Antologia* and *Rivisto Storico*. There are also two essays from the 'Encyclopædia Britannica,' one on Rimini and the Malatesta, and the other on the municipal government of Rome during the middle ages, which condenses in attractive shape an immense amount of curious research. To American readers the most interesting portion of the book is a disquisition on the institutions and society of the United States, based on the work of Prof. Bryce, with occasional reference to De Tocqueville. Of course on such a subject Professor Villari cannot speak from personal observation, but none the less noteworthy is the impression produced on a thoughtful Italian of the highest culture by the discussion of the numerous problems suggested by the development and present condition of our republic. It is needless to add that his views are fair and moderate, though he naturally sometimes fails to appreciate the causes which conduce to the buoyant hopefulness in the future so characteristic of our people.

In the pursuit of notoriety for his *Review of Reviews*, Mr. W. T. Stead has got out a cheap album, filled with process cuts, entitled 'Portraits and Autographs' (New York: Chas. E. Merrill & Co.). Mr. Stead's own portrait, a permanent photographic print, serves as frontispiece, and is the best of the collection. The medley is extreme. Balfour faces Parnell (or, rather, Parnell turns his back on Balfour), and the 136 embrace also Boulanger and Mme. Blavatsky, Gladstone and Salisbury, Huxley and Gen. Booth, Bradlaugh and Canon Liddon, Ignatieff and Henry George, Carmen Sylva and Philippa Fawcett, Mark Twain and John Burns, Josephine Butler and Marie Bashkirtseff, Goschen and Jules Verne, the Pope and John Morley, Henry M. Stanley and Henry Drummond, Zola and Tolstoi, Newman and Rubinstein, Queen Victoria and Frances Willard, Renan and Dr. O. W. Holmes, etc., etc. The group is as interesting as it is mixed, and is worth the enhanced American price (one dollar) against eighteen pence.

Mr. James Parton's 'Captains of Industry' (Boston: Houghton, Mifflin & Co.) is a "second series" of forty-eight brief biographies, mostly of Americans, from Gov. Edward Winslow, "the business-man of the Pilgrim fathers," to Amos A. Lawrence, "a solid man of Boston." A few women are enrolled among the "captains," as, for instance, Marguérite Boucicault, the head of the famous Bon Marché of Paris, and Mrs. Coston, the energetic widow of the inventor of the Coston night signals. The sketches are written in the easy, entertaining way which characterizes all Mr. Parton's work, the salient points of interest in the careers described being seized upon with unerring accuracy. The principal, though not the only, lesson taught is the value of industry as a means to success. Few of the "young Americans," however, for whom the author tells us the book is intended, can read it attentively without being impressed with the higher truth that there is a nobler use for money than the amassing it for one's own selfish gratification.

We had occasion recently to mention a valuable monograph on the railroad bridge over the Thames River by the chief engineer, Mr. Alfred P. Boller. His example has been followed by Mr. William R. Hutton, chief engineer of another notable structure, the Washington Bridge over the Harlem River. The handsome quarto volume bearing this title has been put on the market (Leo von Rosenberg, 35 Broadway). The photographic illustrations of the bridge at various stages are very numerous and exhaustive, and not a few are extremely beautiful. The details of construction are shown in a large array of mechanical drawings. The frontispiece shows the central pier, with its immense iron arches springing from either side, contrasting with the all-stone arches of the High Bridge aqueduct in the distance—a contrast of two ages of the builder's art, most interesting to all who travel up or down the shores of the Harlem River. The Washington Bridge was substantially completed in two years and a half.

Several mechanical works are on our table. A 'Text-Book of Mechanics' (D. Van Nostrand & Co.), by Prof. Thomas Wallace Wright, is in all respects worthy of commendation. Its chief merit, however, consists in the very full illustration of each special subject by a number of good and well-chosen examples. There is no other way to teach mechanics thoroughly. Mr. Harold Whiting's 'Short Course of Experiments in Physical Measurement,' Part II. (Cambridge), is one of a large class which have for their object instruction by experiments to be performed by the student himself. It is one of the best and perhaps the most original, much of the apparatus described having been devised by the author. In spite of its numerous competitors, the book deserves and cannot fail to receive a cordial reception. The part before us embraces only Sound, Dynamics, Magnetism, and Electricity. Mr. W. Cawthorne Unwin's 'Elements of Machine Design,' Part I. (Longmans, Green & Co.), forms one of the well-known "Text-Books of Science" series, and the volume before us is the eleventh edition of the work, which first appeared only in one part, but which is now to be extended to two and perhaps to a third. The scope of such a treatise is, of course, very wide. In the words of Reuleaux, the province of machine design is to show how the parts of the machine are to be proportioned so as to resist deformation. The opening chapter relates chiefly to materials; the others to the forms which these materials must take to subserve specific purposes. The remarkable popularity of the work attests its usefulness and excellence.

In the *Harvard Law Review* for January, Mr. John T. Hassam sets forth the advantages of the Australian System of Land Transfer. While it may be conceded that these advantages are considerable, it must be said that under our municipal governments or even State governments the examination of titles could not be wisely intrusted to public officers. Certainly no one would seriously contend that in the city of New York this extremely difficult and technical business should be turned over to Tammany Hall, and the government of none of our large cities is such as to invite this confidence. Much that the system aims at is now obtained through the title-guarantee companies, and their insurance policies afford ample security. From Mr. Hassam's account we do not see that anything would be gained over existing methods upon the devolution of title through descent, devise, or chancery proceedings, while it is an axiom that Government business is more expensively managed than that of private persons. Nor does Mr. Hassam explain what is to be done with our complicated system of liens upon real estate, which, however vexatious to the conveyancer, is yet apparently indispensable to the maintenance of the existing system of credit.

The *Scottish Geographical Magazine* for January contains a suggestive paper by Prof. Robert K. Douglas, the well-known Chinese scholar, on the commercial relations between Great Britain and China. After a sketch of the various steps by which foreign trade has been brought to its present condition, he shows how little has really been effected in changing the convictions and views of the Chinese as regards Europeans. The marked decline of British trade is then dwelt upon, the returns of the Imperial Maritime Customs showing that since 1866 "our direct trade has declined rather more than one-fourth, while the American trade has increased 40 per cent. and the value of the Continental trade has multiplied twelve times over. In other words, while in 1866 the value of the Continental trade was only one-thirtieth that of ours, last year [1889] it was more than one-half." It may be added here, that in the same time Continental trade, as compared with American, has increased from one-fourth as much to a volume nearly twice as great. This great increase, which has been mostly within the last four years, 1885–1889, Prof. Douglas ascribes mainly to the better commercial education of the Continental merchants and their clerks, especially in the various schools of Oriental languages subsidized by the Governments of Germany, France, Russia, and Austria, but not by that of Great Britain. He also calls attention to the trade springing up between Tonquin and Yunnan, probably the richest province in the Chinese Empire in mineral wealth, with a view to showing the absolute necessity of establishing a connection with Burmah if England is to reap any advantage from this desire for trade on the part of the Yunnanese.

The opening article in the last *Bulletin* of the Société de Géographie is upon the dispute between France and Brazil in respect to the boundary of French Guiana. This is, perhaps, the oldest diplomatic question yet unsettled, the first official negotiations in regard to it having taken place in 1700. France claims a strip of territory running from the ocean about six hundred miles to the Rio Branco, the larger part of which is the "Hinterland" of English and Dutch Guiana. If this claim should ever be established, it would make her possessions nearly four times as great as they now are, with an addition to her coast-line of two hundred and fifty miles, bringing her boundary nearly to the mouth of the Amazon. According to this article, the region in question consists mostly of prairie, well-fitted for European colonization, and with a climate

like that of Algeria. A glance at the accompanying map shows that the boundaries of the other European colonies in Guiana are equally unsettled, France and Holland contesting a considerable tract, while England claims territory from both Venezuela and Brazil. This is followed by an interesting account of Assini, one of the negro kingdoms of the Ivory Coast under French protection.

We have already described the special large-scale map of Western Asia Minor prepared by Dr. Heinrich Kiepert, and published in fifteen sheets by Dietrich Reimer, Berlin. The second instalment, consisting of Plates 3, 4, 5, 8, and 13, has just come to hand after a delay caused by the prospect of fresh data from Turkish sources, which in the end proved of no great significance. So far as these affect, however, the sheets already issued, Dr. Kiepert gives particulars which will enable any one to make the necessary corrections. The third and final instalment is promised by the end of April.

F. W. Christern sends us the first two issues (December 15, 1890, January 1, 1891) of a novel periodical possessing immediate interest and permanent value for reference. This is the *Revue Encyclopédique*, conducted by Georges Moreau (Paris: Librairie Larousse), and bearing the sub-title, "Recueil documentaire universel illustré." It professes to build on Larousse's 'Grand Dictionnaire,' furnishing a continuous supplement to that great work. In form it is a large quarto, the page in two broad columns, with a handsome variety of type, clear even when small. Illustrations are numerous and admirable. The arrangement is by departments—Music (by Arthur Pougin), Drama (H. Castets), Fine Arts (various hands), Book Reviews, with Law, Politics, Public Works, Medicine, Botany, History, Geography, etc., etc. The biographical sketches and portraits of men and women of the day are very noticeable. All this is ingeniously indexed in a four-page *Index-Journal*, which carries, besides, an independent assortment of current notes, news, and extracts, often articles of no mean length, in alphabetical order. One valuable feature of this *Index-Journal* is an explanation of neologisms, *e. g.*, *streptocoque* (a microbe), *lupus*, *folkloriste*, *Deakiste*, etc. The conception of this magazine seems to us to leave nothing to suggest.

A link between the past and the present has been broken by the death in London of Mrs. Drummond, widow of the famous Under-Secretary, Thomas Drummond, who fell a victim in 1840 to his labors on behalf of the people of the country he had adopted as his own. Mrs. Drummond was the ward of Conversation Sharp, the Miss Kinnaird of Wordsworth's letters to Rogers. She it was who copied out for her husband the letter to the Tipperary magistrates which drew down upon him the hatred of the upper classes in Ireland and the animadversions of the *Times*, because it contained the declaration that "property has its duties as well as its rights." She was a stanch Home-Ruler, particularly attached to John Dillon. Her house in Hyde Park Gardens was the resort of many and various friends who will sincerely mourn her loss.

At the Boston Museum of Fine Arts an exhibition of illustrated books, water-colors, sketches, engravings, etc., by William Blake is now in progress. It will close on March 15.

—Nearly eleven years have elapsed since we noticed the second edition of Maj.-Gen. George W. Cullum's standard work, the 'Biographical Register of the Officers and Graduates of the United States Military Academy.' It then ended with the graduating class of 1867. Meanwhile the author has attained and passed the great age of eighty, and has had the strength and courage, not only to revise his work and extend it to date, but to pass it through the press in a wholly new setting of the type—an ordeal which would appall a much younger man. The new edition fills three large octavo volumes, and issues from the press of Houghton, Mifflin & Co. Gen. Cullum has adhered to his resolution to end the military details of his sketches with the Rebellion, in the case of those who forsook the flag; but he allows place for the civil occupations of ex-Confederates since the close of the war. At the end of vol. iii. is to be found an account of the early history of the West Point Academy; and here, also, are given lists of battles and actions in which the graduates took part, in wars, foreign and domestic, including Indian engagements; a useful list of forts, arsenals, and military posts, past and present, with their location; and a table of civil occupations. In these peaceful pursuits farmers and planters lead (228), civil engineers come next (217); 185 followed the law, the civil service absorbed 170, 158 turned authors, the State militia borrowed 145 officers, 131 found employment as professors and teachers, 121 in mercantile life. It would be superfluous to praise this monument of industry and devotion to the author's Alma Mater. Another hand may continue the 'Register' hereafter, but no one will retraverse the ground so laboriously covered by Gen. Cullum.

—Mr. George Shea has printed a pamphlet with the title, 'Some Facts and Probabilities relating to the History of Johannes Scotus, surnamed Duns, and concerning the genuineness of the Spagnoletto Portrait belonging to the General Theological Seminary of the United States' (Cambridge: Riverside Press). Three other portraits of Duns Scotus, he says, are known, one at Windsor, one in the Bodleian, and one at Merton, and these are all admitted to be copies. The New York picture came from the shop of Mr. John Chaundy in Oxford; Mr. Chaundy had it from a gentleman who "understood that it had been brought into England from the south of France," and this gentleman's family believed it to be the original Spagnoletto. This, it must be confessed, is a somewhat indefinite pedigree. Mr. Shea adds that "the painting is recognized by connoisseurs as a genuine Ribera." Here is the gist of the question. The genuineness of the portrait can be decided on only by experts. We cannot rest on the opinion of unknown "connoisseurs"; if some acknowledged Spagnoletto authority should examine the picture, his decision would carry weight, but for the present, it will be generally felt, opinion must be reserved. The figure of Scotus, as represented in the photograph, is striking, and it will be pleasant if it should prove to be an original Ribera. The sketch of the great schoolman's life in the pamphlet is not carefully done. The author says, for example (p. 17): "So rapid was his advance that in his first year at the University [of Paris] he was appointed Regent of its Theological School." But the title "regent" belonged to any Master of Arts who chose to teach; and though there was a theological "Faculty," and the Sorbonne was in existence in 1304 (when Duns went to Paris), it is doubtful whether there was "a Theological School," for colleges had already been established, and in all of them theological instruction was given. The statement (p. 15) that "upon a vacancy occurring by the removal to Paris of his master, William Varron (A. D. 1301), Scotus was appointed to the chair of Philosophy," has too modern a tone. There was then, properly speaking, no "chair of philosophy" at Merton College; any master might lecture on any or all of the subjects of the curriculum (in which the philosophy of the time was, of course, prominent), and had to trust to his ability to attract pupils. A similar looseness of expression occurs in Mr. W. J. Townsend's 'Great Schoolmen of the Middle Ages.' Why so much space should be given to Erigena, who had nothing to do with Duns, is not clear. Mr. Shea has, however, done well to call attention to the portrait, and it is to be hoped that the authorities of the Union Theological Seminary will submit it to a competent expert who may enlighten us on the question of its genuineness.

—The three articles by Prof. E. P. Morris on the Sentence-Question in Plautus and Terence, which appeared originally in the *American Journal of Philology*, have now been reprinted in a single pamphlet of 116 pages. It forms a most valuable contribution to our knowledge of a syntactical subject that has never before received the attention which it deserved. The mere collection of the 3,000 questions occurring in these two authors would have been in itself a work deserving of the highest gratitude. But they are further arranged and discussed under separate headings, according to their nature as well as to the interrogative particle which introduces them, and, when this has been done, the history of the interrogative sentence, from its earliest stages, is thoughtfully considered. The whole work is done in a most scholarly fashion, and the author richly deserves, and will doubtless receive, the thanks of all students of the classical languages. Writers of new Latin grammars and revisers of old ones will find many things of interest to them in these pages, and will in future have facts and not theories upon which to base the rules which they lay down. To such, Prof. Morris's views upon the particle *an* are especially commended.

—"Nullumst iam dictum, quod non sit dictum prius," says Terence; and this truth may be brought home to any Englishman who wou'd take credit to himself for inventing the term "Disunited States," uttered in the darkest days of the Rebellion. If, on the other hand, he wishes to shift the responsibility, he can do so by alleging a quotation. The name is at least a hundred and six years old; it occurs in the *Annual Register* for 1785 (London: Robinsons), under the heading "Principal Occurrences," p. 52. We read, in July:

"On the 24th inst. Dr. Franklin embarked at Havre, and on the same day landed at Southampton; whence, after taking some refreshment, he embarked for the isle of Wight, where a vessel lay ready to convey him to America. It is said, his presence is there much wanted, to heal the dissentions that universally prevail throughout the disunited states. The singularity of his course has, however, given rise to much speculation."

—No Queen since Mary Stuart, whom she closely resembles, has been so worshipped by blind admirers as the unfortunate sister of George III., Caroline Mathilde. Historians, novelists, and poets have united to assert her innocence and to condemn the heartless cruelty of her enemies. It is refreshing, therefore, to read in the latest work on this subject, C. Blangstrup's 'Christian VII. og Caroline Mathilde,' a cool, impartial, and critical account of this sad episode in Danish history. The author, who has already published several historical sketches of considerable value, has carefully prepared himself for the present task

by consulting all authorities, printed and unprinted, within his reach, many of the latter of which were only recently made accessible. After an admirable sketch of court life in Europe in the middle of the eighteenth century, Blangstrup proceeds to give a painfully minute account of Christian's childhood and youth, under the severe training of the brutal Reventlow. We here find the clue to his later disgraceful and unhappy life. Separated by indifference and etiquette from his parents' care, and treated with a harshness and lack of sympathy that seem almost impossible, the boy's natural intelligence was almost entirely destroyed, while his fondness for unseemly indulgence was rapidly developed by his miserable companions. The efforts of his tutor, the excellent but weak Reverdil, were of but slight avail in counteracting the temptations surrounding the young prince. The combination of heredity and environment was too strong to be overcome. The account of Caroline Mathilde is the chief source of interest in the book to all but Danish readers, and perhaps even this exception need not be made. Here the author is weakest as regards the early life of the English Princess. A fuller inquiry into Caroline's antecedents and English contemporaries would certainly have aided much in explaining her character. The description of her career after her arrival in Denmark is, on the other hand, as detailed and graphic as the materials would permit.

—Of the Queen's guilt, Blangstrup expresses not the slightest doubt. He even attributes the parentage of the little princess to Struensee. But, while concealing nothing, he brings out clearly all the extenuating circumstances connected with the event. The first of these was the utter indifference of the King, which was more than returned. Christian, who was thoroughly imbued with the spirit of the times with respect to matrimony, frequently declared that he regarded marital fidelity as quite foolish and plebeian. Even when the intimacy between the Minister and his Queen could no longer be disregarded, his theory remained unchanged. The Danish court, furthermore, belonged at that time to the most corrupt and licentious in Europe, and it was quite impossible for the young Queen, with her lively disposition and frivolous temper, to remain unaffected by her daily surroundings. Both by her own frequent expressions and by the cowardly confession of Struensee, she had for several years regarded the latter with feelings warmer than she had ever entertained for her husband. The romantic view of her life is the result partly of the Queen's personal charms and unhappy fate, partly of the unpopularity of her opponents. Romance aside, however, no one will deny the truth of Blangstrup's remark that "her name is among those that cannot be mentioned in Denmark without rousing sad thoughts."

MAGELLAN.

Ferdinand Magellan. By F. H. H. Guillemard. [The World's Great Explorers.] London: Geo. Philip & Son. 1890. 8vo, pp. 356.

FERNÃO DE MAGALHÃES, son of Pedro de Magalhães of Sabrosa, was born in the year 1480, on a day not now discoverable. His family was noble and of the oldest in the kingdom of Portugal. Little is known of his immediate family or early youth, but it has been found that he was made a page of the Queen-Dowager Leonor, widow of Dom João II. In his fifteenth year he became a servitor of the King, Dom Manoel, a monarch eminent for the services he rendered to the maritime interests of Portugal, indefatigable in promoting discovery and navigation, and in spreading Portuguese influence in the Orient. Expeditions towards this end were constantly being fitted out, and in 1504 Fernão applied for leave of absence, bade adieu to court life, and enlisted as a volunteer in the great armada of Don Francisco d'Almeida, at that time preparing to sail for India.

Almeida's fleet was the largest that had hitherto set out for that promised land. Circumstances had shown that the time had come for the appointment of a resident official who should hold the reins of government with a strong hand. To Almeida, as first viceroy of India, fell the task, herculean in difficulty, of organizing and ruling countries and peoples as yet almost unknown to their conquerors; and nobly he fulfilled it. His name, overshadowed by the greater glory claimed for his successor, Albuquerque, is unfamiliar to many of us, but few if any have left the East with cleaner hands and a record more unsullied. Associated with "many gallant men and cavaliers experienced in war," Magellan could not well have begun his Indian experiences under better auspices or with better comrades.

The expedition sailed in March, 1505, and, after various adventures, arrived off the bar of Quiloa, on the coast of Mozambique. Here they were badly received, and without loss of time the city was carried by storm, a fort erected and garrisoned, and in August, 1505, the fleet started for Mombaza, somewhat further north. Here was one of the most important trade centres of the African coast, strongly fortified, and garrisoned by ten thousand Arabs. After severe fighting, this place also was taken, but so politic were the conquerors that victors and vanquished soon became firm friends. Thence the fleet sailed for Archediva near Goa, where it arrived in September, and, after reducing the obstinate rulers of several adjacent provinces, part of the ships were loaded with pepper and spices and despatched to Lisbon, where they arrived May 23, 1506. On the voyage the hitherto unknown eastern coast of Madagascar was discovered.

The Moorish Powers determined to take advantage of the weaker state in which the withdrawal of the fleet had left the Viceroy, and resolved to equip a great armada which should attempt the conquest of the very stronghold and seat of government of their enemies. This plot was revealed to the Portuguese by an Italian traveller, Ludovico Vartema, who escaped from Calicut. The naval battle that ensued, off the Malabar coast, was one of the most celebrated fought by the Portuguese in India, and resulted in the overwhelming defeat of the assailants, who lost more than 3,600 men, against seventy or eighty Portuguese killed and two hundred wounded. Among the latter was Magellan. On his recovery he was sent to Sofala, leaving the Viceroy apparently well established in his power after the crushing defeat inflicted on the Orientals. On his return affairs were changed. The Sultan of Egypt had joined forces with the adversary to defend his Eastern commerce threatened by the Portuguese establishment. A naval force under Dom Lourenço, the son of Almeida, had been defeated, and the wounded commander sank with his shattered vessel, after desperate resistance. In December, 1508, Albuquerque arrived to succeed Almeida, but the latter declined to give up his command until he had avenged himself. Magellan is supposed to have been with him on the *Holy Ghost*, commanded by Nuño vaz Pereira. The fleet of nineteen ships descended upon Dabul and destroyed it so completely as to give rise to a Moorish proverb, "May the vengeance of the Franks overtake you, as it overtook Dabul." Next at Diu the Portuguese encountered a force of more than a hundred sail, which, after desperate fighting, was defeated with the loss of three or four thousand men. This dear-bought victory cost many killed, and again among the wounded was found Magellan. But the power of the Portuguese in India was fairly and indisputably established.

In August, 1509, Magellan sailed with Diego Lopez de Sequeira for Malacca, where the ship arrived in September, and by the carelessness of the commander the whole expedition was nearly betrayed to their ruin. Magellan's courage and presence of mind did much to retrieve the disaster. By the rescue of Francisco Serrão, he established a bond of friendship which at a later time rendered possible the great voyage of circumnavigation that has made his name immortal. Into the Indian service of Magellan, romantic and successful as it was, including the capture of Malacca, the discovery and conquest of the Spice Islands, it is impossible to go further at this time. But we may note that the establishment of Serrão at Ternate, and the information of richer countries beyond sent by him to Magellan, formed, it may be safely conjectured, no slight inducement to that voyage which proved the final undertaking of this illustrious navigator, and upon which his reputation in these days is chiefly founded.

About 1512 Magellan had returned to his native land, where he remained for nearly a year, officially a member of the King's household, but not necessarily resident in it. It was the custom that the gentlemen of this connection should receive a stipend, which, though merely nominal in value, served as an index to their rank and position. Osorio tells us that "each person was esteemed the more noble according to the amount of salary that he received." In July, 1512, Magellan was promoted, receiving a stipend of 1,200 milreis, equivalent to about three dollars and a half a day, in the modern value of the coins, but having a much greater value in those days. In 1513 he formed one of an expedition against the Moors of Morocco, where he was so wounded in the leg by a lance as to remain ever after somewhat lame. A year later he became involved in difficulties which resulted in loss of the royal favor and the refusal of desired advancement. The situation was such that it was evident that, so far as his king and country were concerned, his career was over. He was unemployed, and likely to remain so.

Barros has recorded that, shortly after this time, Magellan wrote to Serrão in the Moluccas to tell him that he would be with him soon, "if not by way of Portugal, then by way of Spain." There can be no doubt that for a long time, possibly ever since his Malaccan experiences, the project of reaching the Spice Islands by the western route had been impressed upon his mind. That it was this project which he laid before Dom Manoel is almost certain. All we know is, that his plans met with a cold refusal. At seven and thirty, a born leader of men, of varied Oriental experience, a master of the art of navigation, his mind filled with his project, he found himself condemned to a life of obscurity and inaction. To a man of Magellan's character and training but one course lay open, and that course he took. Bidding adieu for ever to Portugal, he publicly denaturalized himself, and, passing into Spain, entered the service of the Emperor Charles V. This action drew

down upon him a perfect storm of abuse and invective, the more unjust because such was common usage at the time; Columbus, Cabot, and Vespucci being three of many instances.

Hardly a quarter of a century before, King João II. had regarded Columbus as a boasting and ridiculous adventurer. Now Magellan learned from his successor that "he might do as he pleased." The discovery of the New World and the circumnavigation of the globe are the two greatest achievements of geographic history, but Portugal, which had both within her grasp, cannot claim the glory of either. Magellan could scarcely have met with kinder or more influential protectors than those who welcomed him to Seville. Here he married, in 1517, Beatriz Barbosa, the daughter of his friend and host. Passing over the long series of preliminary struggles, it may be said, in brief, that on the 23d of February, 1518, an agreement was signed which bound the navigator to the service of the Emperor on the projected vogage. It is to be noted that Magellan has become Spanish even to his signature. Fernão de Magalhães has ceased to exist, and we make acquaintance for the first time with Fernando Magallanes.

In spite of Portuguese intrigues, promises, and threats, and a thousand other difficulties, on the 20th of September, 1519, the little fleet cleared the river and set forth on its memorable voyage. For an account of the first circumnavigation the reader must be referred to Dr. Guillemard's scholarly and readable volume. It must suffice to state here that on the 21st of October, 1520, Magellan discovered the strait which bears his name. In defiance of hunger, scurvy, mutiny, and losses by treason and stress of navigation, he pressed onward across the broad Pacific, and, on the 6th of March, 1521, sighted the Ladrones Islands. On the 18th the first of the Philippines was discovered. On the 27th of April, at Mactan, near Sebu, Magellan lost his life in a conflict with the natives, brought on by too great confidence in his own unaided judgment. His son died in September, 1521, and in March of the succeeding year the wife Beatriz followed him. Though the navigator bears a reputation for untarnished honor, and was charged with no act of cruelty in an age of cruelties, his memory was execrated in his native land as that of a traitor. His wife's connections, after the death of her father, were deprived by the Spanish crown of the heritage which would naturally have come to them, and cried, from the depths of poverty, for justice, but in vain. Such was the gratitude of princes.

The book is well printed, and illustrated with a wealth of engravings and maps of such a quality as is only too rare. Giving as it does not only a picture of the navigator, but a delineation of the little world in which he moved, it will be welcome alike to the student of history and the lover of adventure.

RECENT FICTION.

Two Loyal Lovers. A Romance. By Elizabeth Winthrop Johnson. F. A. Stokes Co.

Her Great Ambition. By Anne Richardson Earle. Boston: Roberts Brothers.

Gilbert Elgar's Son. By Harriet Riddle Davis. G. P. Putnam's Sons.

With Fire and Sword. By Henryk Sienkiewicz. Translated from the Polish by Jeremiah Curtin. Boston: Little, Brown & Co.

Ekkehard. By Joseph Victor von Scheffel. Gottsberger & Co.

THE historical romance 'Two Loyal Lovers' serves no true purpose. It has too bitter a flavor for entertainment; and while the incidents and characters are doubtless true to life as it existed in the South more than a quarter of a century ago, the recalling of them in this form, merely for remembrance, is hardly an excuse for being. History and biography afford more fitting memorials. In a note at the end of the volume the author claims that these records are "too precious to be put aside under any lazy pretences of 'forgetting and forgiving.'" But as the labor of reconstruction is an existing and a necessary one, in which North and South must join, it may be well to bear in mind an old proverb, "The mill will never grind with the water that is past."

One would naturally expect, from the title 'Her Great Ambition,' to be introduced to a heroine possessing rather more than the average woman's force of character. Disappointed in this, we turn to meet the other *dramatis personæ*, whose action may have thwarted the heroine's ambition—that of becoming a great artist; but with one exception, and that not a notable one, they are flimsy creations. The whole thing lacks color, not only in the portrayal of the characters, but in the geographical outlines, which have an exasperating vagueness; like the conventional drop-curtain in a provincial theatre, the mountains, valleys, and streams might belong to almost any quarter of the globe. The author seems to be trying to revive the fast-dying sentiment that a woman with an ambition for art in any form must necessarily lose her power for personal affection; but with a heroine whose inherent weakness of character is the principal cause of her failure, and who does not even know whether she tried to end her troubles by drowning, or accidentally fell into the river, the only resource left is to marry her off as speedily as possible and say nothing more about her great ambition.

A quotation from "Twelfth Night" on the title-page,

> "I am all the daughters of my father's house,
> And all the brothers too,"

gives the keynote of 'Gilbert Elgar's Son,' for Robin Elgar was the daughter of a Maryland farmer who, fond of fox-hunting and good-comradeship, had allowed his once fine estate to fall into decay. His lament for a son who would restore "Airlie" to its former flourishing condition kindles in the susceptible heart of the girl an intense desire to take the place of the brother who had died before her birth. This desire, in a nature like Robin's, henceforward shapes her action; and she takes a relative called "Cousin" Dick by courtesy, living on an adjoining estate, as her ideal. She rebels against the little country school, and by good fortune falls into the hands of a man of original ideas, from whom she receives a training usually given only to boys. Sharing her father's outdoor pursuits, she becomes an exceptionally expert horsewoman, and, with superb health of mind and body, is well-equipped when the necessity arises, through the death of her father, to take a son's place beside her invalid mother. There was need for all Robin's well-trained energies, and with sound judgment she lays out her course, and toils unremittingly side by side with her men, sowing, reaping, harvesting. Meanwhile Cousin Dick, who has been abroad for many years absorbed in scientific pursuits, learns, through a chance meeting with a recent visitor at his old home, of the situation of his kinswomen, and, acting upon a chivalrous impulse, returns to pay off the debts and take the helm. But his offer of pecuniary aid meets with a sturdy refusal, and in despair he offers himself, to be indignantly rejected.

The story abounds in pleasant pictures of country life in the part of Maryland settled by the Friends. The description of a gathering of the neighborhood "Horticultural" at Airlie is interesting. The young hostess, as womanly as the gentlest of dove-colored Friends, is unexpectedly called upon to "say something" in place of an absent essayist, and gives modestly and naturally her own blank-verse translation of the Georgics; while her hard-won success as a farmer is warmly commented on by the farmers present. One wishes that the author had omitted the well-worn arguments on taxation without representation, introduced towards the end of the book. The story of such a woman as Robin Elgar, with powers so well trained to carry out a heroic purpose, does not need to be bulwarked by argument.

'With Fire and Sword,' by "the first of Polish novelists," has already, we are told, won a wide popularity in Europe. Mr. Curtin's able and spirited translation is now before the public, and has assuredly done for the work whatever is to be done towards fairly presenting it to American readers. The novel deals with an exciting episode in Polish history, the dreadful rising in 1648 of the Cossacks, under Hmelnitski, against the Commonwealth of Poland, Lithuania, and parts of Russia. The Cossacks joined forces with the Tartars, and the allies carried desolation into Poland in a series of fearful battles, of which that of Berestechko, which terminates the present book, though a victory for the Poles, caused "the victors themselves to be terrified at their work." This period of the rebellion, lasting over four years, constitutes the first act of the long drama created by Hmelnitski, which, after victories and defeats, culminated in the downfall of the Commonwealth.

The campaigns of the terrible Hmelnitski and the no less terrible Prince Yeremi Vishnyevetski of the Commonwealth form the subject of Sienkiewicz's romance. A beautiful princess, many times taken prisoner and as many times freed by knightly rescuers, furnishes the needful *ewig Weibliche*. Around the figures of the two commanders, which gleam luridly from the canvas, stands a group of wonderfully well-defined knights and warriors. Most prominent of all, Zagloba—sot and braggart, "an evil tongue but a golden heart," befriended by the Fates, his every act of cowardice turned into seeming heroism, whining at danger, but facing it for love of friend and country; swearing, swilling, toasting, whimpering, but ever accomplishing; wit and bully, a Falstaff for greed and swagger, a Prospero for tender care of the beautiful Helena—is a creation of which any author might be proud, and from whom, notwithstanding the gruesome places through which one has accompanied him, one parts with affection and regret. The deeds of these knights in the bloody adventures of war and the equally bloody adventures of rescue fill in the historical outlines. A score of minor characters are painted with fidelity and skill, each one bristling with the rude and vigorous life of the time.

It would be unreasonable to expect a pastoral to be made out of a story of revolt among a half-civilized mob in the seventeenth century; but we frankly confess that to us the book seems unnecessarily loaded with horrors. If history did impale its war-victims on stakes, at least the author might have spared us the sight. Fire and sword are in fact domestic pets beside the atrocities with which every page reeks. We shall also, at the risk of ap-

pearing weakly Anglo-Saxon, venture to remark that 776 pages of closely printed octavo devoted to battles, to the drinking of "gorailka," and to adventures compared with which those of 'The Cloister and the Hearth' are kindergarten tales, smack of overplus, and are at times distinctly tedious. Yet many an eye will moisten for brave Podbipienta; and in hinting at the possibility of a tear on the eight-hundredth page of an historical romance we consider that we have borne eloquent testimony to the power of this author.

'Ekkehard,' long dear to the German heart, and read throughout the length and breadth of Germany, wherever a library, or a fireside, or a school-room abides, has found its way to our shores in an excellent translation, put into two convenient little volumes—a well-advised sop to the Cerberus of American incapacity to endure the long, the large, the much. If we cannot quite feel that it is worthy to be the national novel of a great people, the classic which it is almost a blasphemy to have translated, it must certainly be said that it ranks as an agreeable story—or collection of episodes strung with skill and taste upon a thread of history—and that we have a pictorial presentment of the tenth century, with figures alive with tone and energy. Cowled monks talking in Latin, writing pompous manuscripts and guzzling sour wine; cloister pupils making double-rhymed hexameters; merry goose-maidens; Hunnish warriors and ladies fair, make up the personages in a pretty drama that shows to "the very age and body" of this time "the form and pressure" of that. The warm, human heart of the tenth century is brought very close to that of the nineteenth; its virtues and faults are not widely different, though the former are practised on simpler, narrower, straighter lines; and the latter ride rough-shod and spare not. The author has happily "amalgamated heaven and hell," which Carlyle reprehends, but which is essential to a true picture of life in any century. The saints sin, the sinners play the hero. These are real human beings, leading real lives, for all their musty learning and barbarous customs. Nor has the poet, in becoming an historian and an analyst of human motive, forgotten to be a poet. The fair light of fancy plays upon his pages, now and then flashing into a veritable moment of poetry. If we say that we think Waltari's great epic poem might better have been postponed to a separate volume, we are only saying that fiction may well illustrate the literary history of a century, but should hardly be the text-book. If we say that there are several climaxes in the closing pages, and that the story dies hard, we are only saying that a sense of climax is not part of the German birthright. If we say that it is amusing to compare with Sienkiewicz's 'Fire and Sword,' in its utter absorption in the subject, the personal note which sounds—both through Von Scheffel's preface, and later, when he takes leave of his "dear reader," alluding to the headaches of composition—we add directly that a poet who did not pipe a personal note would be as unpleasant an anomaly as a new-fashioned grandmother.

Studies in Literature. By John Morley. Macmillan & Co.

THIS final volume of Mr. Morley's miscellanies adds the uncollected pieces of a literary character not included in the works issued some time ago. The subjects are partly special, such as reviews of Victor Hugo's 'Ninety-three' and Browning's 'The Ring and the Book'; partly of a general nature, such as the lecture on "Aphorisms" and on "The Study of Literature." Some of these papers have been already commented upon in these columns, but few of them stand out among the author's writings with any relief. The most striking by far is the keen, destructive criticism of Sir Henry Maine's 'Popular Government,' in which Mr. Morley expresses the danger even so acute a generalizer runs when he separates himself from the concrete conditions of politics. The burden of the criticism lies in its illustrations of the extent to which ideas, without a basis in fact, may lead to errors in the conception of what democracy as a political system is, and what are its historical sources and practical supports. For Sir Henry Maine's statements as well as for his theoretic views Mr. Morley shows what can only be called a polite contempt. A more interesting paper in its personal relations is that on "French Models," in which the author quotes the characterization of himself by a political opponent as "The Saint-Just of our Revolution," and proceeds to defend himself from the charge (not confined to this ludicrous instance) of following after "French Models." The whole is more piquant reading than usually is the case with him, but its more useful part consists in his discussion of the relation of history to politics, of ideas to reform in the doing, and in general of the scholar's equipment to the public man's necessities.

The correspondence of Mr. Macvey Napier gives him opportunity to make some remarks of a helpful nature on the duties and trials of an editor as he himself found them; and the concluding paper is his "Valedictory" on leaving the *Fortnightly*, in which also he found occasion to speak his mind about editorial problems, and in particular about signed and unsigned articles and the advance in the open discussion of public questions. Upon the former point he writes with his usual moderation, and shows the advantages and disadvantages incident to both anonymity and publicity. We will not refrain from quoting what he says upon a matter recently mooted among ourselves:

"The old talk of 'literary bravoes,' 'men in masks,' 'anonymous assassins,' and so forth, is out of date. Longer experience has only confirmed the present writer's opinion, expressed here from the very beginning: 'Every body who knows the composition of any respectable journal in London, knows very well that the articles which those of our own way of thinking dislike most intensely, are written by men whom to call bravoes in any sense whatever would be simply monstrous.'"

The passage goes on admirably for a page, and we recommend it as a just expression of what an editor who on the whole inclines to signed articles in magazines (allowance being made for exceptional cases), thinks may be urged against reviewers. As a whole, the volume is more profitable for political than literary thought, but the love of letters and a wide acquaintance with them are diffused through all the essays, and the even style is admirably adapted to the sound matter, neither having any real brilliancy.

The Conflicts of Capital and Labor. By George Howell, M.P. Macmillan. 1890.

THE rate of modern progress is strikingly illustrated by this book. When the first edition was published, in 1878, trade unions, as Mr. Howell says, "were denounced in the press, on the platform, in the pulpit, and in Parliament; not occasionally, but constantly, persistently, and virulently." Now they are regarded with favor or with indifference; at all events, without apprehension. Society has other bugbears wherewith to terrify itself today, and is, perhaps, even beginning to look on the trade unions as bulwarks of conservatism. Nor is this without good reason, for there are manifest indications that the communistic and socialistic elements find certain features in the present constitution of these bodies very much in the way of their revolutionary plans. The fact is, that the great unions have passed out of the militant stage, and have become to a great extent mutual-insurance companies, and as such have become possessed of large funds. They are thus in position to carry on war if necessary, but at the same time they have strong inducements to remain at peace.

The strength of these inducements appears from an examination of the balance sheets of the principal trade unions. In the year 1876 seventeen of these bodies, with a membership of 212,000, had an income of £384,000, and expended £338,000, having a surplus of £616,000. In 1889 sixteen unions, corresponding to a great extent with the seventeen previously referred to, and with but slightly increased membership, received £530,000, spent £378,000, and had a surplus of £556,000. Mr. Howell estimates the total number of workmen combined in trade unions at not less than 1,500,000, their annual income at £2,000,000, and their accumulated surplus at the same figure. This surplus, however, is maintained in a shape available for immediate use, being kept on deposit in the joint-stock and savings banks. It is obvious that such funds as these, while of great service for insurance against ordinary vicissitudes, would soon disappear in a general industrial war.

If we examine the history of the most prominent of the unions, the Amalgamated Society of Engineers, the progress of peaceful aims becomes more apparent. Taking the twenty years, 1869-89, we find that the number of members has risen from 33,000 to 60,000, the income from £82,000 to £183,000, the expenditure for sick benefit from £17,000 to £30,000, the superannuation allowance from £8,000 to £40,000, the accident benefit from £1,600 to £2,177, the funeral payments from £5,600 to £8,289. The donations to men out of work happen to be in 1869 nearly £60,000 and in 1889 only half that sum, but this item varies irregularly, and we can only say that it tends perhaps on the whole to decrease. It seems, therefore, that this society finds itself in the position of other life-insurance societies of long standing, obliged to provide for increased numbers of maturing claims. The regularity of its receipts is of increasing importance to its success, and it is obvious that a strike will not be hastily entered upon by men who see that their insurance may be imperilled by such action. Mr. Howell calls attention to a common and very serious misunderstanding of the meaning of "donations to men out of work," or "the out-of-work fund." This benefit is distinct from pay to men on strike, and has amounted in the case of the Amalgamated Engineers to the enormous total of £1,500,000 during the last thirty-nine years. It may be added, as of possible interest to the holders of policies in American life-insurance companies, that the total expense of this society for rent and salaries of officers is about £350 a year.

Although the temper of society has changed, Mr. Howell's book retains the acrimonious tone that was excusable, if not altogether justifiable, when the first edition appeared. He would have greatly improved it had he omitted the imprecatory passages, and especially had he refrained from his futile onslaught upon political economy. Of that science he knows little,

and he allows himself to be infuriated by the hostile screeds of its false prophets. It is not so very certain that political economy has a message to be delivered to the trade unions, but if it has, it will confine it to their effect upon the production of wealth. We are not aware of the existence of any conclusive evidence upon this point; nor is it a simple matter to prove that these unions have altered the distribution of wealth. They may have increased the wages of some laborers at the expense of others; they may have in some places increased wages at the expense of rent; but that they have increased the wages of laborers as a class is at least unproved. What they have done that will be generally admitted to be laudable is to insure their members against some of the more grievous ills of poverty, the miseries, prospective and actual, of failure of work, of health, and of life, when there is none to help and nothing to alleviate. They have enabled laborers to secure the fair competitive value of their work in cases where the pressure of immediate necessity would have put them at a disadvantage in bargaining with their employers.

In spite of the intensity of Mr. Howell's feeling, we are impressed not only with his honesty of purpose, but with the general fairness and soundness of his views. We cannot admit the validity of his plea for those unionists who refuse to teach apprentices, on the ground that they would raise up competitors by so doing. It is the old fallacy that the introduction of machinery lessens the work to be done—a fallacy which Mr. Howell as a rule avoids. Nor can we agree with him as to the need of long apprenticeships. Adam Smith exploded this idea long since, and the increased intelligence of workmen renders it wholly inadmissible. But in most other respects we believe that Mr. Howell's views will commend themselves to all dispassionate readers, and his book will be accepted as the leading authority upon the subject of which it treats. We must except from this latter statement the introductory portion, which is devoted to the history of the earlier guilds—a subject requiring a broader scholarship than that of this author.

As to the matter of State aid, Mr. Howell's tone is thoroughly manly. All that he asks for workmen is liberty of combination for the purpose of securing for themselves the best terms that are economically possible. The idea of establishing a universal working day of eight hours by act of Parliament he repudiates with scorn, and so, it may be added, do those other leaders of the workmen who have done most for them in the past. Mr. Howell's book was published before the recent action of the Congress of Trade Unions, but he was evidently aware of the tendency to call in the aid of Government that has temporarily, at least, prevailed, and impressively predicts the evil results that will follow from it. Should this tendency continue, the unions will presently be involved in conflicts with one another, and the individual unions will suffer from dissension among their own members. Their history has been an interesting and not altogether inglorious one, and Mr. Howell has done well to preserve its details; but it may be doubted whether he would be grateful for the wish that he might be spared to carry the story far into the future. He has seen the rise of the trade unions, and has promoted it. It would be sad should it fall to him to chronicle their decline.

New York in the War of the Rebellion. By Frederick Phisterer. Albany: Weed, Parsons & Co.

THE statistical statements upon which Col. Phisterer has been engaged for many years have now appeared in this bulky volume. The author is already well known by his volume of 'Statistical Records' in the Scribner series of Campaigns of the Civil War, but the present work, although confined to the record of the State of New York, is much more elaborate. It gives the lists of members of the successive Legislatures from 1861 to 1865, and the war legislation passed by them; the cost to the State in lives and money; a list of all officers who died; a list of over two thousand engagements in which New York troops participated, and, for the important actions, a statement of each New York organization present, and the number of killed, wounded, and missing, and, finally, a brief history of each regiment and battery, with a list of the engagements in which it was present, and its losses in each. Much of the information which it contains is to be found in publications of the Federal Government, but it does not appear that anything is here repeated except what is necessary to make a complete record for the State of New York. On the other hand, there are some important omissions. For instance, a complete list is given of all general and staff officers and officers of the regular Army, Navy, and Marine Corps—all officers, in short, who were appointed by the President; but no names are given of regimental officers except the first commander. The reason alleged for this omission is that these names were printed in the report of the Adjutant-General of New York for 1867. But this is a document not easily accessible, and it is certainly more important to know the names of the commanding officers of regiments at successive periods of the war than to know the names of additional paymasters, boatswains, and sailmakers appointed by the President. In Whitelaw Reid's 'Ohio in the Civil War,' the names of all regimental officers are given as part of the regimental histories, and but very little additional space is required for them. What also seems to us a serious defect in a work of this kind is the lack of any general index. In the 'Records of the War of the Rebellion,' published by the War Department, an elaborate index accompanies each volume, and all students who have had occasion to consult these volumes know how invaluable the index is, and how nearly useless the work would be without it.

Notwithstanding these defects, Col. Phisterer's book will always remain the standard source of all statistical information relating to the part taken by the State of New York in the Civil War. It is a most honorable part, and it is well that it should, once and for all, be placed on record. New York furnished one-sixth of the Northern armies, and contributed one-eighth of the death-roll. With a population of less than 4,000,000 in 1860, and 764,000 males between the ages of eighteen and forty-five, this State sent to the war 400,000 individuals, of whom, in round numbers, 8,000 served in the militia, 16,000 in the Regular Army, 46,000 in the Navy and Marine Corps, 4,000 in the United States Colored Troops, and 15,000 in the United States Volunteers, leaving 311,000 in the State Volunteers. Of these latter, 48,066 died, about 13,000 of them killed outright, 7,000 from wounds, and 28,000 from sickness. Another 48,000 were wounded but recovered. The cost to the State in money, exclusive of amounts refunded by the Federal Government, was $160,000,000.

From such a mass of statistics many conclusions of much interest to the military reader can be drawn, but space enables us to mention only one or two of them. The figures just quoted show that, in war, sickness is more to be feared than the enemy. Among the 311,000 individuals there were killed in battle 4.17 per cent.; died of wounds, 2.32 per cent.; died of disease, 8.96 per cent. The total deaths were 15.45 per cent., and the percentage of those who were wounded but recovered was 15.62 per cent., making a total of 31.07 per cent., or nearly one man in every three, either killed, wounded, or died of disease.

We next observe that the men were well led, for the proportion killed in action and died of wounds was slightly greater among officers than among the men, the proportion for officers being 7.10 per cent. and for enlisted men 6.45 per cent.; but on the other hand the officer fared better in sickness than the enlisted man, for the proportion of deaths from disease was, among officers, 2.33 per cent., and among enlisted men 9 34 per cent.

The relative danger of service in the three arms is shown by the fact that while the proportion of deaths from disease was nearly the same in all three, yet in battle or from wounds the cavalry lost 3.13 per cent.; the artillery, 4.09 per cent.; the infantry, 6.89 per cent.—thus proving once more the well-known principle that the infantry bears the brunt of the battle. But if the cavalry does not lose heavily, it is seldom away from the enemy, and only for brief intervals does it cease skirmishing with him. For instance, the First New York Cavalry in forty-four months of constant service met the enemy in no less than 224 encounters, exclusive of picket duties, and passed only seven months without an engagement of some sort. There were 1,910 individuals in the regiment, and of these only 46 were killed or died of wounds, 122 died of disease or other causes, and 111 were wounded, but recovered. Seven-eighths of the regiment were uninjured. Their fellow-soldiers in the One Hundred and Twenty-first Infantry, in a service of equal duration, had a very different experience. This regiment participated in only 30 engagements large and small, but among them were Fredericksburg, Marye's Heights, Gettysburg, the Wilderness, Spotsylvania, Cold Harbor, Petersburg, Cedar Creek, and Appomattox. It numbered 1,380 members from first to last, and of these 226 were killed or died of wounds, 120 died of disease or other causes, and 454 more were wounded, but recovered. Only two-fifths escaped unhurt. The losses of this regiment were exceptional, but there were several others in which one man of every two was either killed, wounded, or died of disease.

Dressage méthodique du cheval de selle d'après les derniers renseignements de F. Baucher, recueillis par un de ses élèves. Paris: J. Rothschild. 1891. 8vo, pp. viii, 198.

To those to whom the name of Baucher suggests only the thought of the "High School," this volume may be something of a surprise, dealing as it does mainly with the way of training a horse so that he shall be "easy and pleasant to ride and regular in his gaits." It is true that directions are given for producing the fancy gaits which are the stock in trade of the average trainer, but we are expressly told that all these are entirely unnecessary. The author, concealing his titles of General and Baron under what no doubt seems to him worthy of greater respect—"one of the pupils" of the master whom he followed even in his last days, after the terrible accident which put an end for ever to his practical training of the animal that he so thoroughly understood—gives us in the title of the book one of the most striking characteristics of that master when he says that the notes from which the

volume is formed are "after the last teachings" of Baucher. For though, or rather because, Baucher was so good a teacher, he was always a learner, and a learner from the animal that was his pupil. He was an original thinker, and in this book we have not only directions for doing certain things, but a real philosophy of training which, let it be said in passing, would apply as well to the training of a child as to that of a horse. The author could in no other way have borne so strong a testimony to the nature of the animal to whose study he had given so much time. Witness these statements: "Whenever we have succeeded in making one position very familiar to the horse, it is always at the expense of the facility with which he takes others." "Give the *position* which ought to produce the movement desired. Do not seek first the movement, which ought to be a consequence of the position." "Do not urge him; give the position and let the horse act for himself." "The horse understands at once the difference between your laying down the reins on his neck and your holding them by the ends. . . ." Again and again he impresses it upon his student to secure obedience by simply making it impossible for the horse to disobey. He warns him in the first stages of the education to be content with the smallest appearance of obedience, and to reward at once, and give rest for a while. The first lesson is to secure lightness of the mouth, but as soon as we feel that the jaw relaxes never so little, we are to yield our pressure. The effect of the steady eye of the trainer is insisted on. There is nothing finer or really more philosophical than this: "After each smallest punishment given, the rider, calm and entirely devoid of anger, is to *study what is going on in the mind of the horse.*" Again: "After each different movement has been obtained, let the animal rest for several minutes, if it be necessary, until the preceding movement no longer *resounds in his organism.*" As the training proceeds, "we must try to *feel* if he is *about to take* a false position." And he tells us that, after all, the means for obtaining any desired gait comes rather from the acquired instinct—if one may be allowed the expression—of the horseman than from any theory. No Englishman could ever have said this. It seems necessary to give these quotations in order to communicate the spirit of this most admirable book.

The author begins with definitions of the technical terms which his master was in the habit of using, and then goes on to the great principles which generated his whole practice. Briefly stated they are these: "Dominate in order to teach. Teach by rendering wrong action impossible. Then give back the horse to himself." How to do these things is set forth in the pages which follow, by means of all the beautiful accuracy of the French language, so that any one who rides may read: "Go very slowly if you wish to secure rapid progress." "Let him believe that he is his own master; that is the way to make him our slave." "Constant repetition and avoidance of irritation are the keys to success." How Baucher studied the smallest detail and its effect upon his pupil is seen in the way in which he speaks of the whip as "dispersing the forces" which it is the necessity of the rider to collect. It is only when the forces of the horse concentrate against the will of the rider that the whip is to come into play at all, and then instantly, sharply, and only once. The lashing of the tail, like a fault in a child, is to be turned to account to produce just the motion that is required. To transmute that wasted energy into a good forward movement is the art of the master. "All sudden action breeds uncertainty in the gait."

It is difficult to criticise this book because of its very fulness. It is overrunning with suggestions of the most valuable kind. The very phrases are picturesque, and seem to be alive; as, for instance, where we read of "imprisoning the horse between bit and spurs so as to render him, at the very first, incapable of resistance to our will." Baucher's great theory, that hands and legs must never be used together, is shown to be no cast-iron rule, for both at the beginning and at the end of the training it is allowable. The casual observer who supposes that every horse is at least symmetrical in his own action, will find room for some new ideas in relation to individual peculiarities also, and may thereafter produce perhaps better results in his amateur efforts, and may be led to take the blame on himself, and not to charge it to the horse, when he finds himself unable to secure a desired result.

In this work we have no carelessly thrown-together collection of suggestions, but a complete system of training in which every part subserves every other, and no stone is laid without being the intended foundation for some other division of the structure. When we add that the book is a pleasure to read because of its beautiful paper and typography, and that the tiny illustrations which close every chapter are simply delightful and of endless variety, we complete the praise which it deserves both as to matter and method. An excellent table of contents facilitates reference to any subject, even to the smallest details. For the benefit of those who do not read French with ease, it were much to be desired that we should have at the hands of some first-class workman a complete translation of the book; and with the present growing interest in riding, it would seem as if this would be, from the point of view of the publisher, no uncertain venture.

Le Ordalie: Studio di Storia del Diritto e Scienza del Diritto Comparato, da Federigo Patetta. Turin: Fratelli Bocca. 1890.

In the history of the evolution of the social organization and of the development of law, there are few subjects more interesting and instructive than the system of judgments of God—the judicial ordeals by which men have sought to determine disputed questions by referring them to the decision of the supernatural powers. In almost innumerable forms, and in almost all stages of civilization, save the very lowest and the highest, human reason has thus sought to release itself from responsibility and to relieve itself from doubt. It is seen to-day in the customs of many savage tribes, it is traced back to the most ancient records of the civilized races, its disappearance from European codes is a matter of but a few centuries, and every now and then some startling occurrence shows that it still lingers in popular superstition.

The activity of modern investigation has within a few years accumulated an immense mass of new material for the history of the custom. Researches into the primitive Oriental religions, the publication of mediæval documents, the reports of scientific explorations in the little known parts of the earth, have all contributed innumerable scattered facts; and Signore Patetta has done a service of no little magnitude to the student in assembling these facts with unwearied industry, and in coördinating and elucidating them in the true scientific spirit. Based as far as possible on the original sources, many of them still in MS., his work is a storehouse of knowledge, intelligently arranged and clearly set forth, and it is indispensable to the student of human institutions and development. The only fault we have to find with it is the absence of an analytical index, which would so greatly facilitate reference to the immense mass of information contained in its pages. No care in the systematic arrangement of the text supersedes the advantage to the hurried scholar of such a key to the treasury.

Recherches sur les Tremblements de terre. Par Jules Girard, Secrétaire-adjoint de la Société de Géographie. Paris: E. Leroux. 1890. 8vo, pp. 198.

It is somewhat difficult to conceive for what class of readers this work is intended. Its title—'Researches,' etc.—would indicate that the author was addressing an audience of scientific men to whom he wished to communicate some original investigations of his own. The book, however, contains no original investigations or observations by the author, and the accounts given of the original work of others are never full and are frequently inexact. Neither is the book quite suited to a popular audience, for a considerable space is devoted to minute details relating to the construction of seismographs (earthquake-recorders) which can have but little general interest.

The ten chapters of the volume treat of a great variety of subjects, from the traditions of the ancients regarding earthquakes to the destruction of buildings and to the dependence of shocks upon the situation of the planets in their orbits. The book is too small to allow this variety of topics to be adequately treated, and the necessary conciseness takes away much of the popular interest, while at the same time scientific precision has not been attained. For English-speaking readers the work of Milne ('Earthquakes and Volcanoes,' International Scientific Series, volume lv.), is much to be preferred, though M. Girard's volume may fill a place in France.

There is still room for a popular treatise on earthquakes and earthquake phenomena. The accounts of eyewitnesses of the great catastrophes are often most graphic, and exhibit human nature under strange conditions. The whole history of an earthquake country is well worth reciting. The scientific side of the matter, too, can be made as interesting as it is important. The problems to be considered relate to the proper registration of the circumstances of a particular earthquake, and also to the proper discussion of the statistics of earthquake phenomena within the limits of a region, a country, or a hemisphere. A suitable treatise would bring out and emphasize the fact that in both these matters there is a sharp line of demarcation between the old and the new. The invention of instruments really suited to the accurate registration of earthquakes was only made about a dozen years ago (by the European scientists in Japan and especially by Prof. Ewing). The examination of earthquake statistics in a scientific fashion was begun by Mallet and Perrey less than fifty years ago, and the methods are not yet in a satisfactory shape.

The difference between the old and new science of earthquakes—between the problem as treated by Humboldt in his 'Cosmos' and by Ewing in his various works—is of capital importance. It should be particularly emphasized in any popular treatise. In the book of M. Girard it seems to have been overlooked.

Anne Bradstreet and Her Time. By Helen Campbell. Boston: D. Lothrop Co.

THE materials for a biography of Anne Bradstreet bear no proportion to the works which she left, and these latter are not of the sort out of which clever writers construct imaginary autobiographies. The author of this not brief life of the colonial poetess has been forced into using histories and records of the settlement in Massachusetts, and of the conditions, political and literary, of the mother-country, in order to make a book extraordinarily diffuse and miscellaneous even for such work as this. All that is known of "the grandmother of American poetry" or of her relatives is told, but besides this we have a view of the times in England and of the men and events of the Puritan colony, and, in fact, of whatever would serve to make a chapter; and as little of it is fresh, and there is no vivacity or effective handling in the rearrangement of the old material, the volume does not lighten the natural dulness that weighs on the subject by itself, and of which the reader is treated to a most liberal supply in the shape of long extracts from the "poems." The best part consists of the pages of Anne Bradstreet's prose meditations which she wrote out for her son, in which one discovers force of mind and a degree of literary faculty. Mrs. Campbell intimates that one reason of her writing this biography was to explain why it was that this country has not produced intellectual women of equal mark to the best of England; but we do not see that she succeeds at all in this, and it is difficult to find exactly where she has applied her mind to it.

The volume would have gained by a less ambitious treatment, by which its matter should have been restricted to the subject of it, and to such illustration of the poetical works that won the esteem of the early clergy as might be deemed readable by a patient man; as it is, there is much more verse than can be relished except by an antiquarian. It is perhaps impossible to depict the character of this striking woman with any real success, but it was not merciful to afflict a memory, already sufficiently burdened with dulness in its own right, with the added weight of a dull biography.

BOOKS OF THE WEEK.

Allen, G. The Great Taboo. Harper & Bros. 40 cents.
Bourget, P. Was It Love? Worthington Co.
Brown, D. W. The American Patent System. 25 cents.

BACK NUMBERS, VOLUMES, OR sets of leading and scarce magazines, etc., for sale by H. WILLIAMS, 195 West 10th St., N. Y.

The Founding of the German Empire.

VOLUME II.

Based chiefly on Prussian State Documents. By HEINRICH VON SYBEL. Translated by Marshall Livingston Perrin, assisted by Gamaliel Bradford, jr. Vol. II., 634 pages, with portrait of Bismarck. 8vo, gilt top, $2.00; half morocco, $3.00. To be completed in five volumes.

A more absorbing history has never been written. The first volume has met with universal approval. The second volume, herewith presented, carries the narration from the dramatic negotiations of Count Brandenburg in 1850 down to the Assembly of Princes at Frankfort in 1863, covering a period of the most vivid and vital interest. These events were a preparation for the still more stirring times when Germany was to measure her forces with Austria and France, and change the face of the continent in a way more permanent than was ever dreamed of by Napoleon the Great. With the prospect of these coming events the remaining three volumes, which not only keep up but also enhance the interest, will be awaited with keen expectation. They will be issued at an early date.

T. Y. CROWELL & CO.,

NEW BOOKS THAT SHOULD BE READ.

The New Senior at Andover.

By HERBERT D. WARD. 12mo. Illustrated. $1.25.

The 'New Senior at Andover' is a realistic story of life at that famous old Phillips Academy at Andover ("the American Rugby"), in which persons and places are drawn with a master hand, and the trials and experiences of boarding-school life are made the centre of continued and dramatic action, spiced with humor and touched with pathos.

Anne Bradstreet and Her Time.

By HELEN CAMPBELL. 12mo, $1.50.

A charming biographical sketch and study of the earliest of America's female writers, "the grandmother of American literature." Anne Bradstreet's descendants number some of America's most distinguished men of letters—the Danas, the Channings, the Buckminsters, Oliver Wendell Holmes, Wendell Phillips, and others of lesser note. Mrs. Campbell has told her story with all the vigor and interest that could be expected from so earnest a writer, making for the reader of to-day a very real and vital person of that old-time champion of woman's possibilities, Mistress Anne Bradstreet of Andover.

The Story of Kentucky. By

EMMA M. CONNELLY. 12mo. Illustrated. $1.50.

The latest volume in the "Story of the States" series is full of vivid interest. Kentucky is one of the most picturesque and dramatic States of the Union, and the talented author of 'Tilting at Windmills' has done justice to its peculiar and romantic history in her brilliant and vigorous story.

The Story of Wisconsin. By

REUBEN G. THWAITES. 12mo. Illustrated. $1.50.

The development of this rich Northwestern Commonwealth, the growth of its industries, its exciting political complications, its noble record in the war, and its late rapid advance are all sketched with vigor by Mr. Thwaites, whose position as Secretary of the State Historical Society has given him ample facilities.

Helps in Teaching Reading. By

MARTHA S. HUSSEY. 12mo, 75 cents.

An almost invaluable book not only for teachers, but for all interested in producing that rare excellence, good, clear, intelligent reading by young people. It has the highest testimonials from head-masters, teachers, and supervisors, who have seen the sheets.

Gid Granger. By W. O. STODDARD.

12mo, $1.25.

This popular boys' writer never fails to magnetize any subject he undertakes. His present story consists of vivid pictures of life on a farm, the sturdy, hard-working boy, the ambitious sister, the faithful father and mother, and the different village folks, all strongly individualized, and will be found delightful reading for young and old.

The Still Hour. By AUSTIN PHELPS,

D.D., LL.D. Cloth, 60 cents; gilt edges, $1.00.

For thirty years this little book on prayer has had a steady and enormous sale. The last work done by the late Professor Phelps was the correction of the proofs of the new edition, to which he had added a new chapter on "Faith" and a new preface.

A New Edition of a Most Charming Book.

Warlock O' Glenwarlock. By

GEORGE MACDONALD. Illustrated by George Foster Barnes. 12mo, 714 pages, $1.50.

"The Laird of Warlock is one most noble and most tender."—*Independent, N. Y.*

LATER BOOKS BY SAME AUTHOR.

What's Mine's Mine. 12mo. Illustrated. $1.50.

To read this book of his is like wandering over the hills and moors of the Scottish Highlands, to breathe the strong, invigorating atmosphere of the mountains.

Weighed and Waiting. 12mo.

Illustrated. $1.50.

Hester Reymount, the Heroine, is a fine study for any woman who thinks to marry a man and reform him afterwards.

Donal Grant. 12mo. Illustrated.

$1.50.

The book is a powerful stimulant to a fearless search after truth.

At the Bookstores, or sent, postpaid, by the Publishers,

The Nation.

NEW YORK, THURSDAY, FEBRUARY 19, 1891.

The Week.

We comment elsewhere on the letter by which Mr. Cleveland has given another signal illustration of his courage. It is brief, but it covers the whole ground, and it defines his position even the more clearly and emphatically for its brevity. After stating his inability to attend the meeting of the Reform Club, the writer says:

"I am glad that the business interests of New York are at last to be heard on the subject. It surely cannot be necessary for me to make a formal expression of my agreement with those who believe that the greatest perils would be invited by the adoption of the scheme embraced in the measure now pending in Congress for an unlimited coinage of silver at our mints. If we have developed an unexpected capacity for the assimilation of a largely increased volume of the currency, and even if we have demonstrated the usefulness of such an increase, these conditions fall far short of insuring us against disaster if, in the present situation, we enter upon the dangerous and reckless experiment of free, unlimited, and independent silver coinage."

This letter continues to be the chief subject of public interest and comment. The silverites have actually quailed before it. They must not be allowed to rally. Advantage should be taken of the opportunity now presented to drive them to the wall, just as the greenbackers were driven when Gen. Grant vetoed the Inflation Bill. A vigorous campaign for sound money should be started at once, having for its object not merely the prevention of free coinage, but the repeal of the present Silver Law, which law will lead to the silver standard in time just as effectually as free coinage itself. The popular education that suffices for the one will suffice for the other also. The present law is simply a drain on the taxpayers for the benefit of silver-mine owners and speculators. If it does not lead to the silver standard, it is sheer waste. If it does lead to that result, it is a great calamity. As long as it hangs over the business community we shall have distrust, stringency, and hard times. Moreover (and this is a result that has not been sufficiently considered), it piles up in one place a mountain of silver that has got to be disposed of some time. The higher this mountain becomes, the worse will be the landslide eventually—the worse for silver-mine owners and silver-using countries in every quarter of the globe.

The comments which the St. Louis *Republic* is reported by telegraph to have made upon Mr. Cleveland's letter are so remarkable, coming from a newspaper with an established reputation for intelligence, as to suggest the fear that the editor was suffering from temporary aberration of mind when he wrote them. After saying that the letter is "merely the private opinion of a single Democrat," and that it is probable that the "whole matter may be settled by free coinage before 1892," the *Republic* adds:

"But if it is otherwise, the entire matter should be left to the Democratic National Convention. On its adoption of a platform of tariff reform and free coinage, it will be Mr. Cleveland's duty to accept both the nomination and the platform if the party demands his leadership. Certainly if such a demand were made on him and he did accept the nomination, he would be above the suspicion of disloyalty. He would waive his own personal opinion, and stand as sturdily for the party on the minor issue as he has stood on its leading issue of tariff reform."

The attitude of Mr. Cleveland, standing on a platform which advocated a financial policy that he had previously denounced as "reckless and dangerous," and saying that since his party wished it he would consent to look upon it as a "minor issue," and waive it, would be anything but "sturdy." Horace Greeley used to "spit upon the platform" and support its candidate, and he himself, a furious protectionist, tried to run for the Presidency on a tariff-reform platform by referring the tariff for settlement to the Congressional districts; but in none of these "double acts" was he very successful. What the *Republic* proposes for Mr. Cleveland is far more absurd than anything Mr. Greeley ever attempted.

The *Commercial Bulletin* pays its respects to those "friends of silver" who are now proposing a new compromise. It is wonderful how many compromises these people can turn out in a single year. They now talk of a bill for free coinage of American silver only, including in this term silver produced from foreign ores treated in American smelters. The *Bulletin* shows that there is no means of determining what is American silver, since the Mexican border is a great unprotected line, sparsely settled, stretching from ocean to ocean, "and crossed by multitudes of roads, while even on the chief railroads inspection of every package coming in could hardly be so close as to exclude all silver. Nor could small vessels on the Pacific or the Gulf be prevented from landing a load of silver at any time in insignificant ports. If the bullion were worth $1.29 on one side of an imaginary line, and only $1.00 on the other side, it would cross in great quantities, and no power could stop it. Neither could a movement of silver from Europe across the Canadian border be prevented. With cars of all sorts crossing every day, and fishing, coasting, and ferry-boats constantly coming and going, practical exclusion would be impossible." This compromise, the Washington correspondent of the Philadelphia *Press* tells us, is fathered by F. C. Newlands, a very rich man, son-in-law of the late Senator Sharon of Nevada. According to the same authority, Mr. Newlands testified before the Silver-Pool Investigating Committee that the expenses of the silver lobby were paid by the owners of silver mines and silver bullion. He also testified that he bought silver bullion for speculative purposes previous to the passage of the Silver Bill at the last session, and that he is now carrying silver bullion.

It appears that the mortgage companies are waking up to the necessity of making their loans payable in gold. A telegram from Kansas to the *Herald* says that the loan agencies are notifying the mortgageors to pay up, and that the latter, when seeking fresh loans, are confronted with a requirement to sign a gold note. Of course it is optional with them to take the new loans on those terms or not; but there is no money to be had in that quarter on any different terms. This new condition has led to a great outcry among the mortgaged, who, by a remarkable perversion of facts and logic, see a gross injustice in a requirement that they shall pay as good money as they receive. Their conception of good faith and equity implies that a man ought to be able to borrow something that is worth 100 cents gold and pay it back at the rate of 80 or 70 or 50 cents of the same standard. They will not hereafter find lenders of the same mind. Two or three years ago the *Evening Post* made an inquiry among the mortgage companies to see how many of them were in the habit of putting the gold requirement into their notes or bonds. Only one such company was found. If the present scare is not sufficient to bring the remainder of them to their senses, they will deserve to be paid in silver at some future time; that is, to lose 20, or 30, or 50 per cent. of their money. In California, where it is supposed that all persons are theoretically silver-men, all contracts for the loan of money, whether mortgages or ordinary notes of hand, are made payable specifically in gold. In politics these interesting people are strongly in favor of silver, but as a matter of business they are more "gold-buggy" than Wall Street itself.

Why Gov. Hill failed to receive the Watterson letter in November last, when it was sent, remains a mystery. The letter has not been returned to the writer through the Dead-Letter Office, and the only explanation of its loss is a possible defect in the postal delivery service at Albany. The suspicion that there is a defect of this kind there is strengthened by the seeming failure of another important letter to reach the Governor within the past few days. Mr. E. Ellery Anderson, Chairman of the anti-free-silver meeting in Cooper Institute, says he addressed and mailed a letter to the Governor, on Friday week, at the same time that he mailed one to Mr. Cleveland, and that the following passage appeared in both letters, accompanying a formal invitation to attend the meeting: "We are deeply impressed with the gravity of the situation, and earnestly hope that in person or by letter you will give expression to your views, and add the weight of your opinion to the movement against the bill for the free coinage of silver." Mr. Cleveland, as the whole country is aware, received his let-

ter and acknowledged it, but Mr. Anderson has up to date had no response whatever from the Governor, not even a formal acknowledgment of the invitation with regrets or anything else. Did that letter also fail to reach the Governor? If it did, the postal service at Albany should be investigated forthwith, and a system of checks and receipts arranged between the Albany Post-office and the Executive chamber.

It is not surprising that Gov. Hill should be unwilling to have it thought that he ever received Mr. Watterson's letter, for it is of a kind which no Presidential aspirant would like to have the public think he had received and read without a protest. That it was written and sent appears to be undoubted, and if the Governor never received it through the mails, he has received it now, and is thoroughly cognizant of its contents. It came to the public attention in the very nick of time to bring out in its strongest light the character of the politician to whom it was addressed. It raised once more the question of Gov. Hill's loyalty to Mr. Cleveland in 1888 at the very moment when the Governor was appointing a typical Hill man in place of an honest man whom he was eager to get out of office because he was a friend of Mr. Cleveland. It is small wonder that the Governor's equanimity was violently disturbed by the coincidence.

The appointment and confirmation of Pierce as Superintendent of the Insurance Department recalls another disgraceful fact in the recent annals of the State, viz., the passage by the Legislature and the approval by the Governor of a bill releasing the life-insurance companies from the payment of nearly a million dollars of back taxes due from them to the State, and at the same time repealing the tax law under which those arrears had accrued. Any agency powerful enough to accomplish that feat might, without doubt, get a pliable Superintendent of Insurance appointed by a pliable Governor and confirmed by a pliable Senate. All the shady Republican Senators voted for Pierce, together with two who are not so classed, but who have added nothing to their reputations by their course in this instance. It is in affairs of this kind that personal character is strengthened or weakened, and it is a loss to the State as well as to the individual when any Senator who has enjoyed the full measure of public confidence is found in bad company. The confirmation of Pierce, although not the worst thing that has happened at Albany in late years, is a very disagreeable omen.

The position in which the vote on the Civil-Service Commission clause in the Legislative Appropriation Bill left the Commission as regards funds appears to be this: Messrs. Grosvenor and Cannon led the attack on the Commission by means of points of order, which finally, with the aid of Mr. Payson in the chair, cut down its appropriation to the exact sum allowed for its work when it was first started. Its working force has been since several times increased beyond the allowance made in the organic act, by vote of the House, as in the case of all other departments, without any technical objection from any quarter. The trio had got the Commission seriously crippled when Mr. Dingley of Maine came to the rescue, and moved an additional appropriation of $36,400, to "give effect to and execute the provisions of the act." Against this the Grosvenor point of order was of no avail, and it was carried, leaving the Commission in possession, if the Senate concur, of an income of $53,700, or $1,500 more than it originally asked for. The view that this last appropriation could not be used in employing additional clerks is pronounced absurd by the best parliamentarians in the House, so that it appears as if the enemies of the Commission had been hoist with their own petard.

This whole matter is a striking illustration of the mischief of allowing discredited politicians to come back after their defeat at the polls and continue to legislate as if nothing had happened to them. Both Cannon and Grosvenor are now acting in the House without the smallest responsibility to any one. The voters cannot now inflict any punishment on them for anything they have done or left undone since November 4, and they will enjoy similar immunity between now and March 4. We see the result in Cannon's conduct. Last year he took the very ground in defence of the Commission which he has this year been assailing, and his exact language on that occasion was read to him from the *Congressional Record* on Friday without producing the smallest impression on him. Why did it produce no impression on him? Simply because he is now for the moment out of politics, and can give way without fear of consequences to all the promptings of his corrupt nature. Both he and Grosvenor think they can do as much mischief as they please, especially mischief which will spite the Mugwumps, reformers, professors, and mollycoddles—classes whom all Republican politicians who suffered at the late election hate with a fervent hatred.

Republican politics in Ohio are in a very mixed condition. One faction of the party is desirous of running Mr. McKinley for Governor, and another faction is still as clamorous for Mr. Foraker as it was before his defeat in 1889. Mr. McKinley's recent speech at Toledo was designed to start a boom for his candidacy, but it seems to have been a failure in that respect. Just what the matter was is not stated, but at this distance it looks very much as if he put too heavy a dose of demagogism into his views for even Ohio Republicans to swallow without protest. After repeating his well-known denunciation of cheapness as nasty and unpatriotic, he came out squarely in favor of free silver, thus committing himself in favor of cheap money—a variety of cheapness to which his party in Congress and in the nation is supposed to be antagonistic. It is small wonder that Ohio Republicans are becoming confused when they see their ablest leader, Senator Sherman, combating free-silver delusions in one branch of Congress, while their leader in the other branch takes the stump and tells them that Mr. Cleveland, in opposing the same delusions, is "dishonoring" one of the precious metals. Neither is it surprising that Mr. Foraker, who was supposed to be dead politically, is coming to life again, for Mr. McKinley's Toledo speech makes even Foraker appear rational.

The long struggle over the Senatorship in the South Dakota Legislature ended on Monday in the election of James H. Kyle, a representative of the Farmers' Alliance. The new Senator will be the youngest member of the body, being but thirty-six years old. He is a native of Ohio, a graduate of Oberlin College, and a Congregational clergyman who has officiated in Utah and South Dakota. He was reared a Republican, but had been growing lukewarm in the faith until McKinleyism drove him out of the party. His colleague, Mr. Pettigrew, it will be remembered, voted with Plumb of Kansas and Paddock of Nebraska against the McKinley Bill on its final passage, and it is safe to count upon both Kyle and Pettigrew as supporters of tariff-reform measures in the next Congress. The changes already made in the Senate show that it will be impossible in the Fifty-second Congress to secure a majority in favor of McKinleyism. These changes transfer four seats from the Republicans to the opposition, and reduce the majority of the former from fourteen to six, which will probably be still further reduced when the Illinois contest is ended.

We scarce expected to be taken in earnest when we remarked, three months ago, on the French customs restrictions upon importation of Dr. Koch's lymph, and suggested that though it had been discovered too late for Mr. McKinley to include it in his anti-civilization schedules, it might yet be possible to exclude the lymph from this country, or at least to delay its entrance and increase the burden of the sick, by taxing it as a manufacture of something-or-other otherwise unprovided for. But, according to the *Tribune*, this has been done. A package of the lymph, "addressed to Dr. Winzen, No. 96 John Street, came through the German mail recently, and was seized by the postal customs officials. The appraisers put a value of $6 upon the medicine, upon which duties of 25 per cent. were assessed. The doctor paid this amount and took the lymph away. There was less than a tablespoonful of the compound."

Mr. Sherman made, in the Committee of the Whole, an amendment to the Copyright Bill which the Senate has since rejected, and which would certainly have been likely to lead to delay, and as drawn would have abolished American domestic copyright, allowing the importation of foreign editions of copyrighted books on paying the regular tariff duties. Nevertheless it is a good amendment in itself. All prohibition of the importation of editions of a book which is not obscene and which has been honestly come by, is in our

day an anachronism. The American publisher is amply protected against foreign competition by the tariff, and if there be any number of persons, however small, who would prefer, for typographical or other reasons, the foreign to the domestic copy, they ought to be allowed to purchase it. We observe that Mr. Vance of North Carolina vigorously attacked all international or other copyright, quoting in support of his contention Tweed's old friend, the editor of the *Sun*, as "a very high authority in matters pertaining to literature," in the interest of the "poor and ambitious boy," in whose hands he wished to place a "cheap book." And yet would it be possible to do a greater injury to a poor and ambitious boy than to furnish him, at the very outset of his career, as one of the instruments of success, with a book whose cheapness was due to its having been stolen? Why should an American boy be more indifferent to the way in which he gets his books than to the way in which he gets his trousers? There are no trousers so cheap to-day as stolen trousers, but what honest man would tell a child that if his trousers were cheap, it made no difference where they came from? Trousers are just as necessary to a boy's success in life as books. No poor boy in America has ever achieved wealth or distinction without trousers. Mr. Vance himself is a shining example of what trousers may do for a man; but he is far from believing that trousers may be obtained in any manner whatsoever, and that the tailor's rights should never stand in the way of the wearer's necessities.

The Republicans in the Connecticut Legislature have at last taken the first step towards a rational settlement of the controversy over the State offices which has been going on for more than a month past. The House of Representatives, which is controlled by that party, has adopted a resolution declaring that, whereas the differences of opinion between the two branches concern the peace, good order, and welfare of the State, and these differences depend largely upon questions of constitutional and statute law, the House declares its willingness to unite with the Senate in the passage of a joint resolution requesting the advice of the judges of the Supreme Court on all the questions of law involved in these differences, and pledges itself, in case the Senate will join in such reference, to take such action, and pass, in concurrence with the Senate, such legislation as may be necessary to carry into effect the opinion of the judges. The Democrats have all along favored the idea of an appeal to the courts, and no reason is visible why the Senate, which they control, should not join in the reference proposed by the House. It is earnestly to be hoped, however, that the Legislature will not rest content with securing a settlement of the pending controversy. This long and discreditable struggle over the State officers is the outgrowth of an antiquated Constitution, and a recurrence of the same trouble will always be possible so long as the provisions of that instrument respecting those offices remain unchanged. If in any Southern State there were a system under which 42,000 voters had 133 members in the lower branch of the Legislature, while 92,000 voters had but 117 members, it would be denounced by Connecticut Republicans as an outrage. It is no less an outrage when such a system exists in Connecticut.

Mr. Hiram Howard has introduced in the Rhode Island Legislature a Corrupt Practices Bill somewhat more stringent in its provisions than a similar one which he advocated in the same body a year ago. It prohibits the contribution of money in any form by any person, agent, committee, company, association, or corporation, to any person or organization of any kind for use in elections, and forbids the receipt of such contributions by anybody for such use. Every candidate for office who expends more than fifty dollars in any way in an election is required to file, within ten days after election, a sworn statement of the use made of it, and the same requirement is made of agents and committees disbursing more than $50. Penalty of violation of the law is fixed at a fine not exceeding $1,000 or imprisonment not exceeding one year, or both. Any person testifying to violations is granted immunity from the penalties, and any person supplying testimony which leads to conviction, may recover in an action of debt from the person convicted the amount named in the forbidden transaction.

A telegram from Bahia, Brazil, to the *World* says that the merchants at that place are by no means pleased with the Reciprocity Treaty negotiated by their Government with Mr. Blaine. On the contrary, they view it with the "greatest dissatisfaction," and intend to use their influence to prevent its ratification. The new Constitution of Brazil has not yet been adopted, and no treaty can be ratified before that event takes place. The Bahia merchants find that they are no better off under the treaty than they were before, since the free admission of coffee, their chief staple, to the United States, has been going on for some twenty years, and the free admission of raw sugar, which begins on the 1st of April, applies to all sugar-producing countries as well as to Brazil. Moreover, they do not see why the United States should have an advantage in trade as against Great Britain. There is no treaty between Brazil and Great Britain containing the "most-favored-nation clause," but there is nothing to prevent the making of such a treaty, or a Reciprocity Treaty in terms like that between Brazil and the United States. The resident English merchants have been greatly stirred up by the Blaine-Fonseca Treaty, and are moving decisively to secure like advantages for themselves.

The Liberal Unionists in England are vigorously engaged in what would be called in American slang "working the morality racket" against the Home-Rulers; that is, they have risen far above the murky political atmosphere, in dealing with the Irish question, and dwell now in the serener air of pure righteousness. Those of them who can get over Parnell's adultery—and they are not many—are particularly afflicted by his admission to the Parnell Commission that he had told a falsehood (which, curiously enough, turned out not to be a falsehood after all) on a certain occasion, with the intent to deceive the House of Commons. "To think," they say, "that we were on the verge of turning over the Government of Ireland to a man who had lied to the House of Commons." But they are very apt to suggest that Gladstone, on the whole, everything considered, is a greater liar than Parnell; and Lord Salisbury the other day at Cambridge, discussing the conflict of veracity between the two about what passed at Hawarden, declared that Parnell was the more worthy of belief. This has revived—we say revived—the old question, "Is Lord Salisbury himself worthy of belief, for has he not done a far more awful thing than lie to the House of Commons—lied to the House of Lords? Think of lying to the House of Lords!" In other words, the wicked Home-Rulers are recalling the fact that in 1878 Lord Salisbury was asked by Lord Grey, in the House of Lords, whether "there was any truth in the statement which had appeared in the *Globe* last Friday as to the terms agreed on between this country and Russia." That statement was that a secret memorandum had been agreed upon between Lord Salisbury and the Russian Minister, settling in advance the chief points in the Treaty of Berlin afterwards concluded, and thus making the subsequent debates at the conference between Lord Beaconsfield and Russia a piece of acting intended to humbug the British public, and give Beaconsfield the air of a valiant defender of British honor. To this question Lord Salisbury answered: "The statement to which the noble Lord refers, and other statements I have seen, are wholly unauthentic, and are not deserving of the confidence of your Lordships' House." In a few days it appeared that the memorandum actually existed when Lord Salisbury said this, and that the *Globe's* version of it was substantially correct. The best of the story has to come. After he had made this insulting speech about Mr. Gladstone, the Manchester *Guardian* recalled the memorandum story, and some one wrote to Lord Salisbury to know if it were true. His secretary answered: "I have to say in reply that you may deny the statement, so far as it refers to Lord Salisbury, without hesitation." As the matter is wholly of public record, this permission to "deny without hesitation" must be meant as a permission to his correspondent to incur, if he pleases, the pains and penalties attaching in nearly all religions to unrepented and unconfessed mendacity. But think of the government of Ireland being now in the hands of a man who has told a falsehood for the purpose of deceiving the House of Lords!

MR. CLEVELAND'S LEITER.

No small scrap of writing in recent years has produced so much commotion and attracted such general attention as ex-President Cleveland's brief letter to the President of the Reform Club on the silver question. It comes before the public at a critical juncture. A bill is pending in the House of Representatives for the free coinage of silver, *i. e.*, to establish the silver standard in place of the gold standard. This bill has been opposed by all except a handful of the Republicans in the Senate, and is now opposed by nearly all the Republicans of the House. It was supported by all except a handful of Democrats in the Senate, and is now supported by a majority, probably a large majority, of those in the House. There is nothing in the last national platforms of the two parties that warrants this distinction. On the contrary, the Republican platform is more silverish than the Democratic, for, while the latter is absolutely silent on the question, the former contains a paragraph suggesting that the Republicans are better friends of silver than the Democrats. That paragraph says:

"The Republican party is in favor of the use of both gold and silver as money, *and condemns the policy of the Democratic Administration in its efforts to demonetize silver.*"

In spite of these public outgivings, the Republican party turns up in Congress as the party demonetizing silver, and the Democrats turn up on the opposite side. Silver, be it remarked, is demonetized as long as it is not received at the mint in any quantity and coined for and on behalf of the persons presenting it for the purpose. Upon this point Mr. Bland is right, and always has been right. Silver dollars are at present a part of the fiduciary currency of the country. They are redeemed by the Government in gold just as the greenbacks are redeemed. They possess an intrinsic value of 80 cents each. The remaining 20 cents is fiduciary. Therefore the Republican national platform really made it an accusation against the Democrats that they had, up to that time, prevented the free coinage of silver. They had prevented what all except a mere handful of Republicans in both houses of Congress are now trying with all their might to prevent. This seems to show again what lying and blackguard documents national platforms may be, when constructed by "scurvy politicians who seem to see the things they do not."

As long as the Democrats were charged with the responsibility of the national finances, they were careful and conservative. As soon as the Republicans got the reins of power they became careful and conservative. They nevertheless passed the law of last July more than doubling the Government's purchases of silver. They did this, however, in order to avoid something worse, for the Democrats, being no longer charged with the responsibility for the safety of the nation in its public and private finances, were crowding them with a free-coinage bill. After all is said, in and out of platforms and in and out of office, the Democrats are more of a silver party than the Republicans. When, as sometimes happens, the Republicans pretend to be more silverish than the Democrats, they are not truthful. And this remark applies to Mr. McKinley's speech at Toledo on Thursday evening, in which he said:

"During all of his [Cleveland's] years at the head of the Government he was dishonoring one of our precious metals, one of our own great products; discrediting silver and enhancing the price of gold. He endeavored even before his inauguration to office to stop the coinage of silver dollars, and afterward, and to the end of his Administration, persistently used his power to that end. He was determined to contract the circulating medium and demonetize one of the coins of commerce, limit the volume of money among the people, make money scarce and therefore dear. He would have increased the value of money and diminished the value of everything else—money the master, everything else its servant. He was not thinking of 'the poor' then. He had left 'their side.' He was not 'standing forth in their defence.' Cheap coats, cheap labor, and dear money; the sponsor and promoter of these professing to stand guard over the welfare of the poor and lowly—was there ever more glaring inconsistency or reckless assumption?"

That speech of McKinley's has the brassy ring of the demagogue as distinct as anything ever uttered by any silverite on either side of politics.

Well, things had come to this pass, that the great gains made by the Democrats on the tariff question were put in jeopardy by the incoming of a new issue. Those Democrats who talk about settling the silver question now, so as not to have it in the way in 1892, are simpletons. They assume that changing the standard of value from gold to silver, and unsettling all contracts and changing the terms of all business undertakings and the purchasing power of wages is a slight thing, that it has no consequences that can project themselves into the next Presidential campaign, that it is a summer cloud that may overcome us without our special wonder. Never was there a more prodigious mistake. The truth is, that a free-coinage bill passed and put into effect now would obliterate every other issue from the political field for years to come. We are not now considering the merits or demerits of the measure in itself. We merely say that it is charged with dynamite to such an extent that the McKinley Bill would disappear from the field of political strife in a twinkling. The Democrats would leave the firm and assured ground on which they now stand to take a leap in the dark.

Undoubtedly Mr. Cleveland had these things clearly in view when he wrote his letter to Mr. Anderson. He has a habit of saying exactly what he thinks on fitting occasions. Aside from the gift of political courage, he has sufficient political sagacity to see that it is most unsafe to drop a good piece of meat in order to dive after something else that appears to be in sight but may turn out to be an optical illusion. There has been much vaporing over this letter in the South and West, but it will be of short duration. The net result will be that foretold by Congressman Peel of Arkansas to a *Tribune* reporter, viz.:

"The letter shows that Mr. Cleveland has lots of courage, and that he has no disposition to deceive any one. The position he takes is not a surprise; it merely clears away the doubts of those who thought he might have changed his views after a more careful study of the question. He holds the same views still. The letter will strengthen him in New York and throughout the East. It will probably do him some damage in the South and West, but his bold stand on the tariff has endeared him to the hearts of the Western and Southern people. They would rather vote for him than for any other living man. They will respect his frankness and courage in maintaining his personal convictions, even if they do not agree with him, and they will probably be for him anyhow."

THE BARRUNDIA DEBATE.

No better statement of the case against the Navy Department could be made than Mr. Dalzell's on behalf of Commander Reiter. Mr. Lodge, speaking on behalf of the Administration, acknowledged that San José was a Guatemalan port, but pleaded that it was not much of a port, as the coast at that point was "straight as a rule." Barrundia's "character was none of the best"—"probably he had led a bad life"; but he was apparently only pursued as a political refugee. It would therefore have been "chivalrous" in Commander Reiter to have gone out and offered him an asylum on board his ship. Moreover, Commander Reiter ought to have been on board the *Acapulco* when the officers came off to execute the warrant, instead of staying in the *Thetis*. He ought to have been roused by the sound of the pistol-shots; and when the *Acapulco* hauled down the Guatemalan flag and hoisted the stars and stripes, he ought to have regarded it "as a signal of distress," although no such signal is known to the signal code. It was "a disgrace to have a man shot down in that way and under these circumstances"—these being the circumstances: On hearing from the Guatemalan commandant that he had come to arrest him,

"Gen. Barrundia said 'Bueno,' and immediately reached for a revolver which was concealed under a mattress in the upper bunk, and fired two or three shots through the doorway between them. The Captain and the commandant beat a hasty retreat aft, taking refuge in an unoccupied state-room. They were followed by Barrundia, firing wildly. He stopped and fired several shots into the state-room where the captain and commandant were concealed. He then apparently ran forward and crossed through the 'social hall' to the starboard side, where he fired forward and aft, then crossed to the port side again and started forward, when he fell. The detectives, as near as I could determine, ran out of the 'social hall' and forward when Barrundia first commenced firing, but some time during the mêlée returned and began discharging their revolvers at him."

That is, it somehow disgraces the American Navy if a man resisting lawful arrest (Mr. Lodge does not deny the legality) on board an American merchant vessel, draws a revolver and begins to run round the ship "firing wildly" at all persons within sight, and finally falls under the return fire of the detectives whom he is trying to murder. We have "never refused asylum to political refugees," and ought not to begin now, but not one of the authorities Mr. Lodge cited on this point makes it incumbent on American commanders to pursue refugees with offers of asylum. Barrundia did not ask for asylum. He refused to see Commander Reiter on board of the *Acapulco*, and yet it was Commander Reiter's duty to go out to sea to meet him and urge him to take refuge with him.

Nothing so ridiculous as this has yet come up in any of these controversies. All the precedents relating to asylum for foreign refugees assume that the asylum is to be asked for. No consul or naval commander has ever before been censured for not inviting a foreign runaway to take shelter on board his ship. Whenever they have been hauled over the coals, it has been either for totally refusing it *on demand*, or for according it too freely on demand. Mr. Lodge quoted our Minister Morris's giving shelter to Frenchmen in danger of their lives during the Reign of Terror in Paris, and the Koszta case at Smyrna, neither of which had the remotest resemblance to the Barrundia case. He cited also a passage from Hall's 'International Law,' showing that captains of men-of-war ought to give shelter to political refugees, but was indiscreet enough to cite also the following qualification:

"He [the fugitive] should not be sought out or invited, but if he appears at the side of the ship and asks admittance, he need not be turned away."

Mr. Lodge's mode of making this qualification is very curious. "This refers," says he, "to political fugitives escaping from the shore. They ought not to be sought out or invited," but the case is very different if they come on ships. In this latter dictum, we need hardly say, he cites neither Hall nor any other authority. There is none. This is all the law he gets into his argument. The rest is commendation of "chivalry" and high spirit and daring on the part of our naval officers. Unconsciously, doubtless, his whole statement was highly apologetic, but in making it apologetic, and thus admitting that the Barrundia case was a doubtful one, with a great deal to be said on both sides, he passed an implied condemnation of the strongest kind on the conduct of the Secretary of the Navy in inflicting a severe and even abusive reprimand on an officer like Commander Reiter, of thirty years' unblemished standing. Naval officers in foreign ports have to be governed by international law or executive precedents and instructions. No other rules for their guidance can be given them. They cannot be sent abroad with general directions to be brave and chivalrous, and to take responsibility enough but not too much, for this would put us in constant danger of war with foreign Powers in some distant quarter of the globe, through somebody's rashness, or irritability, or want of judgment. They have to be, always have been, and always will be, tied down by books and codes, binding alike on the cautious and the bold, the cool and the choleric, on teetotalers and heavy drinkers. Without this our navy would soon be a floating bedlam. The fact that Mr. Lodge has not been able to cite against Commander Reiter a single precedent or usage disregarded, a single rule or instruction violated, is, therefore, an implied censure on the Navy Department, almost painful in its gravity, coming as it does from its own champion. The Department has inflicted serious punishment on an officer of good repute for an offence which it cannot define, or explain, or illustrate, except by a series of generalities and assumptions which could not possibly be used in the government of a military organization. The enlargement of the duty of granting asylum in public ships on demand into the duty of cruising in search of foreign fugitives and forcing asylum on them without demand, is almost a sign of administrative frenzy.

One of the most curious features in the debate was the appearance of Mr. Boutelle of Maine as an uncompromising critic of the Navy Department. He denied the Secretary's right to inflict such punishment as had been inflicted on Commander Reiter except by sentence of court-martial. "He would not have written the letters addressed by the Secretary to Commander Reiter, and if he had written them, he would not have published them before their delivery." He asked whether if the British mail steamer, the *Trent*, had carried Mason and Slidell into the port of New York, en route to England, we would not have arrested them; and whether if a British man-of-war lying in the East River had attempted to interfere, we would have tolerated the interference for one moment; and he closed with the following most rational and weighty remark:

"In conclusion, I desire to say that I have little sympathy with the idea that the principal duty of the United States Government and its navy is to send its ships around the globe to hunt up the political conspirators, revolutionists, anarchists, and nihilists of other countries in order to aid them in their attempts to overthrow established and orderly governments, or to protect them from the just punishment of crimes not only against friendly nations, but against humanity. That sort of business does not seem to me the most glorious to which we can devote the American flag."

This is an observation which ought to have come from Mr. Lodge, considering his training and antecedents, rather than from Mr. Boutelle; but apparently no job the Administration can assign Mr. Lodge now does violence either to his tastes or his principles.

QUAY'S ANSWER.

MR. QUAY has at last answered the charges made against him in the *Evening Post*, nearly nine months after their date. Unfortunately, the answer is a simple denial, such as is made by every malefactor who is not taken in the act. Such denials, as is well known, have no value either in law or in morals. They have to be fortified by the production of some other kind of evidence. Mr. Quay produces no such evidence with regard to any of the more serious parts of the accusation against him.

Did space permit, it would be easy to show the way in which he proposes to make his escape, by printing in parallel columns the two leading charges made by the *Evening Post*, with Quay's answer to each. By those who make the comparison it will be observed that he himself corroborates the leading points in the first charge, namely, his being engaged in a joint stock speculation with Walters, the State Cashier; the abstraction by Walters of a considerable sum from the Treasury to be used in this speculation; the loss of the money; and the borrowing of $100,000 by Quay from Senator Cameron to make good his share of the loss. The only attempt he makes to extricate himself is an insinuation—not an assertion—that Walters took the money without Quay's knowledge or consent; but he does not explain why if Walters, without his knowledge or consent, was guilty of embezzlement, he (Quay) felt bound to make good the deficiency by borrowing an enormous sum from a friend without security. Now Walters is dead. He committed suicide. He cannot throw any light on the transaction. But there are two persons living who can—Senator Don Cameron and Wayne MacVeagh. They were both present at the interview at Quay's house at which the money was advanced by one of them. Neither will speak unless called upon by Quay. Both, we are sure, will do so if called upon by Quay. Why does not Quay require them to tell all they remember of the transaction which took place at his house early in May, 1880, and which is described with some minuteness in the *Evening Post's* pamphlet? They can, if Quay is innocent of all share in that defalcation, set him right at once. Nobody else can. Quay's uncorroborated testimony in the matter is worthless. As long as he refrains from producing them as witnesses, we must consider him guilty of having aggravated the offence of embezzlement by the offence of prevarication.

His mode of dealing with the second principal charge is still more unsatisfactory. It will be seen, by reference to the above pamphlet, that the *Evening Post* accused him of a second raid on the State Treasury, in having when State Treasurer taken $400,000 of the State funds himself, this time without a confederate, in order to enable him to take part in a speculation in the bonds of the North Chicago Street Railroad Company, which were offered to him on favorable terms. The above "sum of money," said the *Evening Post*, "Quay coolly took out of the State Treasury and sent it to Philadelphia, where it was deposited in the People's Bank, the depository of the horse-railroad syndicate, and so paid for the bonds. The President of that bank was and is W. H Kemble (the author of the epigram 'Addition, Division and Silence'), to whom reference has already been made." It will be observed that the *Evening Post* did not say he took "securities" of any description out of the State Treasury. It said he took cash—that is, $400,000 in checks, drafts, or lawful money. Now read his answer to this:

"It is charged that again I used moneys belonging to the Commonwealth of Pennsylvania to purchase bonds or stock or both of a Chicago street railway. I was invited by friends in Philadelphia to join in the purchase of street-railway property in Chicago, and did so, borrowing the money upon my own collateral from the People's Bank in Philadelphia. I stood upon the same footing with the other gentlemen concerned, and it was a perfectly straightforward business transaction, and had no connection in any way with any public fund or public interest. The charge that securities belonging to the State of Pennsylvania were used in the transaction is false and impossible of truth. The only negotiable securities held by the State of Pennsylvania are the registered bonds of the United States, transferable only on the books

of the National Treasury by the Auditor General, Secretary of the Commonwealth, and State Treasurer, acting conjointly, after having filed a certificate with the Governor in their official character."

Now, where did he get "collateral" at that period for a loan of $400,000, seeing that such collateral must have been worth at least $440,000?

It is not necessary to pursue this examination further. The other charges are comparatively insignificant. It is not surprising that, after listening to his defence, "the Senate went on with its routine business as if there had been no interruption, and the visitors left the galleries with an air of disappointment." No judgment on this notorious profligate, however, will be full or satisfactory which does not take into account the fact that Mr. John Wanamaker, our Postmaster-General, a leading business man of Philadelphia and proprietor of the Bethany Sunday-school, knowing all about Quay, raised and handed over to him, to be expended without vouchers, the largest election fund ever seen in the United States, and got, apparently in return therefor, a seat in the Cabinet of the President of the United States.

A GAP IN PRACTICAL EDUCATION.

A WIDESPREAD discussion of one of the most important and most difficult problems of education, in elementary as well as post-graduate departments, has lately been provoked by the action of several dissimilar educational bodies in different parts of the country. One line of argument, however, which may be derived from a consideration of facts, has not yet been as fully presented as, from its practical bearings, it deserves to be.

Every one, or at least every one whose sanity upon social topics would pass unchallenged, admits the educative influence of contact and intercourse between persons of opposite sex at some age or other. If not in early or immature periods, at least when years are ripe for it, the influence of the masculine on the feminine mind, or the reverse, is held to be good for each. But, owing to the present largely prevailing system of separate education, and to certain inevitable conditions of society, two classes of women who are already important factors in the community, and who promise to become increasingly influential as time goes on, are practically shut off during the most plastic and some of the most active years of life from opportunities for free and natural interchange of thought and opinion with members of the other sex.

The first of these two classes consists of graduates of women's colleges who immediately upon leaving college become teachers in girls' schools of the higher grades. The women's college necessarily practises, more or less strictly, a system of seclusion for its students. It has a staff of celibate instructors living within its own boundaries. It follows from the nature of the case that students are largely restricted to the influence of the feminine intellect, both within and without the lecture-room. It is not assuming too much to say that such men as find their way as professors to the women's colleges are, with a few notable exceptions, among the most inexperienced of their profession, who are using the post in hand as a stepping-stone towards the first vacancy they can fill in a non-feminine institution. It is, moreover, questionable whether, with the most earnest and honorable intentions, such instructors, themselves probably fresh from unmixed classes of their own sex, can put forth their best efforts and accomplish their best work in classes in which there is not a single member of the order they have been accustomed to. The mind of a man must, under such circumstances, be incapable of the full tone and vigor it would have if he were working at least partially with men.

From the homogeneous mental atmosphere of the college the graduate who is to become a teacher makes but a single step into a class-room of girls. Her associates in teaching are women who, like herself, are debarred even the masculine element of boys, "to bring outside life into the school, to know what is going on in the world, to illustrate the lesson from what happens in the streets and on the wharves." Naturally, young teachers can seldom be fortunate enough to find positions near enough to their homes to be able to enjoy the companionship of fathers and brothers. More generally they are forced to live where they are dependent upon their own resources for recreation and pleasure. However clever and conscientious their teaching may be, it is impossible not to believe that past and present conditions have developed a one-sidedness of outlook, from which pupils, in their turn, must suffer in the development of mind and character.

The second class that must be hampered in practical usefulness by the isolation of the sexes in education is that of the women doctors who are trained in medical colleges for women, and who "set up" as practitioners in places where they likewise are dissociated from home ties. Such practitioners, as the friends of medical education for women repeatedly remind us, are constantly called upon to act not merely as physical, but also as spiritual or moral advisers of the young and middle-aged of their own sex. It is evident that in many palpably probable cases they would be better fitted to fulfil the latter function if circumstances had given them a nearer acquaintance with the mental and moral peculiarities of the other half of the human race.

If a man who has adopted teaching as a profession marries, he still goes on with his work. Not so a woman. When she marries, she resigns her post, which is filled by a perpetual supply of celibates. In the case of the male members of the other professions the feminine element is seldom long lacking. Doctors, indeed, proverbially marry young, there being a definitely recognized professional advantage in their doing so. But, matrimony apart, young men are free at any period of their lives to seek the society of women in their own homes. Young women are of necessity without this resource as regards men. It is worth while to consider whether the interests of society would not be better served if more normal and extended culture were given to large bodies of able women by a broader and more consistent system of education.

BALKAN PROBLEMS.

EUROPE is at peace, but the Eastern Question survives to plague European diplomacy, and ominous mutterings from the Balkan Peninsula reach us in fragmentary cable reports of a plot to overthrow Ferdinand of Bulgaria, the serious illness of Alexander of Servia, the fall of his ministry, a rising of Albanians, and the wholesale expulsion of Nihilists from Bulgaria.

Of these, the last report is probably the most significant, as it denotes a change in the attitude of Premier Stambuloff towards the Russian Government, which demanded recently of Bulgaria the extradition of thirteen Nihilists supposed to be plotting against Russia on Bulgarian soil with the knowledge and connivance of the Bulgarian Government. The Russian note was delivered by the representative of Germany at Sofia, as Russia has never recognized Ferdinand's Government, and M. de Giers reinforced his demand by a circular note addressed to the Cabinets of Berlin, Vienna, Rome, and London, calling attention to the harboring of Nihilists by Bulgaria. To this note M. Grecoff, the Bulgarian Minister of Foreign Affairs, returned a verbal answer, whose firmness was explainable only on the assumption that his course was prompted by Austria, in spite of her having joined the other great Powers in formally approving Russia's action. After premising that Bulgaria would never consciously lend her aid to the furtherance of criminal plots against any foreign government, M. Grecoff called attention to the vagueness of Russia's charges, to the fact that several of the supposed Nihilists were entirely unknown in Bulgaria, flatly refused to surrender naturalized and peaceable Bulgarians, no matter what their political antecedents in Russia had been, and neatly turned the tables against Russia by pointing out the well-known fact that the Russian Government not only harbored but rewarded Bulgarian Nihilists, like Grueff, Bendereff, and Zankoff, who had been engaged in the kidnapping of Prince Alexander. The Bulgarian Government, he said, had only one Russian criminal in its employ, the historian Dragomanoff, whose crime, in Russian eyes, consisted in his having published several works in the dialect of Little Russia. If M. Stambuloff has since, after all, decided to surrender the unfortunate refugees who have hitherto enjoyed Bulgarian hospitality, it is very evident that the journey of the Austrian heir-presumptive, the Archduke Franz Ferdinand, to the Court of St. Petersburg, has borne fruit, and that a hint to Bulgaria was the direct result of the *rapprochement* effected between Russia and Austria.

Russia, in winning Austria over to her definition of the term "Nihilist," has thus virtually secured a vindication of her course in the Lutzki affair, which during the last few weeks has been so much discussed in the European papers. Lutzki was a Russian

engineer who had for some time been quietly living in Bulgaria, and who recently went to Constantinople, where he was arrested by Russian police agents and thence transported to Russia without process of law of any kind. In spite of the storm of indignation excited by this violation of international law, Russia has never deigned to particularize her charges against the unfortunate engineer, who, it is announced, has since been sent to Tobolsk. Encouraged by her success in this undertaking, Russia asked Turkey for the surrender of the Mingrelian Prince Nakatchidze, a former associate of Lutzki, and suspected of having been implicated in the railway accident at Borki in which the Czar nearly lost his life. Nakatchidze, in spite of being a naturalized Turkish subject, was arrested by the Turkish authorities, but soon set at liberty, as Russia failed to make out a case against him. That the final expulsion of all Nihilists from Bulgarian territory will incline Russia more favorably towards Prince Ferdinand is, however, altogether improbable. The very successes which his Government has recently achieved, the readiness with which Bulgaria met the demand for the payment of a war debt suddenly sprung upon her by Russia, and the ease with which she negotiated a loan in Vienna, have only served to exasperate the Russian Government, and it will hardly be unfair to connect the reported conspiracy to overthrow Ferdinand with Russia's undisguised hostility to his Government.

Thanks chiefly to the services of ex-Queen Natalie, Russian influence continues to shape, with much less reserve, the destinies of the kingdom over which Alexander, like his father, the profligate Milan, and his great-uncle Michael, was called as a mere boy to reign. Natalie was the daughter of a Russian colonel—M. Ristitch, the principal Regent, now studiously addresses her as "Mme. Natalie de Ketchko"—and she has always shown herself the willing tool of the Russian Government. Her precise status since her divorce from Milan has never been definitely settled. She entertains the bitterest feelings against M. Ristitch, whom she charges with having been instrumental in procuring Milan's divorce; and she has refused to avail herself of his offer to allow her to pay two or three visits annually to her son, during which time she should reside in the royal palace and be treated with royal honors. She defies the power of the Regents, and continues to reside in Belgrade, holding court in an ostentatious manner, and demonstratively acting as the patroness of a Pan-Servian ladies' association, which has branches in all the principal towns of Old Servia and Montenegro, and whose political aims are undisguised. Her injudicious behavior has alienated from her her former political friends, the Progressists, who had sided with her in her quarrels with her former husband.

The fall of the Servian Ministry was brought about by the opposition of the Radicals to the press law which the Minister of the Interior, M. Gyaya, himself a former Radical, urged the Skupshtina to pass. An amusing illustration of parliamentary government, as understood in Servia, was the introduction of a bill by the Radicals requiring Ministers on assuming office to deposit a certain sum as a guarantee of good behavior, the whole or part of it to be forfeited by delinquencies while in office—a crude but well-meant device on the part of the peasant members of the Skupshtina to imbue the Ministers with a greater sense of their responsibility towards the country than they have hitherto shown.

Commercial interests have of late been paramount in the relations between the European Powers and Rumania, the most progressive of the Balkan States. The Government of King Charles, after having introduced the gold standard in the monetary affairs of Rumania and executed a number of important public works, is on the point of concluding a commercial treaty with Austria-Hungary. The personal affiliations of the King and his literary wife, "Carmen Sylva," have been instrumental in ranging Rumania on the side of the Triple Alliance as against Russia; but even in Bucharest, as the *Indépendance Roumaine* pointed out, Russian emissaries are busily at work. Considerable uneasiness has been created in that city by the recent arrival of the notorious Capt. Bendereff, who was the principal leader in the kidnapping of Alexander of Battenberg, and who is now in the military service of Russia. The continued presence in that city of M. Hitrovo, the Russian Minister, whose connection with the conspiracy of Major Panitza and other disturbances in the Balkan States is well known, is likewise a source of alarm to all patriotic Rumanians who desire to see their country freed from Russian intrigues.

To all these signs of Russian aggressiveness in the Balkan States on the one hand and national self-assertion on the other, the lethargy and declining influence of Turkey form a striking contrast. She has of late been meekly engaged in making concessions to the countries over which she once exercised suzerainty, and trying to live in peace with the rest of the Peninsula; now appeasing Bulgaria by the appointment of Bulgarian bishops in Macedonia; now attempting to satisfy Servia, exasperated by the assassination of her Vice-Consul at Pristina, and all the while manœuvring to postpone the payment of the remainder of an old war debt due to Russia. Whether the amnesty granted to the Cretan insurgents will permanently pacify that part of her domain may well be doubted. Nor can reliance be placed on the effusive professions of loyalty to the Sultan emanating from some of the functionaries of Armenia, so lately the scene of bloody riots. Indeed, their right to speak for Armenia at all is totally denied in a proclamation issued and secretly circulated by the "Central Committee for Armenian Reforms," in which this passage occurs: "If the Armenians were invited freely to express their wishes without being threatened with death or banishment, far from signing, they would spurn with their feet, this infamous address presented to the Sultan by shameless traitors in exchange for the imperial favors, and would express full clearly their disdain for and hatred of the despotic government of the Sultan, and their firm desire to throw off its odious yoke."

GENERAL SHERMAN.

Gen. William Tecumseh Sherman came of the well-known colonial family of that name which was settled at Boston before 1636. Several of them removed to Connecticut very early, and became prominent in the history of that colony. His grandfather, Judge Taylor Sherman of Norwalk, was one of the Connecticut Commissioners to organize for settlement the "fire lands" in Ohio, a reservation appropriated to the sufferers by the coast raids of Arnold and the British in the Revolution. This led to a family migration to Ohio, and Charles R. Sherman, the General's father, fixed his home at Lancaster, in the central part of the State, a pretty town in a lovely region. He attained distinction as a practising lawyer at the local bar, where Thomas Ewing and Henry Stanbery were leaders. The fact that the Indian Chief Tecumseh was recognized as a man of great qualities cannot have better proof than in Charles Sherman's naming his son William after him, in the frontier region where the qualities of the red man usually remembered are those which excite horror and alarm. The same fact shows the large-minded candor of the elder Sherman.

The General was born in 1820, being about midway in a large family of eleven children. His father was Judge of the Supreme Court of Ohio from 1821 till his sudden death in 1829 from over-exposure to the sun in travelling the circuit in June. His accumulations had been small, and the mother, Mary Hoyt Sherman, had need of all the energy characteristic of the colonial families to meet the burden thrown upon her. The hearty good neighborhood of such settlements made her friends efficient in finding means of livelihood for the growing children, and William T. was adopted into the family of Mr. Ewing, whose daughter, Ellen Boyle Ewing, he afterwards married. He had the advantage of education in a good academy at Lancaster, and was appointed a cadet in the Military Academy at West Point in 1836. He graduated in 1840, being sixth in a class of forty-three. He was commissioned in the army as a subaltern in the Third Artillery and was immediately sent to Florida, where the Seminole war was dragging towards its slow termination.

His service till the Mexican war was in the Southern Atlantic and Gulf States, including duties which took him over the ground in which his campaign of Atlanta and the March to the Sea afterwards occurred, and he gained what proved to be invaluable topographical knowledge of a region of which there were no maps worthy of the name. He was at home on recruiting service when the war with Mexico began in 1846, and immediately applied for work in the field. He was ordered to New York, assigned to Company F in his regiment, and with his battery was shipped in the store-ship *Lexington* to California by way of Cape Horn. The ship visited Rio Janeiro and Valparaiso on the route, reaching Monterey after a long voyage of almost 200 days. Mexico was too busy with the invasion by Scott and Taylor to make any strong effort to hold the province of Upper California, and it fell into our hands with the merest show of opposition. There was no fighting for Sherman to do, but the organization of a new dependency was thrown upon the military and naval officers,

and he had a very active share in that work. His energy and strong business sense secured for him the selection as Acting Adjutant-General of the Department, and he rode and sailed from one end of California to the other in his active performance of all sorts of duties connected with the Administration. Gens. Halleck and Ord were among his intimates of his own age, and Hooker served with him a little later.

The discovery of gold, the wild rush of men of all countries to the mines, the submerging of the old Spanish population by the newcomers, the organization of a new State and its admission to the Union, made a wonderful experience for the young soldier, though not strictly of the military kind. Friends in the East tempted him to leave the army and embark in a banking business at San Francisco, in which he spent several years, managing the capital of others with a sturdy honesty and good sense which carried the house safe through the panic of 1855, and established for himself the reputation of a safe and conservative man of affairs, who kept his personal interests strictly subordinate to the trusts which were put in his hands. The period of financial depression culminated in 1857, and Sherman, oblivious of himself, advised the capitalists with whom he was associated to close a business which seemed to have risks disproportioned to any profits which could be realized without rash speculation.

Thrown again upon his own resources, a year or two was spent in tentative efforts to open a new professional or business career, and in 1859 he was invited to become Superintendent of a State Military Academy established in Louisiana. He accepted the position, full of faith that the threats of civil war which were already rife at the South would amount to nothing, and that a congenial career was opening to him. Less than two years brought home to him a second time the severest test of principle. Would he give up his support and that of his young family—would he abandon what he had hoped would be a pleasant life-work—as a matter of patriotic duty? As soon as it became evident that Louisiana would secede, he resigned his place and returned home.

At this time he seems to have refused to believe that war was imminent, and to have had no expectation of resuming his military career. He did not sympathize with the anti-slavery movement in the North. John Sherman's identification with the Republican party as one of its leaders was not pleasant to him, and he used strong language about the "politicians" who were, as he thought, needlessly destroying the Union. When the South began active war by the attack on Fort Sumter, he expressed a willingness to reënter the regular army, but thought his duty to his wife and children forbade his entering the volunteer service for only three months, the extent of Lincoln's first call for troops. He tried the superintendence of a street-railway company in St. Louis, as a stop-gap and breadwinner for the moment, but tendered his military service to the Government when the call for three years' men was issued. He was appointed Colonel of the Thirteenth Infantry, regular army, on May 14, 1861, and immediately went to Washington, where he was put upon inspection duty with the new volunteer army collecting there, while his subordinates in the regiment were recruiting and organizing it in different parts of the West.

The interval since he had resigned from the army in 1853 had been full of varied experience for him, and at times his outlook had been anything but promising; but he had faced every exigency with manly courage and highest principle, always asking first what was his duty, and putting last the question of his advantage. In the providential education which fits men for a great career, the eight years were of more importance than he dreamed of. He had learned how to turn his hand (and his brain) to almost anything. He had developed self-reliance and patience in adversity. He had broadened his views of the world, and had been freed from the narrowing effect of military routine. He had greatly matured all his ideas and grown large in moral courage and in will. In short, he was fitted for command.

He commanded a brigade in the first battle of Bull Run, and in the turmoil of the retreat to Washington saw how much was to be done to make an army out of the noble but untrained material which flocked to the standard. Very soon Gen. Robert Anderson asked for him to assist in the organization in Kentucky of the Army of the Ohio, and he was sent West with the grade of Brigadier-General. When Anderson's health failed, he succeeded to the department command, and his energetic representations as to what must be done in the West to carry on the war successfully seemed so extravagant to Cameron, the Secretary of War, that Sherman was pushed aside as unpractical and harebrained. In truth, he was so devoured by his ideas of the importance of the task the nation had undertaken, and of the absolute necessity of success in it, that his ardent temperament might well make his words like those of a man possessed. Here, at least, was a regular-army officer who was dead in earnest in pushing every resource of the country to the utmost to match the terrible energy the South was showing. He would have despised himself if he could have been capable of sitting down quietly to the routine of a department command, or of simply obeying orders, without trying to stimulate those above him to rise to his high conception of the needs of the time and of the only road to success.

Reduced to a subordinate position, he did not sulk. He still tried to do more than was required in his post, and to volunteer aid from his surplus energy to help others without jealousy or self-seeking. Thus he organized troops at Paducah to be sent up the Tennessee River to Grant, though they passed from his command and he had to go on organizing new brigades from the raw recruits coming in. He did not hesitate a moment to take a division to Pittsburgh Landing, and thus his connection with Gen. Grant began. It would be hard to overestimate the action and reaction of these two men upon each other. Each supplemented the other, each appreciated the things in the other which he himself lacked. Each seemed at his best when cooperating with the other. From that time Sherman's history is the history of the war in the Gulf States—too long a story for such a notice as this, but one in which his courage and his patience, his energy and his self-command, his invention and his practical skill, his enterprise and his subordination, all and each were elements in a great and continuous success which never elated him, but seemed to make his judgment and his conduct ever safer and surer till final victory came, and the world was in doubt whether he or his great chief had the larger part in it.

Sherman's patriotism was as true in 1861 as it was four years later, but it was different in kind. He began the war under the sense of solemn duty to uphold the Constitution and the Union by fighting for the flag. He had been trained in the school of which his distinguished father-in-law, Thomas Ewing, was a leader. He disliked slavery, and wished to see it die out by the progress of enlightened civilization, but he could endure it and live in a society where it existed. He advocated immediate amelioration of the slave's condition and his education; but he thought the men were fools who advocated immediate abolition. He would have carried out Clay's compromises and waited for the progress of mankind to solve the rest of the problem.

The war taught him that peace could only come with universal emancipation; yet even in April, 1865, he was willing to accept the practical certainty of this, and not to insist upon its formal acknowledgment by the South. He thought it a fact accomplished by Lincoln's proclamation, and was not averse to smoothing the way to restored national relations by letting this be tacitly recognized in the final surrender. When once the war was over, however, he advocated everything which could be fairly considered the logical consequence of the victory, and was one of the rare instances of men who become less conservative as they grow older.

He persistently refused to be a candidate for the Presidency when it was notorious that he had but to say the word and he would be the nominee of the Republican party. It is possible that in this he was influenced by his brotherly wish that Senator Sherman should have the political honors, as he himself had the military ones; but he was consistent in it, for he always maintained that Grant's leaving the army to be made President was the great error of his life. The force of association made him more a party man in his later years than his earlier, but no one can doubt the quenchless fire of his patriotism, and his absolute devotion to what he regarded as the good of his whole country.

His outspoken frankness was a very striking trait of his character. It was not always bluntness in the common meaning of that term. It was rather the complete unreserve of one who was willing to have you see into his inmost soul, and who was incapable of a pretence. With this was a genial courtesy which was often very taking in his intercourse with men, and peculiarly so with women. His memoirs are one of the most noteworthy examples of self-revealing in the whole range of autobiography. Those who were nearest to him in his career know best how absolutely truthful is his story of his life, his motives, his judgments, his ambitions. He held it to be part of his duty to truth and to the development of military science that he should not withhold his unfavorable judgment when he had so judged, nor gloze over the rough passages of military experience by a general varnish of praise. He acknowledged his liability to error, and said he should be as glad as any other to have his errors corrected. His opening the appendix of his second edition to those who might think he had wronged them, was an unexampled thing of its kind.

As an officer in the field, his loyalty to his superiors was always transparent. He would urge his opinions; he would boldly use such discretion as was given him; he would suggest plans; but when the proper authority, military or civil, had spoken, he did what was ordered with as faithful a zeal as if he were carrying out his own ideas. His criticisms were always in the interest of the common purpose, never selfish. He gave the full power of his brain to helping perfect the plan, and neither gave nor took offence in doing so. When success was reached by different means from those he had

advised, as in Grant's investment of Vicksburg, his hearty recognition of it was not diminished by a jealous word or thought.

He was never a martinet. He says himself that he was not in good "form" enough to be an officer of cadets, and remained in the ranks. He knew that in military matters form is apt to overtop substance. He wanted everything to be subordinate to the end. If pipe-clay, knapsacks, and leather stocks made the soldier march or fight less energetically, he wanted black belts, loose blouses, and blankets across the shoulder; and so with tactics. Simplicity of movement, few manœuvres, speed in getting to the proper position, and good fighting shape when there, these were in his eyes the important thing, and all the world has come to his opinion.

The two or three great captains in any age are alike in the supreme qualities which make a general. They have the unruffled presence of mind which makes their intellectual operations most sure and true in the greatest and most sudden peril, and the true greatness which makes the most momentous decision and unhesitating action under vast responsibility as if these were the every-day work of their lives. The present generation has in our army seen two such, Grant and Sherman. It is doubtful if it has seen a third. A number of brilliant names of the second order might have developed into the highest rank, but none can fully claim it who has not handled a hundred thousand men in an independent campaign.

It remains only to add that Gen. Sherman was better loved the better he was known. His subordinates who gave him zealous service have no sores or scars caused by his rule. He could command without being arrogant. He weighed all good reasons, he listened to all reasonable complaints. He was a good comrade and a loyal friend who made no pretence of superiority, but who knew when and how to give the word of command. The country has lost a great and pure character and a great patriot, and will find him greater as the seasons pass over his grave.

SARDOU'S "THERMIDOR."

PARIS, February 4, 1891.

THE representation of "Thermidor," the new drama of Sardou's, has assumed the character of a political event. The first representation was very quiet; it took place before the usual public of the *premières*, composed of literary men, critics, journalists, actors, actresses, with an addition of people of fashion who value a *première* as they would any other kind of entertainment. This collection, or selection, if you choose, goes in the newspapers under the name of "Tout Paris." "Tout Paris" is a difficult public, intelligent, blasé, thoroughly familiar with all theatrical tricks, with what we call the *ficelles*. It may be compared to an habitual novel-reader, who can tell you at the first page how it will end at the last. The general public does not always ratify the judgment of the public of the *premières*, but it is always more or less influenced by the opinions of the press, especially as there are at the present moment as many as three theatrical critics of great and well-deserved reputation.

"Thermidor" was well received the first night, but the best judges prophesied that it would not have a long and permanent success. The plot is taken almost entirely out of a novel by M. Claretie, the present Director of the Comédie-Française. The principal character is an actor of the Comédie, called Labussière, who tried during the Terror to save many people from the scaffold, having found a temporary occupation among the people who prepared the accusatory documents for the too famous Revolutionary Tribunal. The part of Labussière was played, and admirably played, by Coquelin. Of course there is a lover, and his love is a victim of the Terror; she is a nun, who, having fallen in love, is ready to renounce her vows and to marry her lover. She has been thrown by the Revolution out of her convent; she is in prison, and she is on the point of appearing before the terrible Tribunal. How can she be saved? The whole drama turns upon this point.

Labussière and the lover are friends (the lover was played by Marais, who makes his début at the Français after having acquired some reputation at the theatres of the boulevard); they discuss the situation; the two great scenes of the drama are inspired by it. First comes what is already called *la scène des dossiers* (the French call "dossier" the collection of written documents which are produced before the Court and analyzed by the defence as well as by the prosecution). If the nun's dossier, such as it is, is produced, she is lost. Labussière has many dossiers pass through his hands; perhaps he could substitute one for another, and our nun would then be saved. Yes, but an innocent woman would take her place on the guillotine. No, not even to save his love from death will our noble and generous lover commit such an action. This scene was played with great simplicity, and it produced a great effect.

There is another way of saving our heroine (her part was in good hands, in the hands of Mlle. Bartet): any woman condemned to capital punishment may gain time if she declares herself pregnant; and if time is gained, perhaps the odious rule of Robespierre will come to an end before the execution takes place. Here comes the second great scene of the drama. When the heroine, who has been tried and condemned, hears of this resource, the nun revolts, all her instincts of chastity rebel within her; she will rather die than tell a lie—and such a lie! If she has renounced her vows, she will not renounce her virtue. She leaves the stage to ascend the scaffold. The scene is fine, but it is extremely painful.

A voice was heard amid all the applause at the end of the play—"A l'Ambigu!" This was not a bad criticism of the piece, which is really more a melodrama than a tragedy. Sardou likes to fill the stage with people. He is a great collector of engravings and costumes, and for a whole evening the stage of the French Theatre really resembled the Paris of the Terror, with its red-caps, pikes, and jailers. The movement and animation of these scenes was something a little new at the French Theatre; the number of actors and of *figurants* was exceptional. Sardou delights in these gregarious exhibitions; we have had them in "Patrie," in "La Haine," not to speak of such plays as "Theodora" and "Cleopatra"; at the Théâtre-Français we expect something of a more literary character.

Sardou's name is so popular that, immediately after the first representation, the boxes and stalls were taken at the theatre for I do not know how many representations. The Radical papers, *La Bataille* and *Le Radical*, had, however, made a protest against "Thermidor." When their editors and contributors were seen, with some of their friends (they were not more than twenty-five in all), in the theatre before the curtain rose on the night of the second representation, it was felt that something was going to happen. They had all brought whistles, and Boileau said of the right of whistling:

"C'est un droit qu'à la porte on achète en entrant."

The noise began during the first act, when Coquelin begins his long tirade against the Terror (I will say here that there are too many tirades in the piece). Some whistles were heard in the boxes of the third tier; the public protested, but in vain. A few whistles can make any representation impossible. Coquelin became very nervous; his voice is like a trumpet. The first act was ended with some difficulty.

The second act is very peaceable, and offered few opportunities to the friends of Robespierre who were in the room. It was not so in the third act, in which is the great *scène des dossiers*, with much declamation against the guillotine. At the moment when Jean Coquelin (the son of Coquelin, a young man who gives some promise of resembling his father) begins his account of a sitting of the Convention and of the struggle between Robespierre and Tallien, the whistles began their work. The most ardent interrupter was a Communist named Lissagaray, now editor of the *Bataille*. He rose, screamed, and delivered a discourse, which was not heard, and finally, in his fury, threw his whistle in the direction of Coquelin, the father. Coquelin quietly took the little copper instrument and put it in his pocket. The editor of the *Bataille* was not satisfied with this first act of violence; he took some sous from his pocket, and threw them on the stage. Marais, one of the actors, put one in his pocket, and said: "This is a *souvenir de Bataille*," alluding to the paper edited by M. Lissagaray. These scandalous scenes did not hinder the actors from playing to the end, and the curtain fell amid the enthusiastic applause of the immense majority of auditors. One of my friends heard some one scream at the door of the theatre, when the spectators were going away, "Vive la Commune!"

The emotion was great when the news of these disorders spread over Paris. The next morning, at the Cabinet council, the Ministers discussed the subject. The French Theatre receives a large subsidy from the State; the manuscript of "Thermidor" had been submitted to the censors appointed by the Government, and had been passed by them without any difficulty. The Minister of Public Instruction, M. Bourgeois, who has the theatres in his department, allowed the piece to be played. M. Claretie, the Director of the French Theatre, is a Republican of long standing. Nobody had expected such a manifestation as had taken place. Sardou himself had declared to everybody that his play was republican in its tendencies; that he attacked the Terror and the men of the Terror, but defended the great principles of the French Revolution.

Nevertheless, the Cabinet decided that the representations of "Thermidor" could not be continued; and, in fact, the third representation, announced for the same evening, did not take place. An interpellation was immediately announced in the Chamber, and it took place on Thursday, the 29th of January. The step resorted to by the Government was attacked, not by the members of the Opposition, but by Republicans who always vote with the Government. They spoke in the name of the liberty of literature and of historical criticism; they drew the line, between the Terror and the Revolution, which M. Sardou had drawn himself. It was said before the sitting that the Ministers were divided, and that a ministerial crisis was to be feared. But it soon ap-

peared that there would be no such crisis; the Prime Minister, M. de Freycinet (who, curiously enough, has just become a colleague of M. Sardou in the French Academy), and the Home Minister, M. Constans, did not examine the question in its details; they simply said that their mission was to secure public order; that public order was threatened by manifestations in the French Theatre, and that they secured it by stopping the representations of "Thermidor."

The great event of the discussion was a cutting speech of M. Clémenceau, the leader of the Extreme Left. He said that the French Revolution was a "block" from which nothing could be detached; they must take it whole or reject it altogether. Pointing to the Right, he said that the sons were as divided as the fathers, and that this division would continue until one of the parties had completely extinguished the other. If the Government did not do its duty, he declared that the *citizens* would—meaning by the citizens, probably, the Communists of Paris. The Government did not endorse these views, yet appeared to act at the dictation of the revolutionary leader, and so did the Chamber, which ratified by its vote the action of the Government. The representations of "Thermidor" have thus assumed a political importance. Since the downfall of Boulanger, the Government has seemed to be as strong as possible: it could very well dispense with the dangerous support of M. Clémenceau. In this circumstance it has astonished its friends as much as his enemies. M. Constans had shown some of the qualities of the man of action; he was the man of the day; the country expected much of him. Is the country to be disappointed in him, as it has been in all the men who have had their hour of popularity for twenty years? Has M. Constans acted as he has done simply because the star of Jules Ferry seems to rise again on the horizon? Or is he simply convinced that republican *concentration* is a necessity of the times?

CHARLES BRADLAUGH.

LONDON, February 7, 1891.

LAST Tuesday: a leaden, chilly sky; a London railway terminus, the platform thronged with a subdued crowd of chiefly middle-aged persons of the working class. Many had evidently travelled far. The attendants in the refreshment rooms had their hands full. There was a fair sprinkling of women. Personal beauty or grace was almost absent. I can imagine how those imbued with æsthetic ideals would despise such a crowd. But, beneath all, were apparent strength and earnestness of character, self-poise, self-reliance—essentially the qualities which have made England what she is. There were no signs of mourning except where upon a seat were being collected a number of funeral wreaths, which, formed principally of white flowers, looked more bridal than funereal. Here and there were worn rosettes of white and violet ribbons, or white, violet, and green. That dull day, that huge, grimy terminus, that quiet, artistically unlovely crowd, might be taken as typical of much that characterizes our modern civilization. How opposed was the scene to usual political associations with the death and funeral of a great man! Yet it was to do honor to a great man, Charles Bradlaugh, that this assemblage met.

One special train had been announced; another and yet another were necessary before the platform was cleared. There was no hurry or confusion; all was conducted in good order. That some 2,000 individuals, men and women of the class indicated, should thus come together, prepared to sacrifice a working day, pay a minimum of half-a-dollar, and travel fifty miles, struck me as about the most sincere tribute I had ever seen rendered to the memory of any man, and this was one who had died very poor, in lodgings, who never held office, and who never wrote a line or spoke a sentence likely to live. We were an hour without stops in reaching Woking. How long it takes, even at the highest railway speed, to emerge from interminable London, and then from its interminable surroundings of streets and terraces in course of erection, and finally from its outlying zone of market gardens! As we came out on the sandy, heath-covered, pine-dotted downs of Surrey, we were conscious of drawing a freer breath. For the first time after weeks we inhaled pure air and viewed a clear country horizon. Wonderful indeed is the magnetic power of London, which, having once drawn men from fresh, free nature within the spheres of its own influences, despite all drawbacks, so generally retains its hold on them.

Past the town of Woking, which has all the appearance of rising rapidly into importance as a country resort, past its great convict establishment on the crest of a hill, we emerge again upon the wide sandy rolling downs, and reach one of the chief burying-places of London. A great improvement it is upon the old crowded graveyards of former years, but far behind American ideas of beauty and arrangement connected with cemeteries. There we alighted, and the wagon carrying the coffin was drawn by an engine up the line, and then down a siding to the receiving-platform under the little church at the entrance of the cemetery. The air was fragrant with the odor of the thyme under our feet. The crowd, gathered in a vast circle round the open grave, appeared more picturesque than at the railway station. The uniforms of several soldiers were conspicuous, and the bronzed faces of many of our Indian fellow-subjects. It would have been interesting to know the name of many an undistinguished-looking man. Some would doubtless have carried us back to Chartist times, the fall of Hyde Park railings, and the various successive struggles by which in our time British liberty has been more and more asserted and secured. Mr. Holyoake was one of the most interesting personalities there; John Morley the most noticeable among the Parliamentary colleagues of the deceased. There were tears on several plain, stern faces. The simple black coffin was borne in on men's shoulders and committed without ceremony to a deep grave in the sweet sandy soil. All was then over. Unnecessary lingering was undesirable in the chilling blast that swept over the country, and we were glad to crowd into the trains and return to town.

I knew little of Mr. Bradlaugh until I sat beside him in the House of Commons. My dominant feeling in connection with his name was shame that our Irish members had taken such an unworthy part together with the illiberal majority which for so long did their utmost to exclude him from Parliament. The more I saw of him, the more I admired and respected him, the more profoundly I was impressed by his largeness of nature and his conscientious dedication of his great powers to the side of right and truth on every question that came before us for discussion. His whole demeanor was marked by intensity and directness. He was seldom seen in the library or reading-rooms, or chatting in the lobby. His only relaxation, apparently, was chess in the smoking-room. He had thoroughly mastered the forms and rules of the House, and his abilities enabled him to make the best use of his knowledge. To the people of India and to all subject races under British rule, he is a supreme loss. At the grave-side a Parsee remarked to me that perhaps no Englishman was ever so sincerely regretted by a larger number of his fellow-subjects. Every trick and artifice had been tried to keep him out of the House. He had been dragged by police from the table and thrown exhausted and with torn habiliments into Palace Yard. Once conceded his rights, he was as jealous as any member could be of the respect due to the Chair, of the dignity of the House, and of all its forms and usages. He seemed incapable of pettiness or meanness. In nothing did he more show his magnanimity than in his steady adherence to the cause of Ireland, after the part her representatives had taken against him. I recall his wonderful voice, ringing like a clarion through the House, his commanding figure, clad in sombre black, the towering forehead, the white hair brushed back. The little "Exit" sketch of him in *Punch* this week is pathetic in its truthfulness; the artist has fully caught the impression given by his figure of his character.

No member was listened to with greater respect or had more completely captured the ear of the House. "I used to hate that man," said a good Catholic to me; "but as I sat beside him I could not but grow to like him." It was hardly a face to inspire love; there was too much of the bull-dog about it. It was graven with the strife and endurance of a long Ishmael life of poverty and trial. It was the countenance of one who, against overwhelming difficulties, had forced his way to recognition and respect. There was little space left for lines of tenderness, yet the man had an acutely sensitive and loving heart. I am not competent to speak regarding the general effect for good or evil on society of his 'Fruits of Philosophy' and his "atheistic" writings. Such a man need not call himself "atheist." If ever there was a believer in the government of principle and truth, it was he. If he were atheistic as to the ideal God of the world, he cannot have been so as to the God of Christ. His calling himself an atheist was perhaps felt as a challenge by many whose views may have been similar, but who did not feel bound to attempt a definition of their beliefs, positive or negative. Is it not the case that, with a haunting sense that they are perhaps not acting quite straightforwardly, men more and more shrink from such avowals, not so much from cowardice as from humility, and from a profound, growing sense of the difficulties attendant on all attempted definitions of the unknowable? Many whose opinions are entirely vague feel that they would give a false impression if, like Mr. Bradlaugh, they stigmatized themselves as atheists, though they may suppose their doubts run very much on the same lines as his. "Who fathoms the Eternal Thought?" better expresses the feeling of the present seeker after truth than the sharp iconoclasm of the religious questioning that characterized the early days of Mr. Bradlaugh, that characterized the living Winkelried struggle of his life, while he helped to make an easy, honored path for others by receiving into his own bosom the arrows of the prejudiced and of the really atheistic.

Mr. Bradlaugh's natural abilities were of an uncommon order. Buying himself out of the army, and entering an attorney's office as a messenger, within a year he had mastered the intricacies of the common law. He was a born

orator. Earning his living through long, close hours of work, it was often his wont between Saturday night and Monday to travel several hundred miles and lecture thrice to large audiences. Meanwhile he "learned" Latin, Greek, and Hebrew, and as many modern languages as he found occasions for. When he died, he was, of all Englishmen, the best qualified to administer the Government of India. Surely it must lead to the wreck and ruin of many a noble, conscientious nature to point to such a career and say: "With ordinary talents and extraordinary perseverance all things are attainable." Is this not binding intolerable burdens upon human nature? The happiness and usefulness of life depend to a greater extent than we have as yet realized upon a correct estimate of individual powers—upon the essential difference between the capacities of ordinary men and women and those of Charles Bradlaugh. D. B.

THE POPE AND THE FRENCH REPUBLIC.

ROME, January 20, 1891.

THE position of the Pope, and the possible influence he may have on the affairs of Europe, though perhaps not so important as is believed at the Vatican, is of serious weight in the contingency of a general conflict of the Powers. The pent-up antagonism between him and the Italian Government has always been, like the sack of winds which Æolus gave to Ulysses, a danger to both if some imprudent partisan or resolution of the Sacred College should let it loose. When the Italian Government took possession of Rome, it was, as your readers probably remember, in violation of an agreement with the Emperor of France by which the position of the Pope was to be respected—the meaning being evidently that the temporal sovereignty should be maintained. It was impossible not to enter Rome after the fall of the Emperor and the total defeat of France unless the King was willing to risk a revolution. There are circumstances which are stronger than any treaty or resolutions, and if the royal troops had not taken Rome, the Garibaldians would have done so, and nobody knows what might have happened. The Law of Guarantees passed by the Government on taking possession gives the Pope a civil list of three and a quarter millions of francs and invests him with diplomatic immunities, the power of sending and receiving ambassadors, having his own posts and telegraphs, and communicating without interference with foreign Powers, and puts the Vatican and all its surroundings and the palace of the Lateran, with the Papal villa at Castel Gandolfo, under his guardianship, without tax or impost; holding, however, to the inherent national sovereignty over the whole. Exterritorialized by Italian concession, it is capable of being reclaimed by an exercise of the same will. The Pope, as was to be apprehended, refused to accept a limited sovereignty, declines the endowment, and refuses to recognize the possession of Rome by Italy. This is the normal position. The Pope, standing on the principle that, as head of the Church, he cannot be subject of any earthly sovereign, maintains that he must be placed in a position of political independence; while the Italians maintain that the whole of Italy belongs to the Italian people, and that the national will is sovereign.

All the appeals to the Powers to oblige the Italian Government to respect the Papal independence, *i. e.*, the temporal power, have been responded to by the statement that they regard the question as one of the internal politics of Italy, in which they have no right to interfere, with the exception of France, which does not disclaim a right of interference based on the treaty stipulating for the independence of the Holy See; and it is well understood that this intervention is the sword of Damocles over the head of Italy, and that the hope of the Vatican is in the compulsion of France, for the Italians will never submit to the separation of Rome from Italy, or the return of the temporal power over it except as the consequence of military defeat, *i. e.*, irresistible compulsion. The consequences of such an eventuality on the future of the Church in Italy and the position of the Papacy may be left to those who choose to prophesy and have the gift, for I can only conjecture. The present situation is enough for an uninspired journalist. As respects political independence, the Pope is as dependent on France for what he would have, as he now is for what he has on Italy. He escapes from Scylla to fall into Charybdis, and the latter is really much the greater slavery of the two, for a French garrison in Rome means an absolute political subserviency to France, while with Italy entire freedom of action and motion is secured on condition that the Vatican abstains from politics.

What the subserviency to France means is now made clear by two questions which have arisen between that country and the Vatican. The first was on the appointment of the new Bishop of Strassburg, for which place the French Government urged the appointment of an Alsatian, while the German insisted on that of a German, as was to be expected; and the result was equally to have been expected, for the Pope has as large an interest at stake in Germany as in France, with the additional consideration that if the nomination did not suit the German Government, the exequatur would be refused. What motive could have induced the Republic to enter on such a contest when the game was in the hands of the Germans, and sure to be won by them, I do not see. But the Vatican has had to admit, and the Republic to learn, that though the latter is the only friend the former has, the friendship is not enough to induce the Pope to resist the demands of the German Government when the pressure is urgent on both sides. Monseigneur Fritzen, the candidate of the Emperor, has been appointed. I am told that the irritation at Paris is very great, and one can readily conceive this, for the influence of the Bishop must be of immense weight in the direction of public opinion in the contested questions of loyalty which will continually arise; but that the French Ministry should conceive that it could prevail on the Pope to nominate a Bishop whom it had proposed, against the certain opposition of the Emperor, indicates that it had a high opinion of its own influence at the Vatican.

The other question is one which has a much larger scope and which offers the possibility of much more serious results. It is that of the recognition of the Republic by the Vatican in such form as to detach the clergy from the Royalist and Imperial parties. The advanced position taken by Cardinal Lavigerie, echoed by one of the bishops, was taken as a demonstration by the Vatican of the abandonment of the monarchical pretenders and a conversion to the Republic; but

> "If the red slayer think he slays,
> Or if the slain think he is slain,
> They know not well the subtle ways
> I keep, and pass, and turn again";

and the Republic is now probably realizing that, though the Pope may accept a republican government where it exists uncontested, as in the United States of America, and live in peace with it, the conditions of political organization in France are such that he cannot identify himself with them. Their logical consequence in Italy is the abolition of his political existence, the right of revolution being opposed to the divine right on which his claims rest, while the durability of the Republic is not so certain that he can for *les beaux yeux* of the last of the heathen mythical creations afford to quarrel with his only true and devoted partisans in France, the Royalists, the only Frenchmen who still hold to the principle on which the Papacy is founded; the more so as, in the mutations which lie in the future, they may find that the royalty is not slain, but may "keep, and pass, and turn again."

The result of the venture of Lavigerie was that Cardinal Rampolla, Papal Secretary of State, *malgré lui* had to send out a circular in which he seemed to approve the language of Lavigerie, but the real meaning of which was that the Vatican accepted the Republic because it existed; that though very friendly to that particular republic, it declined to undertake any propaganda for it; and that Lavigerie was quietly disavowed wherever it was necessary, and other bishops made to understand that the Vatican did not care to follow in that way. The apostle of the anti-slavery crusade was left out in the cold, and has become an impossible Cardinal, so far as future advancement goes and while the present system endures. "They know not well the subtle ways," nor did they understand the mighty immobility of the Church. Somebody had to be punished; the Pope and cardinals were out of reach, and so the Abbé Puyol was dismissed, being the person of all whom the French Government could reach who was nearest and personally dearest to the Pope. The Abbé Puyol was the head of a French religious community in Rome and curé of the national church St. Louis des Français. The Pope had sent him, according to one version, but he had volunteered according to another, to settle a difference between some parish priests who had incurred the anger of the Government of the Republic by either using their influence for the wrong candidate or not using it for the right one—for it is not easy to get at the exact truth of the matter—and had been dismissed, suspended, or otherwise punished and had demanded reparation of the law. The Abbé conveyed to them the desire of the Pope that they should abandon the litigation, which they did, and the Abbé then obtained at his own suggestion, or conveyed at that of the Pope, some ecclesiastical honors (chamberlainships or similar), to express the satisfaction of his Holiness at their docility. This happened some time ago, and one would have thought, if worthy such a severe punishment as the cutting short of the Abbé's ecclesiastical career, should have been visited at once. The fact that it was only discovered to be so grave an offence after the other differences had come to a head, is confirmation strong enough of the feeling at the Vatican that the blow was intended by prosopopeia for the Pope.

I hear from one of the Monsignori of my acquaintance that the indignation in ecclesiastical quarters is very intense, not merely at this, but at the general pressure put on the French clergy to favor the Republic. The Monsignori say that it was direct and even brutal pressure to take an active part in the elections in favor of the Republic, and the friends of the Government say that all it wants is their complete abstinence from any mixture in politics. It does not seem possible that the purely negative policy of the latter version could develop the bitter feeling which

I have had evidence of on the part of the churchmen. One thing is certain: the cordiality between the Republic and the Vatican is very far from what it used to be and must be, to have much political result in favor of the present Government. The impression seems to be that the Republic is not so solid as is assumed by the republicans, and, considering the power the clergy have over the votes of the peasants, the anxiety to secure their cordial support is very natural and justifiable. But if the Pope were determined to assert his independence and direct the influence of the Church in favor of the Royalists, or, feeling himself abandoned by France, to initiate a crusade in favor of peace and disarmament according to the principles of Christianity, or finally, finding all hope of a restoration of the temporal power gone, should reconcile himself to the kingdom of Italy, the effect of his power over European politics might be to change the aspect of affairs. This again is speculation; what is certain is that there is a serious breach between the Pope and the Republic. X.

Correspondence.

FORMS OF EXECUTIVE POWER.

To the Editor of The Nation:

Sir: The Boston *Transcript* has a letter from Mr. E. A. Freeman deprecating a rumored change in the Swiss Constitution so as to make the Federal Executive Council elective by the people, instead of by the Federal Assembly, and instituting a comparison which it is interesting to follow.

(1.) The Federal Council is chosen for three years as its first act by the Federal Assembly elected for the same period, and the Council chooses each year as its President one member, who represents them on state occasions but has no special power. The Council is irremovable, and lasts as long as the Assembly. The members of the Council cannot be members of the Assembly—that is, they cannot vote in it; but they can attend meetings and can speak in either house at pleasure.

(2.) The French President is elected by both houses in joint session for a period of seven years, and is irremovable except by impeachment. He has no seat and no voice in either house, and in fact the Legislature pays little or no attention to him, but sets up and pulls down ministries, at the pleasure of a fluctuating majority, on the same principle as, but with much greater instability than, the British Parliament.

(3.) In Great Britain the Prime Minister is nominally appointed by the Queen, but is practically the choice of the majority of the House of Commons. The rest of the Cabinet are voluntary associates whom the Prime Minister persuades to serve, with the understanding that he will support them—that is, will resign if any one of them is defeated. The first and most absorbing occupation, therefore, of the British Ministry is to keep its footing.

(4.) The Italian Ministry is substantially on the same footing as the British.

(5.) The United States method, though coming nearest to the Swiss, differs entirely from the others. A single President is elected by the nation, and selects his Cabinet, which the Senate seldom or never refuses to confirm. The one objection which all foreign critics, including Mr. Freeman, make to our system, is, that the Cabinet have neither seat nor voice in the Legislature, which, as well as the country, is thus deprived of this guidance, which is almost indispensable for either successful legislation or administration. But these critics treat this as if it were a necessary part of our system, which it is not at all. Why could not our Cabinet, without being members of the Legislature—that is, having no vote—have seats and a voice there just as much as the Federal Council? Why, being the choice of the President for a fixed term, need they resign upon an adverse vote any more than the Federal Council? Mr. Freeman says that as the President and the Cabinet often belong to a different party from the majority in Congress, the two would quarrel. But the Swiss Assembly must be more or less than human if, in the course of three years, they do not find grounds of quarrel with the Council, even though elected by them; and it would be perfectly easy, even if they are irremovable, to make their positions insupportable. For whatever reason, this does not happen. Congress would be exceedingly wary of quarrelling with our President, because the popular sympathy would always be with him, and any appearance of factious opposition would touch the Congressman in his tenderest point—fear for his seat.

The Swiss method of an Executive Council without official head is undoubtedly on a wrong principle, and why it works as well as it does can only be explained by the smallness of the territory and the character of the people. If it came to be made up by a popular election, its weakness would probably soon be made apparent. Our method of electing a single President by the whole people is one of the strongest working arrangements in the world. To show how strong it is, an experiment, one of the most interesting in the history of politics—that of giving the Cabinet seats and a voice in Congress—could be made with the greatest ease, and discontinued if unsatisfactory. The obstacle consists in the preponderance of private interests, the rule of the lobby, the jealousy of the committee system and of the party machinery. The only interest to be benefited would be that of the people at large and of the whole nation, which, as everybody knows, is now of little account. But if some President, or even some Cabinet officer, ever has the courage to appeal from Congress directly to the people, he may find that that interest has still something to say for itself. G. B.

Boston, February 7, 1891.

ANOTHER EFFECT OF HIGH TARIFFS?

To the Editor of The Nation:

Sir: Will you allow me to call the attention of American manufacturers, sending goods to a foreign market, to the fact that, when directions or warnings are necessary to the proper use of such goods, the language of the foreign market should be employed? The same regulation applies also to advertisements, if it is expected that any advantage will be derived from them.

To use the foreign language would be so evidently in the interest of the manufacturer or shipper that it is surprising that this caution is necessary; yet Americans living abroad have often occasion to notice this want of forethought.

As particularly erring in this respect should be noted a well-known brand of canned corned-beef, each can of which has printed upon it, in Engli h, a warning to the effect that the meat should not be allowed to remain in the can after it is once opened. If any dangerous results are to be feared from disobedience to this direction, it should surely be printed in a language to be understood by the buyer. Here, in Germany, this American canned corned beef can be seen for sale in every provision store; it is the custom of the dealer to sell the meat by the slice, from a five or ten-pound can, using the can in the meantime as a convenient receptacle for the meat until all is sold. As neither German buyer nor seller can read the English warning against this practice, the moral responsibility for any accident arising therefrom must fall upon the American seller.

I have often also seen children's toys and games, of American make, offered for sale in Germany with only English explanations, thus almost precluding their sale. Also those peculiarly American labor-saving articles, patent sweepers, ice-cream freezers, apple-parers, etc., are sometimes rendered ineffectual through their improper use, which too often arises from a lack of a proper explanation in a language comprehensible by the user.

H. C. P.

Dresden, Germany, January 22, 1891.

"F. H." AND THE LETTER *H*.

To the Editor of The Nation:

Sir: If Professor Hart, by his reflections on me in your columns, has realized his obvious aim, he has determined my level, as a philological inquirer, to be that of an underflogged schoolboy. The reasons I am about to give for declining to accept the rank which has, by implication, been assigned me, will, I apprehend, be acknowledged as valid.

Some time in the course of the last century, possibly not long before or after the middle of it, there arose, in England, among the uneducated, a habit of freely dropping the initial aspirate of words to which it belongs, and of prefixing the aspirate to words beginning with vowels. On this habit, which grew, by degrees, to be epidemic over a good part of the land, I made a few remarks in No. 1330 of your journal. And in those remarks I kept strictly to my subject.

But there is another subject, one in no wise connected therewith, which Prof. Hart chooses to think that I should have considered simultaneously; and, because I left it untouched, I am forthwith loftily taxed with nothing less than the rawest sciolism of a certificated dunce.

The particular phase of sciolism in question indeed involves, for instance, unacquaintance with the Biblical *emerods* and Shakespeare's *Ebrew;* forms on which I find, among my papers, a note taken as far back as 1838.

This statement, indicative of my early interest in philology, counts for nothing, I am well aware, in rebuttal of Prof. Hart's gratuitous assumption. But very different is the fact that I am able to quote, as follows, what I incidentally put in print eighteen years ago:

"For several centuries, the rights of *h* were far from being rigidly defined; and old authors often have *hable*, *habundance*, *hangle*, *happle*, *hearl*, *helder*, *hoak*, *howlet*, *husance*, etc., with *abit*, *emisphere*, *emorrhoids*, *ierarch*, *oly*, *ymn*, *ypocrite*, *yssop*, etc. In the thirteenth, fourteenth, and fifteenth centuries, as I could show from Roberd of Gloucester, William of Palerne, Capgrave, and a host of other authorities, *his*, the pronoun, was corrupted into *is*. I shall make use, a little farther on, of the fact here shown, namely, that the initial *h* was once prefixed, or omitted, with great carelessness."—*Modern English* (1873), p. 358.

Your obedient servant, F. H.

Marlesford, England, January 23, 1891.

Notes.

Houghton, Mifflin & Co.'s spring announcements include a revised edition of 'Poole's In-

dex to Periodical Literature'; 'The Sisters' Tragedy, with Other Poems, Lyrical and Dramatic,' by T. B. Aldrich; 'A Sappho of Green Springs,' a new volume of stories by Bret Harte; some thirty discourses by the Rev. A. P. Peabody, entitled 'King's Chapel Sermons'; 'As It Is in Heaven,' reflections on the future life, by Lucy Larcom; 'The Epic of the Inner Life,' studies in the Book of Job, by Prof. J. F. Genung of Amherst; and 'Japanese Girls and Women,' by Miss Alice M. Bacon.

Macmillan & Co. make the very interesting announcement that they will shortly publish 'The Oxford Movement: Twelve Years, 1833–1845,' by the late Dean Church. This is a volume based upon Dean Church's personal recollections, and will follow the course of the movement from its first public beginning to the secession of Dr. Newman. The "character sketches" of Newman, Keble, Hurrell Froude, Ward, and others that are promised will be eagerly looked for by many. Material for a history of the Oxford movement is now rapidly accumulating, and none is likely to be more valuable than Dean Church's book will be.

N. D. C. Hodges will publish directly 'The Labrador Coast: A Journal of Two Summer Cruises to that Region,' by Prof. Alpheus S. Packard. The work will contain notes on the early discovery of Labrador, its Eskimo inhabitants, physical features, fauna, etc., and a bibliography of works and charts pertaining to the civil and natural history of the peninsula. It will be illustrated.

The American Academy of Political and Social Science will shortly issue a translation, by Dr. R. P. Falkner of the University of Pennsylvania, of Prof. Meitzen's work on 'Statistics.'

The eighth volume of the Messrs. Putnam's edition of the Writings of Washington, edited by Mr. Worthington C. Ford, covers the period August 2, 1779–October 18, 1790, which is somewhat devoid of military interest, though the arrival of Rochambeau and D'Estaing and the treason and flight of Arnold mark the beginning of the end of the war. It seems worth remarking that Washington used, in a letter to Benjamin Harrison of October 25, 1779, a rare word which Dr. Murray, in his New English Dictionary, can trace no further back than 1847. It will be found on p. 94 in a sentence containing this clause: "without doing a single thing *advancive* of the end in view." The 'Century Dictionary' quotes without date, through Bancroft, another but later employment of the same word by Washington. It occurs in a letter to R. H. Lee, dated March 15, 1785: "more *advancive* of individual interest than the public welfare."

With the fourteenth volume, Prof. Masson concludes his admirable editing of 'The Collected Writings of Thomas De Quincey' (Edinburgh: Adam & Charles Black; New York: Macmillan). Naturally we have here a very miscellaneous assortment, some of the pieces having for the first time been detected by Prof. Masson in the magazine to which they were contributed unsigned, and one having never seen the light before, being a MS. appendage to the graduating thesis of De Quincey's son. This last is an answer to the so-called "Religious Objections to the Use of Chloroform"—objections which shed an awful light on the state of the human intellect in 1847. Perhaps the most valuable find of all was the "Recollections of Hannah More," published anonymously after her death in 1833 at a very short interval. She was a friend of his mother, and encouraged a Calvinistic sternness of regimen of which De Quincey got the benefit; and his analysis of Mrs. More's character is harsh enough. Her reputation as an author, he says, "first commenced in a reciprocal intercourse of flattery," and he would not acquit her of worldly-mindedness. Here, too, we have a translation of Kant's no less severe "Abstract of Swedenborgianism," with two other Kantian pieces, swelling the total of De Quincey's exposition of the great philosopher to no mean amount; a comparison of French and English manners; a denunciation of the Free Church movement in Scotland; an argument for the opium war with China, etc. Prof. Masson makes an estimate, in his Epilogue, of De Quincey's literary activity and his probable (very small) earnings as a littérateur almost wholly publishing through the magazines; and provides most scrupulous tables of chronological production and an index. Devotion to a favorite author could hardly further go, or more judiciously.

The "Tudor Library" (London: David Nutt) continues its elegant and beautiful reprints of Elizabethan rarities with the English translation of the first book of Francesco Colonna's strange romance, the 'Hypnerotomachia,' or 'The Strife of Love in a Dream,' as the title runs here. Mr. Andrew Lang furnishes an unsympathetic preface, in which the most he grants is that some of the language might have pleased the "unripe youth of Keats"; but he treats the whole slightingly. The original work is valued for its charming woodcuts, more delightful, *pace* Mr. Lang, than the French reproduction of them, and here poorly represented by some examples copied by a mechanical process from the original Aldine of 1499, with great loss of refinement in the line. The text is a free translation, and represents well enough the curious conglomerate of art and theology, herbs, precious stones, devices, mythology, and erotic imagination which compose this characteristic Renaissance monument. The love of architecture and the lapidary's art, the turn for obscure allegory, and the delight of the author in all wrought objects of beauty, are most conspicuous; but through all the unintelligible maze of description one finds a lover of the beautiful and of the ancient world, so possessed with his love as to represent vividly that intoxication of the sense of beauty which belonged to the Renaissance. It is a book for few readers, but those who have the secret will find pleasure in this profusion of the author's dream; they will not care overmuch for the sense of his words, and they will meet with many brief passages of real poetic charm, set forth in phrases of a mingled sweetness and nobleness of which our language has long lost the art. The edition is limited to 500 copies.

The past year of *Harper's Magazine* is bound up in volumes 80, 81, and the excellent tables of contents enable one to take a bird's-eye view of the editor's feast. Russia stands at the head of foreign countries illustrated, with Landsdell's "Baltic Russia," Vicomte de Vogüé's "Through the Caucasus," Theodore Child's "Russian Art," and a Russian general's account of the Russian Army, as Lord Wolseley describes the standing army of Great Britain and Gen. Wesley Merritt that of the United States. Mr. Child is perhaps the most favored contributor, as he is represented not only by the article just mentioned, but also by one on modern French painters and three on South America—"Across the Andes" and "Chili" (Agricultural, and Urban and Commercial). We recall also Mr. Charles Dudley Warner's paper on Southern California ("Our Italy"), Mr. Laurence Hutton's "American Burlesque," and the Abbey and Lang Shaksperian partnership in the case of the "Merchant of Venice" and the "Merry Wives of Windsor."

The thousand pages of *Harper's Weekly* for 1890 bring to mind with text and engraving such events as the fall of Bismarck, the Pan-American Congress, the rescue of Emin Pasha, the Louisville tornado, the Indian ghost-dances and slaughter, the development of our navy, the centennial of the Supreme Court, the beneficence of Baron Hirsch and Daniel Fayerweather, and many of minor moment. The supplements have supplied a great variety of useful and entertaining monographs, in which descriptions of American cities and of city clubs have been prominent. Mr. Child has had much to tell here also of South America. Mr. Janvier's "Aztec Treasure-House" has been the leading serial in fiction. The portraits in these successive volumes one can but feel to be of the most permanent worth. The obituary and the political series are both very extensive, and the student of physiognomy can draw a swift moral from the latter.

It is difficult to sum up the pictorial aspect of *Harper's Bazar* for the same period. "Actuality" is almost excluded from it, and there is in the cartoons but the faintest intimation of the great happenings in the world without the circle of the modiste. Mr. T. W. Higginson's fortnightly papers to and about women are the best corrective of too close attention to the main object of this fashion periodical.

The publisher of 'Bibliographie générale et raisonée du droit belge,' by Edmond Picard and Ferdinand Larcier (Ve. F. Larcier, Brussels, 22 Rue des Minimes), has done well to print an alphabetical subject-index to that excellent work. Six pages of addenda bring the total number of title entries up to 9,510, and the index swells the number of pages in the book to 1,354. The new title-page which is supplied for the completed volume states the exact period covered by the bibliographical record to be from the time of the separation of Belgium from France, in 1814, to October 1, 1889; and supplements are announced to be published to cover every subsequent five years. The index is furnished without charge to all subscribers to the original work.

The 'Inorganic Chemistry' of William Jago (Longmans) is, on the whole, a fairly good elementary treatise, deserving neither special praise nor blame. The illustrations help to make it a useful school-book. Of a far higher character is the translation, by J. Bishop Tingle, of Prof. E. Hjelt's 'Principles of Organic Chemistry' (same publishers). In the author's words, it is intended for students who have already some general knowledge of organic chemistry and who wish to extend and *systematize* that knowledge. It is precisely in this systematization that the value of this manual consists. Organic chemistry now presents a colossal mass of facts expressed in formulas which can only be understood by reduction to primary forms. Prof. Hjelt's book will materially assist the student in the necessary work of reference and reduction. It is essentially, however, an elementary work.

Our economic degradation and slavishness is renewedly brought to mind by an edition, revised to January 1, 1891, of 'Downing's United States Customs Tariff' (New York: R. F. Downing & Co.). It gives the text of the McKinley Customs Administrative Act and Tariff Act, together with an alphabetical schedule of articles and duties, with references to the paragraphs in the said acts which provide

for them. The latest decisions of the Treasury on this mass of oppression and confusion are embodied in the schedule.

The report of the Massachusetts Board of Health for 1889 deals with some matters of common interest, but the results are not particularly satisfactory. Special reports are made upon intermittent fever and upon the *grippe*, but in neither case is our knowledge of causes much extended. In fact, the returns are too imperfect in the case of "malaria" to justify any wide generalization, although it is evident that fever attributed to this cause is disappearing in places where it formerly prevailed, and is manifesting itself in many new localities in the eastern part of the State. But as it frequently does not appear where it theoretically should, and does appear where it should not, it is evident that there is yet much to be learned about it. A beginning is made in the collection of statistics of the physique of women which, if continued, will furnish some useful data. Much valuable assistance is given by the Board to towns and individuals who propose to engage in the construction of water and sewerage works, and it is evident that this new function satisfies a public want.

The New York Shakespeare Society announces that it ceased, with the issue for January, 1891, to conduct, or to be responsible for, the magazine *Shakespereana*.

In the *Magazine of American History* for February, Mr. H. E. Green, who is engaged in indexing the Pickering MSS. presented to the Massachusetts Historical Society, indicates the range and great value of this collection, and conveys a not to be despised impression of the worth of Timothy Pickering which even a cataloguer must feel. Abstracts of all the letters will be given, he says, with entries under all subjects of any importance.

Mr. Wm. Coolidge Lane of the Harvard University Library publishes in its Bulletin for January an Index of reference lists and special bibliographies included in periodical and other publications of recent date. It is in continuation of a similar Index published in 1888.

Mr. James T. Maffett, formerly member of Congress, is building up at the new State Normal School at Clarion, Pa., a collection of public documents, State and national, which promises to be very large indeed, and perhaps might already claim to be unrivalled. In such matters the rule that unto him that hath shall be given seems eminently fitting; and as there cannot be many collectors having the same ambition with Mr. Maffett, it is safe to wish that he may establish a permanent inflow to his peculiar library of reference.

A number of the leading librarians of the United States have joined in a testimonial to the worth and indispensableness of the Monthly Catalogue of United States Government Publications which has for several years been issued, amid many discouragements, by Mr. J. H. Hickcox at Washington, D. C. Its plan includes the separate entry of every paper or contribution contained in the publications—an immense boon to all who consult it. Strange to say, the Catalogue has not received the full support of the public libraries, and this unique undertaking is in danger of collapse. Such a fate would certainly be a shame to the community, and the publisher does not ask too much in requesting a doubling of present subscriptions and a fresh adhesion on the part of the delinquent. Mr. Hickcox's address is 905 M Street, Washington.

The eighth of the "Old South Leaflets" (Boston) for 1890 is a very interesting collection pertaining to the American Indians. It opens with a discourse by William Henry Harrison, in 1839, on the Mound-builders of the Ohio Valley. Next comes Thomas Morton's account of Indian manners and customs in his 'New English Canaan' (1637), followed by John Eliot's 'Brief Narrative' (1670), William Hubbard's relation of the beginning of King Philip's War in his 'Narrative' (1677), Pontiac's speech (1763) from Parkman, an extract from Black Hawk's autobiography as to the cause of the war bearing his name, Coronado's letter to Mendoza (1540), and Wheelock's narrative concerning his Indian charity-school at Lebanon, Conn.—a choice little assortment, truly, and the whole carefully annotated and illustrated.

Extensive preparations are being made at Munich for the Annual International Art Exhibition of 1891, and invitations to the artists of Germany and other nations have been already issued. This year the whole of the "Glass Palace" will be available for the purposes of the exhibition, so that there will be no lack of space. Applications of artists who wish to be represented should be made as early as possible to the Secretary of the Künstler-Genossenschaft, Briennerstrasse.

—Details of reorganization of the faculties and of the departments are the most important feature of the annual report of President Eliot of Harvard. The question of a three-years in place of a four-years course is left, where the Overseers have placed it, in suspense; but there is some quiet marshalling of data confirming the late average age of entrance to the academic course—nobody now below sixteen, and the average at nineteen; and a circular advising parents not to hold back their sons when prepared for college, is printed as authorized by the Faculty. Gratification is expressed at the manifest tendency to reduce the number of intercollegiate games, "it having been already demonstrated in boating and foot-ball that one intercollegiate match is sufficient to maintain all necessary interest in home practice"; and, adds President Eliot, "the best number of intercollegiate contests is the smallest number which will maintain" this interest. He does not allude to the probable good effects, in this direction, of the proposed shortening of the course. The allowable substitutes for Greek in the entrance examinations are still not largely availed of—by less than 9 per cent. in 1890; and the true explanation is given—"the capacity and taste for mathematics and physical science are much less common than the capacity and taste for languages." In other words, speech, as it was the fundamental distinction between man and the lower animals, remains the most natural. In this connection, readers of the report will note attentively what is said about the effort to improve the gift of expression in English at Harvard—a problem needlessly complicated, as we believe, by the endeavor to cultivate by one and the same exercise the art of clearly stating what a man has to tell, and to force the brain to think. A general prosperity prevailed throughout the University during the past year, happily marked by the raising of professors' salaries; but there is an ominous warning from the Library that its shelf-room is nearly exhausted; and, as our readers are aware, the undergraduates are laboring to raise money for a separate reading-room adequate to the needs of the ever-growing number of students who voluntarily and perforce frequent the Library. "This," says President Eliot, with one exception, "is the most urgent need of the University at this moment."

—The Bureau of Education's Circular of Information, No. 3, 1890, is a bulky pamphlet on 'The Teaching and History of Mathematics in the United States,' by Prof. Florian Cajori of Colorado College. Three-quarters of the 400 pages are given to the history proper, full in facts and decidedly anecdotical, but sadly wanting an index. Some of the stories are rather personal. The following relates to Prof. J. J. Sylvester, who is referred to as "Silly":

"His manner of lecturing was highly rhetorical and elocutionary. When about to enunciate an important or remarkable statement, he would draw himself up till he stood on the very tips of his toes, and in deep tones thunder out his sentences. He preached at us at such times; and not infrequently he wound up by quoting a few lines of poetry to impress on us the importance of what he had been declaring. I remember distinctly an incident that occurred when he was at work on his Universal Algebra. He had jumped to a conclusion which he was unable to prove by logical deduction. He stated this fact to us in the lecture, and then went on: 'GENTLEMEN' [here he raised himself on his toes], 'I am *certain* that my conclusion is correct. I will WAGER a hundred pounds to *one*; yes, I will WAGER my *life* on it.' The capitals indicate when he rose on his toes, and the italics when he rocked back on to his heels. In such bursts as these he always held his hands tightly clenched and close to his side, while his elbows stuck out in the plane of his body, so that his bended arm made an angle of about 140°."

Following this historical matter are twenty-three questions concerning methods of teaching and the like answered in the briefest manner by professors of 168 colleges, with other decisions by teachers in normal schools and others by principals of high schools. All this part of the book is diffuse and ill-edited. Little or no discrimination has been exercised in selecting the institutions; and from many of the most important there are no replies. There are none from Harvard, Yale, Princeton, the University of Pennsylvania, Ann Arbor, Cornell, Clark University, or the University of Wisconsin, all of which seats of learning should have been visited.

—The arrangement of the answers is such as to cover a great deal of paper while affording the reader no facilities; the whole thought, apparently, having been to save trouble to the compiler. As a fair sample of the value of these decisions, we may summarize those which sprawl over the half of three pages in response to the question, "Do scientific or classical students show the greater aptitude for mathematics?" The answers are:

Decidedly, the scientific,	from	41	colleges.
Decidedly, the classical,	"	28	"
Apparently, the scientific,	"	7	"
Apparently, the classical,	"	9	"
Sensibly equal,	"	13	"
Doubtful or nearly equal,	"	14	"

The more expanded statements could easily be put into half-a-dozen lines more. These replies prove nothing, unless proof be needed that most college professors know little of the aptitudes of their students. The last forty pages of the book are occupied with historical essays, germane to the subject, though of no great value. An appendix gives a useful bibliography of American treatises on the calculus, thirty-three in number.

—M. Marcel Schwob, whose minute and fruitful researches concerning the life and works of Mr. Swinburne's sad, bad, mad, glad master, François Villon, have been heretofore noted in these columns, has just announced another discovery. Students of Villon will remember that, in the "Grand Testament," the first bequest that the poet sets down is one to Maistre Guillaume de Villon, who has been more than a father to him, he says, and gentler than a mother:

"Je luy donne ma librairie,
Et le *Rommant du Pet au Diable*,
Lequel maistre Gui Tabarie
Grossoya, qu'est hom veritable.
Par cayers est soubz une table,
Combien qu'il soit rudement faict,
La matiere est si très notable,
Qu'elle amende tout le meffaict."

Up to the present time it has been believed that this "Rommant" was a purely imaginary work, but M. Schwob has unearthed from the registers of the Parlement Criminel of the year 1453 a full account of the circumstances under which it was written. The troubles that abounded in that year between the students at Paris and the authorities had sprung from the imprisonment of thirty of the scholars who had been engaged in an escapade of a sort that has not even yet become wholly obsolete among undergraduates. There was a rock called the Pet au Diable that stood in front of the house of Mlle. de Bruyères, facing St. Jean de Grève, which the students managed somehow to transport to the Mont Ste. Geneviève. There they crowned it with flowers, and made the passers-by salute it, and tore down signs from the Halles and the Porte Baudet, and danced about it all night *à fleutes et à bedons*. Villon, as one might naturally expect, took his full share in these rejoicings, and was obliged to flee Paris in consequence. He took his revenge on Mlle. de Bruyères, whose servants had insulted the students, in the famous "Il n'est bon bec que de Paris," and besides, under the archaic form of the *rommant*, he told the story of the adventure of the Pet au Diable. This was doubtless his first literary work. So far as is known it has not survived. M. Marcel Schwob's paper was read before the Academy of Inscriptions and Belles-Lettres on January 17 of this year.

—Dr. Henry Simonsfeld, whose valuable history of the guild of German merchants in Venice was noticed in these columns some time ago, has just added another contribution to our knowledge of German colonial enterprises in Italy by publishing, in the Transactions of the Bavarian Academy of Sciences (Munich: G. Franz), a very curious constitution of a society of German citizens in the town of Treviso, which seems to have been founded about the year 1440, and which, towards the end of the fifteenth century, had attained a membership of some 400 persons. The chief aim of the society appears to have been mutual aid in case of sickness and distress, and the providing of a decent funeral in case of death. But it also regulated the every-day life of its members in a manner which reminds one of the restrictions and pledges of modern temperance societies. No member of the guild was allowed to play at dice for money with a fellow-member, or to play at all with an outsider. Under severe penalty, the brethren were forbidden to use bad language or to quarrel with each other. Each Sunday every member had to pay one shilling into the common treasury, "pro redimendis peccatis." With the exception of three clergymen, the society consisted exclusively of artisans and small tradesmen; the shoemakers, the innkeepers, the furriers, and the bakers leading the rest in numbers. The colony maintained itself, although gradually declining, until the end of the seventeenth century; and from the fact that the text of the constitution is given both in Latin and in German, the record of the members in German only, it would appear that it also maintained its nationality in the midst of foreign surroundings.

—Franz Gillparzer is unquestionably Austria's greatest dramatic poet, and is even regarded by many German critics as holding the very front rank in this province of German literature, side by side with the apotheosized Goethe and Schiller. The celebration of his centennial birthday on January 15 called forth enthusiastic expressions of this feeling, and showed the high estimation of his genius entertained by his countrymen. Not only in Vienna, his native city, but also throughout the length and breadth of Germany, from Munich and Stuttgart to Berlin and Hamburg, the principal theatres represented series of his plays, often eight or ten in number, and the press devoted columns of contributions to his praise. The Austrian Government gave official recognition to the day, and the Minister of Public Instruction ordered an appropriate commemoration of it in all the German schools of the polygenous and polyglottous empire. The Stuttgart publisher Cotta, who issued in 1887 a *Gesammtausgabe* of Grillparzer's works in sixteen volumes, with portrait and a "biographical - literary - historical introduction," brought out in honor of the occasion a "jubilee edition" of his minor poems, containing lyrical, epigrammatic, parabolical, memorial, and occasional effusions, many of which have no permanent value and might better have been omitted. This stout volume (pp. xiv, 612), which is a very full but by no means complete collection of the prolific author's *Gedichte*, concludes with four "Romanzen" forming part of a cycle of epic poems entitled "Rudolf und Ottokar," left unfinished and here printed for the first time. It was evidently his original intention to treat this half-legendary and half-historical subject in the heroic style of the Spanish "Poema del Cid," but he finally abandoned the project, and gave us, instead of a very mediocre epic (for his talent did not lie in that direction), one of the best of his dramas, "König Ottokars Glück und Ende," which, apart from its artistic and intrinsic excellence, has acquired a certain adventitious prominence and political importance on account of its irritative action upon the race susceptibilities of the Czechs.

TOY'S JUDAISM AND CHRISTIANITY.

Judaism and Christianity: A Sketch of the Progress of Thought from Old Testament to New Testament. By Crawford Howell Toy, Professor in Harvard University. Boston: Little, Brown & Co. 1890.

THE title of Prof. Toy's book does not so much express the slightness of his performance as the exigency of his ideals, for his "sketch" is an octavo volume of 456 pages. In criticism, as in painting or etching, a sketch may no doubt be "carried farther" and still be a sketch, and Prof. Toy's is carried very far indeed. Mr. Hamerton has said that "it is only the most accomplished artists who can be said to sketch at all, because it is only when the facts of nature are thoroughly known that the most necessary ones can be selected from the mass." Read critics for "artists" and literature for "nature," and his sentence would lose nothing of its truth. In one other particular Prof. Toy's title-page less accurately describes his book than in that already named. The period of which he treats is from Ezra, 450 B. C., to the middle of the second Christian century, but this period is by no means expressed by the terms "from Old Testament to New Testament," so much of the Old Testament was written after Ezra and after the traditional time of Malachi, 397 B. C. Nothing has been more characteristic of Old Testament criticism than its pushing forward of the various books into a later time. In this way great portions of the Pentateuch have been brought nearer to us 500, Deuteronomy 700, the priestly portions 900 years. The prophets have best stood their ground, but these, also, in some cases have been much advanced, Daniel from the sixth century to the second, Isaiah xl.-lxvi. from the eighth century to the sixth, and other parts of it still more, while Joel has been taken from the company of Amos and Hosea in the forefront of the prophets and set five centuries later (with some chapters of Zechariah) in their rear. The Psalms and other "writings," Ecclesiastes, Proverbs, Song of Songs, have tended forward at a much livelier rate than that of the prophets generally, and the consequence of this movement, with that of other books and fragments, is that the period between Malachi and Matthew, which once was a great blank of five centuries, or only partly filled by the Apocrypha, is now seen to be a period of great literary wealth, though much at the expense of the traditional Old Testament of the preceding centuries.

There is something reassuring in Prof. Toy's introductory sections on the general laws of the advance from national to universal religions. They are convincing that the habits of the specialist have not cut him off from that general outlook which is essential to any just opinion of the most isolated phenomenon. In this introduction he argues the dependence of religious development on social conditions, treats of the aggregation of tribal faiths into national religions, of the reactions of religion, science, and ethics on each other, of the relations of great men to their times, and exhibits the actual historical results of these forces and conditions in connection with others of a more external character. There is as much of philosophical breadth and human sympathy as of critical acumen in the whole discussion, and the same is true of the succeeding chapters of the book.

The first of these treats of the literature of the period, from Ezra to Philo, and is characterized by that filling in of the hitherto comparatively vacant centuries which is, we have already said, a notable feature of Biblical criticism in its general course. This is commonly spoken of by the traditionalists as "the attack upon the Bible," though it is evidently the work of scholars who bring to their studies a most tender conscience for the truth and the most loving reverence for the Bible literature. The truth would seem to be that hitherto the bias of traditional opinions has been a powerful brake upon the critic's wheels; that he has too strenuously endeavored to depart as little as possible from the received opinions as to the age and authorship of the books of which the Bible is made up. Prof. Toy's opinions are neither more nor less radical than those of other critics of first-rate ability, but they are remarkably divergent from those commonly received among us. To the "wisdom literature" of the Old Testament and Apocrypha he brings a lively sympathy; and, could he revise the canon, it is evident that the Wisdom of Solomon would be added as a counterblast to Ecclesiastes and the "fierce, intolerant nationalism" of Esther, which "makes no mention of God and has no consciousness of religion." For the apocalyptic literature of the period of which he treats, Prof. Toy has an admiration as qualified as that of Dr. Martineau. Of the opinion of Martineau, following Vischer and Harnack, that the Apocalypse of John is a Jewish work, with Christian additions, there is the briefest mention without approval or dissent. A concluding section of this chapter on the growth of the Old Testament canon, for all its quiet tone, is likely to

prove somewhat startling to the uninstructed mind.

In the six following chapters different subjects are taken up—"The Doctrine of God," "Subordinate Supernatural Beings," "Man," "Ethics," "The Kingdom of God," "Eschatology"—and the method of treatment is the same throughout: beginning with the earliest books of the period in hand, the course of thought is traced as it flowed onward to the latest. An appendix list of some 1,500 citations suggests the thoroughness of the investigation, but the manner in which the materials are handled is deserving of yet higher praise. Of *odium theologicum* there is as little as in the 'Essays of Elia' or the 'Sketch-Book' of Irving; from polemics it is just as free; and of dogmatism there is none. If, after the manner once suggested by Renan, only the certainties were printed in black ink, the lighter colors would be largely in excess. Withal, there is a naïveté in the presentation of the author's matter that is full of charm. The most radical and disintegrating propositions are stated with what seems to be a serene unconsciousness of their difference from the average opinions of the Christian world. Whether we have here a perfect art or the simplicity of the scholar's absolute engrossment in his search for sound results, we do not know, and it is not necessary to our satisfaction that we should.

The chapter on the doctrine of God reaches its highest point of interest in the exhibition of the Logos doctrine as developed in Judea and Alexandria, which had only to ally itself with the passionate idealization of Jesus in the early church to elevate him into a peculiar if not equal fellowship with deity; never into identity. The idea of the fatherhood was not, we are assured, unfamiliar in the higher religious circles at the beginning of our era; but Jesus made this opinion central to his teachings, and gave to it a human warmth and color it had never had before. The study of the views of inspiration which concludes the chapter is corrective of much popular misapprehension, which is assisted by the careless and rhetorical language of the average pulpiteer. The chapter on subordinate supernatural beings assigns to Satan a less derivative character than has been commonly assigned to him of late. The sharp definiteness with which he is conceived in the New Testament makes it appear that the two last centuries B.C. did much to make concrete an idea which in the Old Testament is thinly scattered, weak, and vague.

The chapter on Man is much the longest in the book, treating of a great variety of subordinate topics, but mainly of the varying conceptions of sin and righteousness. Jesus is represented as much nearer to the doctrines that he found in vogue than to those of Paul and subsequent soteriology. Prof. Toy never touches on the relations of Jesus and Paul without being profoundly interesting and suggestive. His idea is that Paul provided for the religion of Jesus a theological vehicle which made it popular and universal when it might otherwise have perished, but that to throw off the additions of Paul and return to the idea of Jesus is the work of Christian development which is not yet complete. Yet there is admission in at least one respect that Paul's thought was an advance: in the chapter on the Kingdom of God, Jesus is represented as having confined his work and hope entirely to the Jewish nation. The close alliance of his best thought with that of his own people, as current in his time, comes out most strongly in the chapter on Ethics. Prof. Toy finds the ethical teaching of Jesus substantially that of Judaism in his time, but with more enthusiasm and inwardness.

The treatment of Jesus's egoistic sanctions of morality has a more apologetic character than any other part of the whole book. In the chapter on Eschatology there is no comfort for the Andoverian and other restorationists whose hopes are stayed on the New Testament: "As to the duration of future punishment, the general doctrine of the New Testament is that it is to be without end—it is to endure as long as the blessed life of the righteous." In a concluding chapter nothing could be more moderate than the account of Christian origins:

"There was here an extraordinary concurrence of favorable conditions: a people with a firmly organized monotheistic faith, and in contact with the best ethical thought of the time; a circle within the people conscious of the lacks of the existing system and anxious to establish a higher spirituality; a general belief that God, in accordance with his ancient promises, was about to introduce a new order of things; a man who, by his extraordinary endowments, was able to inspire a select circle of followers with a controlling enthusiasm both for his person as the final deliverer sent by God and, in a germinal way, for those lofty principles of ethical religious life which he set forth in his teaching and illustrated in his conduct—these were the conditions of the birth of Christianity, briefly and roughly stated."

This account differs widely from the more dramatic one which generally obtains among us, and which sharpens the contrast as much as possible between Judaism and nascent Christianity, even Martineau saying that the growth of early Christianity was like that of "a delicate flower from a rotting soil." The main significance of Prof. Toy's book is in its opposition to this rendering. The four centuries before Christianity, which the Christian apologist has generally treated as centuries of decadence, of increasing formalism and lack of spirituality, are treated here as a period of religious growth, of heightening ethics and increasing spirituality. The increasing formalism is, of course, allowed, but the increasing spirituality was not less remarkable. The carrying over of the great body of the Psalms into this period goes far to justify the author's view. Perhaps there is no more crucial sentence in the book than this: "Jesus, in fact, did not announce any new dogma, and there was no reason why his followers should not remain Jews." This does not prevent the recognition that, by the stimulating and organizing power of his personality, he was in the highest sense the founder of a new religion.

A POOR LIFE OF SIR CHARLES NAPIER.

Sir Charles Napier. By Col. Sir William F. Butler. [English Men of Action Series.] Macmillan & Co. 1891.

THIS book is one of those to which the too little appreciated criticism, "The picture would have been better if the painter had taken more pains," may suitably be applied. Sir William Butler is a practised and vigorous writer. He had in Sir Charles Napier a singularly interesting subject. But he has treated his subject in such a hasty and slap-dash way that the chief result of the book is so to quicken our interest in Napier as to make us anxious to learn something precise about him. This so-called "Life" is, in fact, rather a rhapsody upon Napier and soldiering in general, and the selfishness of the rich and the meanness of the "shopkeeping" East India Company, than a statement of those facts in the career of a brilliant and memorable man which are, after all, the necessary things to be known if we are to have a clear impression of him and to judge his work in the world. Two-thirds of the book is comment rather than narrative, and even the narrative is provokingly allusive, leaving us to pick up or conjecture facts which ought to have been explicitly stated. For instance, we are nowhere told in what year Napier was born, nor how old he was when he died, nor what was his paternal ancestry. His grief at his wife's death is referred to, and it is implied that he left a widow, but nothing is said as to the date of either the first or the second marriage, nor is the name of either wife given. He wrote several books, but the references to them are very meagre and vague. We are prepared in several rambling pages to expect an account of his controversy with Outram over the outbreak of the Scinde war, and a number of other controversies which figured largely in the last years of his life, but this account never comes. The book is, indeed, one of the most unbusinesslike and unsatisfactory performances to come from a writer of real talent we have encountered for a long time. Nor is it always accurate in details. A soldier like Sir William Butler ought not, even by inadvertence, to tell us that the battle of Hohenlinden was fought in the Black Forest.

Nevertheless, provoking as it is to have pages of Carlylese given us when we want to know a hundred details about Napier which would have thrown light upon his character, the book is interesting, because there is enough in it of extracts from Napier's own journal, and of the notices of the bits of actual hard fighting he was concerned in to give us some notion of a very striking and peculiar person, one who accomplished much, but might, with better opportunities, have accomplished very much more and left a name second to few in the military annals of England. His career is, on the whole, a sad one, and the sadness of it consists chiefly in this, that so large a part of his life was wasted in inactivity, so that when the chance for doing great things came, not only was his physical strength terribly reduced, but his spirit had contracted, from a long-continued sense of ill-luck and neglect, a certain bitterness and self-assertive pugnacity which made enemies for him wherever he went. Fortune was certainly very unkind to him. He distinguished himself brilliantly in his first battle, the famous fight of Coruña, but the death of More took away the chief whose favor would have secured his advancement. He was severely wounded at Busaco, but was no sooner a colonel than his regiment was sent off to Bermuda, and he missed his chances of taking part in the later Peninsular campaigns of Wellington as well as of being at Waterloo. From 1819 till 1830 he had some intervals of employment in the Ionian Islands, then under British protectorate, and showed his usual energy in laboring for the improvement of the isles, and especially in making those excellent roads which the traveller still admires in Cephalonia. Then, after ten years more of absolute inaction, he received the command of the Northern Military District of England, a post which was in those days no sinecure, for there was much discontent among the masses, and it sometimes looked as if the riots which broke out here and there in the manufacturing and mining regions might gather into a serious insurrection of the suffering classes. Sir Charles showed prompt capacity in arranging the troops and in taking steps for the suppression of disorder. But he astonished his superiors by not infrequently indulging himself in political reflections unfavorable to the existing order of things; for he was in his opinions almost at one with the

Chartists whose apprehended rising it was his duty to suppress.

At last, in 1841, his chance for real war came. He was sent to India as commander of the Bombay army, and in 1842 went to Scinde to deal with the dangers which threatened them from the Ameers who ruled the country, and who had been brought by the unfortunate Afghan war into strained relations with the British Power. His part in the transactions which followed has been the subject of much controversy and a good deal of censure. Sir William Butler hints at this, and gives a sort of misty apology for his hero, but unfortunately passes away from the subject with a vagueness which is not only provoking, but unfavorable to Napier's reputation—a reputation strong enough to bear the telling of the truth. If he was blameworthy in precipitating the conflict, he showed himself not only a consummate general in bringing it to a swift close by two decisive victories (one of which, the battle of Meanee, ranks very high among the exploits of British soldiers against enormous odds), and in administering strict but benevolent justice in the conquered territories. Napier ought evidently to have been placed in command of the whole Indian army and intrusted with the Sikh war. The short but bloody campaign of 1846-47 would in his hands have been decisive, and the subsequent disaster of Chillianwallah averted. That disaster led to his being sent out again to India as Commander-in-Chief—for he had returned to England in 1847—and his last period of active work was spent in endeavoring to reform the military administration and avert the dangers of disaffection in the native army, dangers in which he foresaw the seeds of the great mutiny of 1857. In his zeal and somewhat too daring self-confidence, he took steps which the Indian Government disapproved (Sir William Butler characteristically omits to state Lord Dalhousie's part in these transactions), and resigned on receiving their reprimand. He returned in 1851, died in 1853—a naturally strong constitution broken by wounds and the terrible sun of Scinde—and lies buried not in Westminster Abbey, but in the military cemetery at Portsmouth.

In Napier's character and career as a leader three points stand out. He had splendid personal daring. He had great promptitude, decision, self-reliance. He had an intense sympathy for and interest in the private soldier, with a corresponding power of evoking the devotion of the private soldier to himself. What he would have been in planning and conducting a long campaign against European enemies and in handling vast masses of men, remains uncertain, because he never had the chance of showing. The army with which he conquered Scinde scarcely exceeded 5,000 men. Meanee was fought with 2,200, against nearly 30,000. Be this as it may, he was an extraordinary man, with a mind not more remarkable for its keenness than for its love of work, and he could scarcely have failed to win his way sooner to the highest posts but for the excess of fighting quality in him. He had a terrible gift for making enemies, a proud spirit, an uncompromising love of justice, and contempt for all men in power whose moral and intellectual eminence he questioned; a hot temper, which struck back quick and hard. No one could be less jealous of real genius, more loyal to his friends, more tender to his mother, his wife, and his children. But those who indulge their pride and impetuosity as Napier did and could not help doing—they were the *défauts de ses qualités*—must expect to find their upward path obstructed as his was. It remains, nevertheless, a disgrace to the English authorities of those days that when the English armies in India so often needed first-rate leaders, they did not employ so brilliant a soldier and vigorous an administrator till he had passed his sixtieth birthday.

A REVIVED CLASSIC.

A Vindication of the Rights of Woman: with Strictures on Political and Moral Subjects. By Mary Wollstonecraft. New edition, with an introduction by Mrs. Henry Fawcett. Scribner & Welford. 1890. Pp. 287.

Upon the theory that women have a claim to existence only as they render the existence of men agreeable and smooth, Mary Wollstonecraft was the first to make a regular and powerful attack. We may or may not agree with Mrs. Fawcett when she says, at the close of an admirable summary of and commentary upon the book whose title we give above, that the women's-rights movement in England and America owes as much to Mary Wollstonecraft as modern political economy owes to her famous contemporary, Adam Smith; but the honor of being first in the field she unquestionably deserves. It is difficult for any one at the present day to form a clear picture of the state of things as regards women at the time her 'Vindication' appeared. The contemporary books written for women and about women are, of course, no longer read, and the scattered allusions that one meets with in other books fail to make a connected impression. The 'Vindication' will serve a most useful purpose now in showing the conditions which it has been a powerful means of changing, as it did then in setting forth their injustice and their folly.

We give some quotations to show the common tenor of opinion which Mary Wollstonecraft set herself to combat. And first, the whole situation is set forth, with the utmost candor and simplicity, in the following passage from Rousseau's 'Émile':

"For this reason, the education of women should always be relative to that of men. To please, to be useful to us, to make us love and esteem them, to educate us when young, and take care of us when grown up, to advise, to console us, to render our lives easy and agreeable—these are the duties of women at all times, and what they should be taught in their infancy."

The virtues which they need are relative to their dependent position:

"The first and most important qualification in a woman is good-nature or sweetness of temper. Formed to obey so imperfect a being as man—often full of vices, and always full of faults—she ought to learn betimes even to suffer injustice and to bear the insults of a husband without complaint."

Subtilty and indirection, far from being subjects of reproof, were inculcated as useful qualities. Dr. Gregory, whose book, 'A Legacy to His Daughters,' was a standard work on female propriety at the end of the eighteenth century, recommends constant dissimulation to girls to whom nature has given a robust constitution; a sickly delicacy was considered an indispensable element of feminine charm; and Rousseau says: "Subtilty is a talent natural to the sex, and I am of the opinion that it should be cultivated; it is requisite for us only to prevent its abuse."

Under no circumstances of her life was a woman ever to forget that her sole end and aim was to please her lord and master; every one must share the "sickly qualm" which Mary Wollstonecraft felt at this passage from the Rev. James Fordyce's sermons addressed to women: "Never," he exclaims, "perhaps, does a fine woman *strike more deeply* than when composed into pious recollection; . . . she assumes, without knowing it, superior dignity and new graces." There were no limits to the overstrained modesty which was necessary to fit women to men's taste. Dr. Johnson thought portrait-painting an improper employment for a woman. Staring in men's faces, he observed, is "very indelicate in a female." Another writer says:

"The lady who asked the question whether women may be instructed in the modern system of Botany, consistently with female delicacy, was accused of prudery; nevertheless, if she had proposed the question to me, I should certainly have answered: 'They cannot.'"

Although the devotion of men was the only object for which women lived, they were counselled never to let their own sensibility become apparent; female modesty was held to be outraged by the confession of love from a woman to a man, even when that man was her husband—she must always strive to make it appear that her physical and mental weakness had caused her to yield to force. It follows from all this that cowardice, as well as physical weakness, and ignorance, pretended when not real, were an essential part of a woman's attractions. Dr. Gregory says: "But if you happen to have any learning, keep it a profound secret, especially from the men, who generally look with a jealous and malignant eye on a woman of great parts and a cultivated understanding."

Against this immoral and indecent state of opinion concerning women, Mary Wollstonecraft uttered a vigorous protest. As a specimen of fine and impassioned reasoning, her book has seldom been surpassed. Its faults are its too great length and its repetitions; they result from the haste with which it was written (it was finished in six weeks), but that same haste lends it a fire and a passion which more pruning might have robbed it of. Her main plea is that women should be allowed to cultivate their understanding, and that men should be content with rational fellowship instead of slavish obedience. She urged that women should be placed in a station where they would advance instead of retarding the progress of the human race. She showed that if women be not prepared by education to become the companions of men, they will stop the progress of knowledge; and that, so far from knowledge and freedom inducing women to neglect their duties to their families, 'the more understanding women acquire, the more they will be attached to their duty—comprehending it; for unless they comprehend it, . . . no authority can make them discharge it in a virtuous manner."

For those who grow impatient under the restrictions from which women still suffer, it is a source of courage to note the immense changes that have taken place in their status in the hundred years since the writing of this book. The change in the worth of women as human beings has been correspondingly great. Mary Wollstonecraft accuses the women of her day of cunning, superstition, want of generosity, injustice, and gross mismanagement of their children and of their households. No such gloomy picture could be drawn of their characteristics now. Maurice said, as quoted by Mrs. Fawcett, "In any sphere wherein women feel their responsibility, they are, as a rule, far more conscientious than men." There is no doubt that this is true, and there is no doubt that as they interest themselves more and more in theoretical politics, in political economy, in social reform, and as they feel more and more the necessity of giving effect to their wishes at

the polls, they will more and more represent what is admirable and useful in the citizen and in the human being. Mary Wollstonecraft, while she is chiefly occupied with more urgent matters, did not hesitate to claim for women a share in the advantages of parliamentary representation. She pointed out that women are peculiarly well fitted for the practice of medicine, and she anticipated Ibsen, almost in his very words, in preaching that "their first duty is to themselves as rational creatures." What yet remains to be done, in England and America at least, ought not to be long of accomplishment—will not be long of accomplishment when women themselves have learned to recognize its necessity.

Facsimiles of Manuscripts in European Archives relating to America. 1773–1783. Vol. VI. Nos. 565 to 646. London: B. F. Stevens.

THIS volume is made up principally of papers concerning the attempt of Silas Deane to obtain help for the United States from France in the year 1776. That envoy was active and persistent, making bargains with Beaumarchais and others, engaging and despatching officers, writing long minutes ("memoires" he called them) on the resources of the united colonies, the justice of their cause and the interest of France in the quarrel. Deane's services have met with scant recognition. The American Government suspected the good faith of his dealings with Beaumarchais, and treated not only that adventurer, but their own agent, very shabbily. The officers who were sent over made a great deal of trouble, until Du Coudray was fortunately drowned and Conway finally discredited. As for the minutes, the longest and most elaborate of them was that of the 24th of September, 1776, of which Deane wrote to Congress that he had been confined to his chamber and pen for some weeks in drawing it up. Alas! we may read in the facsimile the note of the French Foreign Office, "*Pièce non traduite*," and therefore be certain that it never reached the eye of King Louis XVI., or even of the Count of Vergennes, for neither of them could read English. Still it may have influenced the mind of Gérard, the Minister's right-hand man in American matters. The paper contains one suggestion at least which might have had weight with the French court, for it confirmed a suspicion already in the minds of the King's advisers. This was that in case of a reconciliation between Great Britain and her colonies, their united forces might be turned to the conquest of the French West Indies. On the other hand, Deane was ready to suggest, as one of the bases of a treaty between France and the United States, that any British ship found on the coast of North America, South America, or the islands adjacent and belonging thereto, within a certain degree or distance to be agreed on, should be for ever thereafter considered as lawful prize to any of the subjects of France, Spain, or the united colonies and treated as such, as well in peace as in war; nor should any of the contracting parties ever admit any British ship into any port in America, North or South, or the adjacent islands; nor should that article ever be altered but by common consent of the three governments.

The ultimate decision of the question of an alliance, with all its probable consequences of peace or war, rested after all with the King of France. It is from this circumstance that a long paper bearing the name of "Pfeffel," and found in the French Archives of Foreign Affairs, derives an interest. Louis XVI. was a man of weak mind, but active conscience. It was therefore necessary for Vergennes to give him moral grounds for a decision, but those grounds might be more plausible than reasonable. This would appear, from internal evidence, to have been the object of Pfeffel's paper, which is dated October, 1776. The question which the writer sets himself to answer is whether the eternal laws of justice permit other Powers, and especially those which have been objects of rivalry to England, to contribute to the ruin of that country. This question implies two others: whether there are cases in which subjects can legitimately abandon the rule of their sovereign; and whether, in those cases, foreign Powers may meddle in the domestic quarrels of a State, and favor the defection of its subjects.

As to the first of these questions Pfeffel, while adhering to some extent to the doctrine of natural and inalienable rights, is yet courtier enough to distinguish carefully between absolute and limited monarchies. Under a despotism he holds that the nation may rise against its sovereign only when he transgresses its fundamental laws, as by attempting to change the order of succession or by atrocious tyranny. The rights of nations are much more extended in a limited monarchy. All the laws that have there been passed to limit the sovereign authority are a part of the fundamental code of the State. They mark the extent of the prince's power and the way in which he must apply it. If he goes beyond the limits which are set for him, his commands are unlawful, and the nation is not bound to obey him. In attacking the Constitution of the State, the prince breaks the contract which united him to his people, and frees the latter from its allegiance. All that he can then ask of the outraged nation is, that it should conduct its opposition with those shades and gradations which are in accordance with the respect due to the sovereign majesty.

The Dutch religiously observed these degrees when they threw off their allegiance to Spain, but the English have frequently neglected them. They did so especially in 1688, when King James II. was deposed after he had desisted from the unlawful acts which he had previously committed, had released the bishops whom he had imprisoned for resisting him, and had solemnly promised to govern for the future only by lawful methods. On this occasion the revolution was carried out by the Prince of Orange, with the assistance of the Dutch Provinces. This revolution is constantly referred to in British acts of Parliament as lawful, and it was in fact that which opened the way for the succession to the English throne of the House of Hanover.

From these facts there follow some very interesting consequences, viz.: that, according to English jurisprudence, the prince has only to violate some law of the State, even if the law be not fundamental, to deserve to be deprived of his power; and that the State may scorn the reparation which he offers or actually performs; that the State may then meet in extraordinary assembly and change its form of government; that foreign Powers may provoke revolutions of this sort, and may furnish aid necessary to their accomplishment.

The writer applies these doctrines to the American Revolution. The English colonies in North America differ, according to him, from all other colonies, whether of ancient or modern times, in that the colonists carried with them to America all their rights as Englishmen; and among those rights that of voting their own laws and of consenting to the taxes they are to pay is held to be essential. Under these circumstances the colonies may rise in revolt, if their rights be infringed, and may call on foreigners to help them. The only difference between them and the English of 1688 is all in favor of the colonists, for the latter have observed all those shades of procedure which were conspicuously neglected in the earlier revolution. The Americans began by remonstrances and protestations. When these were scorned, they opposed the execution of unconstitutional regulations, but obeyed all rightful laws. Only when the mother country announced the intention of sustaining her illegal conduct by force of arms did the colonies combine for defence. Nor did they finally renounce their dependence until they had seen their cities destroyed with fire and sword, and the three British kingdoms and a part of Germany united to subjugate or utterly to destroy them.

The writer concedes that it is contrary to the law of nations for one country to interfere in the domestic concerns of another. But when a tyrant tramples on the laws of humanity; when he violates the most sacred obligations; when the oppressed nation, after trying peaceable means in vain, breaks at last the bonds which attached it to its sovereign and makes itself independent, so that in fact the State is dissolved, then foreign Powers may certainly judge the quarrel on its merits, and help the party which shall seem to have right on its side.

Having reached this satisfactory conclusion, Pfeffel proceeds to support it by historical instances. He mentions the help given by England to the people of Rochelle against Louis XIII. of France, and to the House of Braganza in revolting against Spain and establishing the kingdom of Portugal. But most he relies on the assistance furnished by Queen Elizabeth to the Low Countries when they threw off the yoke of Philip II. With great skill the writer points out the devious course pursued by the English Queen, her professions of friendship to Philip, her offers of mediation, her secret help to the Dutch, and her attempts to rule them. The resemblance of her action as here described to that which Vergennes was actually urging upon the King of France is made thoroughly obvious, and a course of duplicity, repugnant in fact to the principles of the feeble young monarch, is shown to be in accordance with royal precedent.

Did Louis XVI. really listen to the suggestions of this paper? The place whence it comes renders such a listening not improbable. Already he was partly committed to a dishonest line of action, and had given aid in money to a rebellion against a friendly Power. Hardly three months after the date of Pfeffel's paper, the King approved with his own hand a document evidently meant to be read to Franklin and Deane, assuring them of his good wishes to the united colonies. Yet peace was maintained with England for more than a year longer, and the British Ambassador was put off with excuses for all his complaints. It takes, indeed, a stronger man than Louis XVI. to believe that statesmanship is not a cheating game, and to act up to that belief.

Wild Life on a Tidal Water. The Adventures of a House-Boat and her Crew. By P. H. Emerson. Illustrated by 30 photo-etchings, by P. H. Emerson and T. F. Goodall Together with an Appendix, "Breydon, Past and Present." London: Sampson Low & Co. 1890.

WE have before had occasion to praise the singularly attractive work of Mr. Emerson's pen in sketching scenes of wild life in East

Anglia and on the Norfolk Broads; and in the present volume we find the same delicacy of observation and truth of rendering, together with a certain sentiment of the landscape hard to characterize; and, besides, there is a stronger literary style than hitherto. The scene is a stretch of tide-water at Yarmouth of large compass, called Breydon, some four miles and a half long by one and a half broad, lying at the mouth of the River Yare; it is the first thing seen by the migratory birds, since it reaches out into the North Sea, and hence more rare birds are said to be found there than anywhere else in England. At all events, its low-lying flats and shallows at the ebb-tide seem to have more than the usual fulness of life on the edges of the sea, and in Mr. Emerson the place finds an artist as fond of natural history in its own home as of landscape effects.

The charm of the book, however, does not lie so much in what it tells of the look and behavior of birds and fishes, crabs and eels, and the like, as in the reality with which it conveys the sense of the ocean in the full range of its life, in storm and calm, in color and atmosphere and tone, in its ugliness and dark underworld. These descriptions of mist and mirage, of the ooze and green grasses, the miniature battles of the crabs, the flying of the wounded bird, the fishers and the passing boats, the changing sky and wind, and the increasing loneliness as the rising tide isolates the boat at its moorings and removes the land far off—all these scenes and incidents and moods will be welcome to any lover of the sea, and he will find in them a rare truthfulness. Mr. Emerson says that he writes his descriptions always upon the spot, and that this gives them what merit they have. It adds to their effect that he does not omit any of the unpleasant features, the gross and rude things that belong to the tides, but he has the skill not to offend; he is a realist, whether in his water-colors or in his mud-photography, and in both his work is novel, sincere, and admirable.

In one point he has been especially successful. He gives the amphibiousness that always belongs to the sea. The taste for character is genuine with him, and it is clear that by virtue of it he was able to make friends with the fishers and fowlers, and to draw from them in their dialect not only "yarns" of the ocean, but also their superstitions, their ideas (or what served as such), their life as it was in their own hearts. There is the same reality in his report of their talk as in his drawing of the public houses where he chatted with them over the friendly glass of rum; and these living pictures of the rough interiors and their figures contrast happily, or blend happily, as one chooses to think, with the impression of the sea which was their element. The sea, in its nature, its wild life, and the human beings who live by its spoil, is the subject of all these chapters; and the text is saved from the cloying of mere description by an occasional incident or conversation or adventure. There is a drowning accident, for example, which for true realistic power is very remarkable even in these days of so much would-be realism; it is pathetic in itself, but the circumstances are so rendered, and the words and actions of the spectators are so directly set down, that it seems the thing itself. This, however, is fortunately only an episode: the body of the book is in the mood of a free, natural love of outdoors, of the fresh sea, and all that it affects with its wide presence.

The illustrations are thirty photo-etchings of the scenes from plates made at the time. They are mostly of the sea, its coasts and tideways, its ships, the wharves, and the fishermen, with a few glimpses of old Yarmouth streets and roofs, the rope-walk, the sail-loft, and like subjects. Mr. Emerson states that he was the first person to study and publish etchings from photographic plates taken from nature, and he tells something of his experiments. The present plates were etched by Mr. Colls and Mr. Dawson, but hereafter Mr. Emerson will etch his own plates, a practice which he recommends as necessary for those who would do this sort of work. He has experimented with all kinds of printing-papers, he adds, and with excellent results. In the present volume he has seen and approved all the prints as well as the proofs, and he thinks this care is also necessary if the original work is to be justly rendered. In all this one recognizes the same fidelity and exactness which is to be observed in his literary sketching. The success of these illustrations is excellent, as a rule; they vary in vivacity and in the quality of their tone, but in each case a definite effect has been sought and frequently has been finely given. The pictures are not closely related to the text, but come in like a margin in which the feeling of the text is found again in another mode of artistic expression. The entire volume, which is a beautifully printed folio, is thus a sea-book. At the end is a map of Breydon and an account of the birds which have been found there, with some hunter's notes, by R. Fielding Harmer.

An Elementary Latin Dictionary. By Charlton T. Lewis, Ph.D. Harper & Bros. 1891.

Dr. Lewis's new work is substantially an abridgment of his 'Latin Dictionary for Schools,' which appeared some two years ago. All that is new in it (except the correction of such errors as have been found in the earlier book) is the extension of the vocabulary to include words used by Catullus, Tibullus, Propertius, and Tacitus (in his larger works). It was a pity that these authors were not included in the 'School Dictionary,' and a still greater pity that the call for them was not as loud here as in England. On the other hand, the examples under the different words are limited to those which are typical or peculiarly instructive. Moreover, reference is made only to the author who used the words, and not to the exact place in his writings in which he used them; further, all but a few proper names have been excluded. In these ways much space has been saved, and yet the examples still remain amply sufficient for the needs of those for whom the book is intended.

Being an abridgment of a work that is already well known, and that has been received in all quarters with admiration and approval, there is no need of extended remarks upon details of the present book. It is without any doubt the most scholarly and correct elementary Latin dictionary that has ever been published in English. Our only fear is that the very excellence of this small volume may lead students who are no longer beginners to be content with it, and not to feel that they ought to own the 'School Dictionary,' and, finally, the largest of Dr. Lewis's three works. Doubtless every college teacher has felt the difficulties that arise from the unwillingness of his pupils to use a more advanced and larger lexicon than the one they had at school. It will be a comfort, however, for teachers to feel that this book is likely to supplant a certain elementary dictionary published in England, and very generally used in this country, full though it is of antiquated notions, especially in the matter of orthography.

It is to be hoped that Dr. Lewis will not yet rest content with the laurels which he has already won. There remains still a task for which he has himself cleared the way—the revision of his large lexicon. In spite of the many improvements which he introduced, and the careful toil which he bestowed upon that revision of Andrews's Freund, nobody knows better than he the faults and inconsistencies which remain in it. It is much that is asked of him, for there are few tasks so arduous and so uninspiring as dictionary-making. But for him success is assured in advance, as well as the gratitude of classical scholars throughout the world.

The following notes on the 'Elementary Dictionary' are offered more as contributions to further work than in the spirit of criticism. Under *condico*, the example from Livy with the dative should not be quoted without the very curious genitive which seems to be somehow connected with the verb. A more literal meaning shou'd be assigned to the word *sagmen*. In the example cited *sagmina* are "tokens of inviolability," a sort of safe-conduct, which happened in that instance to be the tuft of grass borne by the *fetiales*. Under *defungor* the ablative *poena* cited is instrumental and not "dependent" on the verb. For *contaminare fabulas* Dr. Lewis may feel inclined to adopt Prof. F. D. Allen's simple explanation (in the Proceedings of the American Philological Association, 1888) instead of the forced traditional one. Of *ellum* Prof. Lane has shown that it must be composed of *em illum*, and not of *en illum*.

A Treatise on Extradition and Interstate Rendition, with Appendices containing Treaties and Statutes, etc. By John Bassett Moore, Third Assistant Secretary of State of the United States. Boston: The Boston Book Co. 2 vols., pp. 1,556.

We have here an exhaustive treatise, and a thoroughly useful manual for the practitioner in all extradition cases. The duties of Mr. Moore as Assistant Secretary of State have included the investigation and report upon international cases of extradition, and have led to his preparation of this important work. He distinguishes logically between the cases arising either in the application of international comity to the rendition of fugitives from justice, or in the enforcement of treaties, from those which come under the Constitution of the United States when persons accused of crime in one State escape to another. This latter he very properly describes as the application of our own law (constitutional or statute) to domestic cases arising in different parts of one nation, and to it he prefers to give the name of Interstate Rendition. Extradition he reserves as the name for taking an accused person beyond the national boundaries to answer for his alleged crime in a foreign country.

While this distinction is useful as well as logical, it is still consistent with the fact that interstate rendition, like many other things in our Federal Constitution, bears the marks of the *quasi*-independence of the colonies from which the nation was formed, and has strong analogies with the practice of international extradition. As the subject is developed it also becomes evident in an interesting way that international extradition has been rapidly growing into a system which approximates closely to the domestic code enforced by the Federal Constitution. Nearly the whole civilized world has, by treaties, entered into a sort of federation which, we may reasonably hope, is only one chapter in that larger federation

which shall systematize all matters of common interest, and provide for their conduct and their settlement without danger of quarrel or dispute.

The steps of the progress are full of instruction. When nations were ignorant of each other, there was hardly a distinction between an alien and an alien enemy. An English king would hardly think of giving up a man to the Emperor of Germany sooner than he would to the Sultan of Morocco or the Caliph of Bagdad. The growth of knowledge begot an increased good-will. Commerce created good-neighborhood. As surely as the law-merchant grew out of the custom of merchants in international commerce, so did the comity of nations which assisted in the enforcement of criminal justice grow out of the intimate acquaintanceship which followed the intercourse of trade. The nations of Christendom, acknowledging a common standard of morality, felt the obligation of reciprocal assistance in the preservation of order and the punishment of crime. The varying codes and the diverse schemes of punishment made it a slow process, for it seemed shocking to send a man abroad to die for that which would only be punished with imprisonment or fine at home. So the comity was considered a thing rather recommended by the law of nations than commanded by it, and governments began, tentatively, to return criminals in their discretion as a mark of favor rather than as the performance of an obligation. They were willing to apply the principle to crimes *mala in se*, the felonies declared such by the consensus of civilized custom, whilst they declined to apply it to the *mala prohibita*, the somewhat artificial offences created by statute.

But the very discussion of the subject was a powerful educator. Laws tended rapidly to assimilate, and harmony grew up, the scale of offences and the measure of punishment becoming more and more alike. It is most profitable now to look over the long list of modern governments which have provided by treaty for the extradition of criminals, and to see how these numerous treaties are in fact an international code having the force of positive statute among nearly all the progressive peoples of the globe. It is very instructive, too, to note what is excluded as well as what is included in this code. The rights of free thought, of political opinion, are jealously preserved for the individual. The right of asylum for the voluntary exile is broadly recognized. The definition of essential vice has been made more definite. The wickedness of crime is distinguished from a violation of law which may be conscientious. The common enemy of mankind is separated from the well-meaning enthusiast who may have challenged with noble motives the law he seeks to repeal. Perhaps few of the nations which made these treaties realized fully, as they were added one by one to the long catalogue, how well they builded. A similar series of treaties in regard to arbitrations of disputes would add another great chapter to the international code, and another strong link to the "federation of the world."

The provisions for interstate rendition are part of a chapter in our domestic history hardly less significant for us than the other is for the civilized world. It is curious to note how much of the hesitation, the disputing, the wire-drawn interpretation, the conditional obedience in the several States grew out of slavery, that cause of all our woes. But for it we should hardly have cared now whether a man were carried from Massachusetts to Georgia to be tried, or from New York to Albany. There was no true faith in the impartial justice that would be awarded when the offence was related to the great sectional controversy, and the universal instinct was to protect him who was charged with a political crime, by limiting very closely the right of rendition in all cases. With the death of slavery, it is plainly seen that in this respect, also, we have become much more truly one people.

Mr. Moore has not devoted great space to such philosophical considerations, but he has given rich material on which to base them. He has made his work a thorough history of his subject and a trustworthy hand-book for the practitioner, in doctrine, in array of precedents, in practical forms, and in useful suggestions based on experience. It is a marked advance upon other books on the subject, and will be a standard authority.

Ein Lebenslauf: Aufzeichnungen, Erinnerungen und Bekenntnisse von Julius Froebel. Stuttgart: Cotta. 1890. Vol. I., pp. 608. 8vo.

FROEBEL'S 'A Life-Career,' the first volume of which has recently appeared, is one of the most charming of contemporary German autobiographies. The author, now in his eighty-fifth year and still fresh and vigorous in body and mind, was the son of a country parson in Thuringia, and the opening chapters, in which are recorded the reminiscences of his childhood, give an enchanting idyllic picture of modest middle-class German life at the beginning of the present century. The poverty of his parents threw the boy in early youth upon his own resources, and compelled him to earn, as topographical draughtsman, cartographer, and lithographer in the Black Forest and Alsace, the means of pursuing his studies at Berlin, Jena, and Munich. He won the esteem and enjoyed the friendship of Alexander von Humboldt, to whose influence he owed his appointment as professor of mineralogy in the University at Zurich, where, in addition to his academical duties, he also conducted a book-publishing establishment, chiefly, as it appears, for the purpose of revolutionary agitation and propagandism in Germany.

In 1848 Froebel went to Mannheim as editor of the *Deutsche Volkszeitung*, a paper issued by the publisher Hoff in the interests of the German democracy, and the first number of which appeared, ominously enough, on the 1st of April. In this enterprise he was associated with Hecker, Herwegh, Jacoby, Ruge, Struve, and other leaders of the revolutionary party. The editorial office was a Noah's ark full of clean and unclean beasts. Every collaborator had his crotchet, upon the realization of which he made the safety of the universe depend. Gustav Struve saw no hope for mankind except in dietetic reform and phrenology. A crank named Ernst Mahner seated himself naked on a block of ice in midwinter and floated down the Main, in order to show the inhabitants of Frankfort how the human race, rendered effeminate and servile by civilization, could be restored to its primitive health and independence. A kindred spirit was Edgar Bauer, who regarded clothes as the curse of humanity and confounded nudity with purity. Habiliments were in his eyes the primal source of all evil habits. When Froebel had occasion to call on him in Berlin, he found this prophet of the new era sitting in an Edenic state on the sofa and receiving his friends. In the presence of this gymnosophist, our author, who was well attired and actually wore gloves, had the appearance of an inveterate Philistine and thorough-paced reactionary.

Of all his colleagues, however, the most offensive was Edward Pelz, a vulgar demagogue, who, by the skilful use of hollow and high-sounding phrases, had acquired great popularity and become the head of a large "Laborers' Union." He was shrewd, self-seeking, wonderfully expert in inventing pretexts for levying on the working classes frequent contributions, which flowed ultimately into his own pockets, and may be regarded, in some respects, as the forerunner of the Walking Delegate of to-day. It was the recollection of this man that led Froebel to record the following reflections in his memoirs: "Political expediency requires us to associate with all sorts of people, but personal honesty always remains the only safe basis of profitable co-operation even in party politics; and to overlook this factor is a political error. The filth which proceeds from a corrupt individual defiles the cause which he represents, and in no form of government is it so essential to insist upon nobility and integrity of character as in a democracy."

Froebel was elected a member of the German National Assembly which held its sittings in the Paul's Church at Frankfort from May 18, 1848, to May 30, 1849, and, as one of the four delegates sent with an address of congratulation to the revolutionists in Vienna, narrowly escaped being shot with Robert Blum. The collapse of the republican movement in Baden forced Froebel to flee, and the former professor and politician settled down in New York as a soap-boiler. It is to his credit and in strict conformity with his antecedents that, although he soon began to write for the press and to take part in public affairs, he confined his dealings in the matter of "soap" to the common commercial article that cleans and not corrupts, and never soiled his hands with the sort now so lavishly used for lubricating the party machine in a political campaign.

Froebel's love of adventure induced him in 1850 to go to Central America as a newspaper correspondent and subsequently to act as agent for a commercial house in the frontier provinces of Mexico and the United States. His power of keen observation and the lively sense of humor which stood him in such good stead among the crack-brained social experimenters at Berlin and Frankfort in 1848, and kept his own idealizing impulses from drifting into like extravagances, render his descriptions of society in those semi-civilized communities not only fascinating reading, but also a valuable contribution to the history of a transition period unknown to the annals of European nations and quite unique even in the remarkably rapid expansion and evolution of American civilization.

He spent six months at Chihuahua, which interested him as a mineralogist on account of its once famous silver mines. Among the female portion of the population prostitution was general, and the greed of the clergy compelled the poorer classes to dispense with the marriage ceremony altogether. "The native inhabitants were by no means lacking in intelligence and a certain degree of culture. In a company of Mexican officers I was asked the name of my birth-place. 'Rudolstadt,' I replied. 'Ah—— Schwarzburg-Rudolstadt,' remarked one of the officers. 'There is also a principality Schwarzburg-Sondershausen.' I looked at the man with astonishment; whereupon he added laughingly: 'Do you think we Mexicans are barbarians and know nothing of the world?'" On an excursion with a German named Feldmann, who had lived in the country several years, they stopped over night in the village of Carretas, where they en-

joyed the hospitality of a distinguished resident of the place. Beds were prepared for them in the large hall of the house, and, as Froebel was quite exhausted by the day's journey, he expressed to his companion the hope that their kind host with his wife and beautiful daughter would withdraw in order that they might retire to rest. "For that you will have to wait a long time," said Feldmann; "the good people are staying to see us undress." "And in fact we were obliged to go through with this business in the presence of the ladies, who observed all our movements and examined every article of our wardrobe with the greatest attention, but with irreproachable decorousness and delicacy of manner, and, after we had lain down, bade us a friendly goodnight."

Froebel arrived September 30, 1854, in San Francisco, where he edited a German paper of liberal and anti-slavery tendencies, the *San Francisco Journal*, and came thereby into unpleasant competition with a rival sheet of ultramontane and pro-slavery proclivities, called the *Democrat*. He found life in San Francisco not only richer in humor, but also far more poetic and more spiritful (*geistvoller*) than elsewhere in the United States:

"The very sight of motley groups of men on the streets suggests scenes and situations in some great romance full of adventurous characters and incidents, unusual destinies, and developments of power. However different the persons thrown together in this land may be, all of them, from the conscientious merchant to the swindler and defrauder, from the thorough man of science to the most shameless charlatan, from the puritanic reformer and missionary to the incendiary and highway robber, have one thing in common, namely, extraordinary understanding and extraordinary energy. Without these qualities no individual could maintain himself here. It is therefore not without some reason that every Californian prides himself more or less on belonging to the élite of the human race; this, however, must be understood of the evil as well as of the good, although I have always found the good preponderating over the evil. . . . I can recall numerous crimes and some prodigious rascalities, but these were more than outweighed by noble traits of character and an earnest and general endeavor to improve."

"It is also a mistake to suppose that there was a lack of intellectual intercourse in San Francisco; on the whole, the people were as cultivated, humane, and amiable as in any European city, only there was a greater proportion of men of large experience and tried qualities, and endowed with keener powers of understanding than are to be met with anywhere in the Old World."

In 1855 Froebel sailed for New York via Nicaragua, where he had been before as agent of an interoceanic canal company. In 1856 he married the Countess Caroline von Armansperg, daughter of the Bavarian Minister and Greek Chancellor under King Otto, and returned to Europe in the following year. This repatriation forms the conclusion of the first volume. The second volume will record the events of his subsequent career as politician and publicist, and his experience in the consular and diplomatic service of the German Empire.

La Réforme Française avant les Guerres Civiles, 1512-1559. Par Mme. C. Coignet. Paris: Fischbacher.

FROM her study of the different phases of the French Reformation, Mme. Coignet is convinced that for France the sixteenth century was one of those solemn moments when a slight accident might radically change the direction of the nation's development. As a whole, the people were, she thinks, inclined to enter the reform movement. Up to the time when the civil wars had given rise to fanaticism, only a few, grouped around Diana of Poitiers, the Constable Montmorency, and Cardinal de Tournon, supported the policy of persecution. Indeed, "Francis I. might have established the Reformation in France more easily than Henry VIII. in England." "For what did the nation's destiny wait, then? For an Anne Boleyn, perhaps."

Mme. Coignet's interesting descriptions treat the principal features of the period under discussion with, generally speaking, sufficient fulness. Her explanations throw especial light on the obscure history of the prosecutions for heresy under the Edicts of Francis I. and Henry II. From a bill presented by a worthy executioner named Rousseau to the Parlement of Paris in 1553, the comfortable heretic of these less strenuous days may learn that it would have cost the State but twenty-two sous to have religiously quartered him in that twilight of the "Ages of Faith," though the knife would have added sixty-one sous to the charge. There was little room in the world at that time for consistent believers in the relativity of human knowledge. In fact, Geneva would have been quite as uncongenial as Paris. Mme. Coignet sets forth in its ugly nakedness the well-meant but odious tyranny which Calvin established there. It should not be inferred, however, that she fails to appreciate the great work Calvin so unselfishly accomplished. Her chapter describing this gains all the force of a striking contrast from the fact that it is preceded by her account of the disagreeable aspects of the Geneva régime.

It may be said that in a few instances Mme. Coignet does not seem to have been able to give sufficient weight to opposing views on important historical questions. She insists that the French Reformation was a purely national movement, neither inspired nor directed from without. No one will attempt to deny that it bore the stamp of its nationality distinctly upon all its phases, and yet the unprejudiced historian must acknowledge that Luther's influence at least furnished a strong impulse. Mme. Coignet seems disinclined to grant Luther any share at all. In discussing the origin of the movement she refers to him only in the most incidental manner, adding a rather meagre account of the German Reformation near the close of the volume. Nevertheless, there is some very good evidence to show how important, though indirect, a part Luther played in arousing the French from their ecclesiastical slumbers. The proofs are so good that the judicial Von Polenz, in his history of French Calvinism, calls the early period of the French Reformation "der lutherisch-französischen Reformation." He quotes, among other things, from a contemporary diary kept by a certain Hemont of La Rochelle, the words, "The trumpet which Luther blew in Germany in 1517 waked all the spirits up in France." The fact that the French reformers were so universally called Lutherans, Polenz cannot believe to be utterly without significance. Mme. Coignet thinks this cry originated in the attempt to stigmatize the efforts at reform as revolutionary, as they then threatened to be in Germany. The language of Franz Lambert, who went to Germany soon after he was converted, seems quite conclusive evidence of Luther's influence in France. Lambert, in his commentary on Hosea, wrote: "There come out of our France counts, knights, nobles, and others to see the master workman Martin Luther." Moreover, we must not forget that Louis Berquin got his inspiration largely from Luther's writings. Mme. Coignet's attitude on this question is apparently the reason why she deigns but a few words in a foot-note about the projects for the reconciliation of the faiths which Francis I. laid before Melanchthon.

It is somewhat surprising that the author should not have noticed her error in stating that Luther burned the Papal bull at Wittenberg, November 20, 1520. Unfortunately this is not the only case of inaccuracy in the use of dates. When she refers to the doctrine of the "Three Marys" (p. 43), she inadvertently includes the mother of Jesus among them.

A Dictionary of Electrical Words, Terms, and Phrases. By Edwin F. Houston, A.M. New York: The W. I. Johnston Co. 12mo.

THE work before us is interesting from more than one point of view. It is an encyclopædia rather than a dictionary, aiming to make definitions clear by a certain amount of explanation and illustration; and within a moderate compass it presents a very striking picture of the immense fertility of modern electrical science as illustrated by the richness of the electrical vocabulary. The definitions are, as a rule, very satisfactory, being both clear and concise. There are exceptions, and we may—since the critic must be critical—cite the definitions of *hysteresis* in the supplement, neither of which would give to a person not very familiar with the subject of magnetism any idea of what is meant by the term. The non-electrical part of the work is the most defective; thus we find under the head of "grammeatom" the strange statement that the grammeatom represents the number of calories (or units of heat) required to raise the temperature of the substance through 1° C. A calorimeter is defined as "an instrument for measuring the quantity of heat *possessed* by a given weight or volume of a body at a given temperature." Now we do not know, and perhaps never shall know, what quantity of heat a body contains; but we may usually determine what quantity of heat it is necessary to add to a body in order to raise its temperature a given number of degrees. It is rather startling, under the head of coefficients of linear expansion, to find the antiquated table of Lavoisier and Laplace. Under the head "Equivalent, Chemical," it is stated that the chemical equivalent is different from the atomic weight. Sometimes it is, and sometimes it is not; the statement is misleading. Under the heading "Element, Positive," a table of symbols, equivalents, and specific gravities is given which contains an extraordinary number of numerical errors, and which is simply worthless. On the other hand, the purely electrical and magnetic part of the work is far better, and the book is really interesting and valuable. It is to be hoped that in a second edition the author will correct the errors of the first. The woodcuts are very numerous and excellent.

Essays, Reviews, and Addresses. By James Martineau. Selected and revised by the Author. I. Personal: Political. Longmans, Green & Co. 1890.

THE series of which this volume is the first contemplates only four volumes, but we are not left to conjecture on what principles the selection will be made that can reduce the scattered work of sixty years within such narrow limits: "A few very early essays have been excluded, as too perversely steeped in the spirit of a discarded philosophy; but else, papers have been marked for rejection only where the interest was obsolete or not desirable to revive." It is evident that these canons have been

rigidly applied. It would appear that Dr. Martineau has put his best foot forward, for he is nowhere more successful than in his studies of personal forces in philosophy and religion, and we have twelve such in this volume (three in one article), with three political essays. Three of the personal studies—of Priestley, Channing, and Parker—are in reality three chapters of Unitarian development. Dr. Martineau began as an associationist in psychology and a determinist in morals, but the Priestley essay, written in 1885, shows him already questioning his master's thought. The essay on Channing (1849) contains some severe strictures on American Abolitionists, and they are repeated in "The Slave Empire in the West," a very elaborate article written in 1857. It is their non-political policy that he cannot forgive or understand. The article on Parker was in 1846 a singularly brave response to the radical theology of that much-enduring man. This, with the articles on Priestley and Arnold, was republished in America in a volume selected by Starr King in 1852, and the articles "Comte" and "Personal Influences in Theology: Newman, Coleridge, Carlyle," were republished here with others in 1866; but both volumes have probably long been out of print.

BOOKS OF THE WEEK.

Abbott, Evelyn. Pericles and the Golden Age of Athens. G. P. Putnam's Sons. 50 cents.
Ames, Fisher. A Practical Guide to Whist. Charles Scribner's Sons. 75 cents.
Baldy, Alice M. A Romance of a Spanish Nun. Philadelphia: J. B. Lippincott Co. 50 cents.
Belton, J. D. A Literary Manual of Foreign Quotations. G. P. Putnam's Sons.
Cabin and Plantation Songs as Sung by the Hampton Students. G. P. Putnam's Sons.
Conway, M. D. George Washington's Rules of Civility. U. S. Book Co.
Cox, S. The Book of Ecclesiastes. A. C. Armstrong & Son. $1.50.
Critic. Vol. XIV. The Critic Co.
Essays on Road-Making and Maintenance and Road Laws. Philadelphia: University of Pennsylvania Press.
Goncourt, E. and J. Germinie Lacerteux. Chicago: Laird & Lee.
Gribble, T. G. Preliminary Survey and Estimates. Longmans, Green & Co. $2.25.
Jerome, J. K. Told After Supper. Henry Holt & Co.
Lowe, R. W. Thomas Betterton. Longmans, Green & Co. $1.
Portraits and Photographs: An Album for the People. Charles E. Merrill & Co. $1.
Quain's Elements of Anatomy. 10th ed. Vol. I. Parts 1, 2. Longmans, Green & Co.
Rahl, Gottfried. Gedichte. Leipzig: Albert Möller.
Reid, W. T. Life, Letters and Friendships of Richard Monckton Milnes. 2 vols. Cassell Publishing Co. $5.
Reunited: A Story of the Civil War. Robert Bonner's Sons.
Scott, E. The Eclogues of Calpurnius. London: George Bell & Sons.
Smith, G. Canada First. Toronto: Hunter, Rose & Co.
Sommers, Lillian. Jerome Leaster. Chicago: Charles H. Sergel & Co.
Southworth, Mrs. E. Lilith. Robert Bonner's Sons.
Squier, E. G. Adventures on the Mosquito Shore. Worthington Co.
Steele, G. M. Rudimentary Economics. Leach, Shewell & Sanborn.
Stephen, L. Dictionary of National Biography. Vol. XXV. Macmillan & Co. $3.75.
Stephens, Ann S. Married in Haste. Philadelphia: T. B. Peterson & Brothers. 25 cents.
Stevens's Facsimiles of Manuscripts in European Archives relating to America, 1773–83. Vol. VI. London: B. F. Stevens.

Fine Arts.

WATER-COLORS AND ETCHINGS AT THE ACADEMY.

THE twenty-fourth annual exhibition of the American Water-Color Society, held this year as usual in the galleries of the National Academy of Design, is quite as good an exhibition as any of its predecessors. It is without the customary two or three striking works that in former years we have sometimes felt compelled to mention as the *clous* of the exhibition, such works as Mr. Abbey, or Mr. Weir, or Mr. Homer have contributed; but the average is excellent. There are 661 pictures, a very large number of works for any exhibition, and it is something to be able to say that there are not many bad pictures. Another fact to be noted is that there is more of what may be called pure water-color work in this exhibition than ever before, and this shows that more attention is being given by the painters to this branch of art for its own sake. Not many years ago most of the work in the water-color exhibitions bore the look of having been done in water-color so as to get it into an exhibition that barred out painting in other mediums; most of it was without any particular fitness as to subject for water-color treatment; much of it was evidently mere copying of studies in oil. Now Messrs. Platt, Wiles, Horatio Walker, Hassam, Smedley, Sterner, Ranger, Drake, Mrs. Nicholls, Miss Greatorex, and others may be called water-color painters in the right sense of the word, just as Mr. Homer and Mr. Weir have been for a long time; and each year we find more painters making use of the medium of water-color, because they can express what they wish to depict in a certain way better in that medium than in oil.

Neither Mr. Weir nor Mr. Abbey is among the contributors to this year's exhibition, but Mr. Homer is represented by one drawing. This picture, called "Mending Nets," No. 364, shows two fisher-girls seated on a bench, in profile to the spectator, and the one in front knitting blue-yarn socks. Her right arm is raised in the action of drawing up more yarn from the ball that lies on the floor or pavement beside her, and her head is naturally turned to follow the movement of the hand. The other figure is bent over, intent on the work of mending a large net which is hung on the wall to the right of the picture. Both figures are admirable in movement and in character, and the group is composed with that large, fine feeling for great lines that we find in Mr. Homer's best work. That we find it very good, but not quite so good as some of his other pictures, is because, though excellent in composition and character, it is not quite complete. The group in itself is admirable, but it is hard to make out just what is meant by the background. The figures seem to be in the open air, but the white expanse behind them, though it seems to be a plaster wall, might also be taken for sky. We judge the work merely by Mr. Homer's own high standard, and if it does not in all respects quite come up to that, it is none the less one of the most individual and able drawings in the exhibition.

Simply washed and in general frankly treated, is the head of a "Dutch Girl," No. 214, by Albert E. Sterner, and very much colored are two other drawings by the same artist, "Lady Maude," No. 65, and "Before Dinner," No. 273. Very frank and very clever, too, is the "Study," No. 370, by Eleanor E. Greatorex, which shows an old woman under an umbrella; and an artistic little figure notable for good treatment of blacks is "Sketch," No. 434, by Frank Fowler. Mr. Wiles, who handles water-color with the most delightful skill, is well represented by three pictures, of which the one called "With Thoughts Afar," No. 409, is not quite so satisfactory as it would be if there were more body in the figure of the young woman in a red gown who lies on a pile of green-plush cushions on a sofa, with a piece of red-and-gold embroidered stuff hanging on the wall behind her. "The Débutante," No. 349, a single figure of a young girl in a green dress with black fur trimming, is much more solid, and in "A Hothouse Flower," No. 38, we find, along with infinite skill in painting and much charm of color, another young woman, seated on the steps of a greenhouse this time, who is as picturesque as either of the others, and the centre of a composition that is complete enough in all its parts to make a satisfactory and pleasing picture. Mr. Hassam, whose work seems a trifle "mannered" in his large drawing, "Fifth Avenue," No. 466, in that the blacks are forced up to a high key and turned to blue, though the effect of air is very well rendered and the numerous figures in the street scene are effectively composed, is seen at his best in the bright, quickly painted study in sunlight, "A Street in Gloucester," No. 75; and Mrs. Nicholls, with a picture called "The Chrysanthemum Season," No. 569, gives a truthful rendering of an outdoor motive painted in the simplest fashion with notable cleverness. Mr. Tiffany shows a large sheet, "Potters' Market on the Quay at Wurtzburg," No. 579, that is bright and airy and possesses serious qualities of color; and Mr. Reinhart in "Summer Girl," No. 114, gives a good single figure of a lady in black, effectively contrasted with the old-gold and yellow tones of the walls of a room in which she is shown seated on a settle with a railed back.

The smaller of Mr. Horatio Walker's two contributions, "A Pastoral," No. 14, a bit of gray landscape with a woman milking a cow, is very good and charmingly painted, but the larger one, "Evening," No. 385, which represents a man going home through the fields with his ox, seems a trifle vague. It is a drawing of much character, however, and evidently the work of a hand that is sure of itself. What it lacks is solidity more than anything else, and if that were more felt there would be little to find fault with, for it is a fine piece of color. Mr. Chase makes one of the most striking pictures in the exhibition out of a simple half-length portrait of a lady in black painted entirely in *gouache*—a brilliant and luminous head with strong painting in the costume; and Mr. Smedley, who also elects to paint in body-color mostly, contributes an excellent figure of a young woman in pink seated before a cheval-glass, "If Roses Fade," No. 334. Good interiors with figures are shown by Stanley Middleton, "A Visit to the Studio," No. 410; by Ralph E. Clarkson, "A New York Studio," No. 404; and by Frank Russell Green, "An Evening Melody," No. 226. "Two Strings to Her Bow," No. 265, is a picture by Léon Moran of two young gallants and a pretty girl; a nice composition and cleverly handled. "The Return of Spring," No. 339, by Arthur Parton, a well-painted landscape, with a figure of a man sowing seed in a freshly-ploughed and harrowed field, and a pretty picture of a Dutch boy with a young lamb in his arms and another standing on the grass at his side, "Friends," No. 374, by Clark Crum, are two scenes of country life to be mentioned for their excellence, and with these may be noted "Un Appel," No. 247, and "Forenoon," No. 259, by Aug. Franzén, both works of good size with landscape and figures, and both brilliant and effective.

In pure landscape there is nothing better in the exhibition than "Spring Flood," No. 448, by Charles A. Platt, a charming picture painted in pale grays and greens, though "Winter—Central Park," No. 71, by D. W. Tryon, a soberly treated effect of snow in the park, with the upper part of the city lying low down to the horizon beyond, is as good in its own direction as it well could be. "After the Rain," No. 34, by H. Bolton Jones; "Evening," No. 351, by Bruce Crane; "Shed and Stack," No. 406, by H. W. Ranger; "Hackensack Meadows," No. 129, by C. Harry Eaton; "Outskirts of the Forest," No. 101, by Edward Moran; and "A Silvery Night," No. 117, by Leonard Ochtman, are a few landscapes among the many good ones here that are especially worthy of mention. "Autumn Evening," No. 193, by one of the best of the Dutch water-color painters, V. B. von Tholen, shows how admirable the work of the modern Dutch school is when we can find an example of the best work of the painters that belong to it.

The exhibition of the New York Etching Club is held in the corridor, and is an excellent one. Mr. Platt's beautiful work, Mr. Pennell's street scenes in London, Mr. Bacher's in Venice, Mr. Weir's three portraits, Miss Armstrong's genre subjects, the landscapes by Mr. Thomas Moran, Mr. H. Bolton Jones, and Mr. T. R. Manley, and Mr. Chapman's marines, are the principal things in the exhibition, and all extremely good; and as much may be said of some street scenes in New York by C. W. Mielatz, a portrait head by James D. Smillie, and an avenue of elms in New Haven by Miss Ellen Oakford. It would be hard to find anywhere etchings by any modern man that are as good in their way as Mr. Platt's work in this exhibition. They rank decidedly with the very best of modern work in Europe, and are certainly the best things he has yet done, though his former plates have been so good as to give him a very high reputation.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 26, 1891.

The Week.

THE free-coinage craze is fast abating. The Wisconsin Legislature on Thursday last passed a resolution opposing the bill for unlimited coinage now pending in Congress. In the Senate the vote in favor of the resolution was unanimous, and in the House only four members recorded themselves in the negative—two Republicans, one Union-Labor man, and one Democrat. To appreciate the significance of this action, it must be remembered that Wisconsin is one of those Western States which have been alleged to be in favor of free coinage without distinction of party, and especially so far as the Democrats are concerned; and that the Democrats control the Legislature by a working majority in the Senate and by a two-thirds vote in the House. When all but one of the Democrats in a Western Legislature vote against free coinage, it is high time to stop the silly talk about the Western Democrats being in favor of free coinage.

It is evident that there has been almost as gross exaggeration of the extent of the free-coinage sentiment in the South as in the West. The Memphis *Appeal-Avalanche* had been of the opinion that the Democrats of Tennessee were earnestly in favor of free coinage, but the other day it conceived the happy idea of finding out exactly what people thought about it by sending reporters to ask citizens in various walks of life these three questions:

(1.) Do you think the free coinage of silver essential to the welfare of the South?
(2.) Does the question excite much discussion; if so, what is the tenor of opinion?
(3.) Do you think it ought to be made a party issue?

Between forty and fifty persons were interviewed—grocers, shoe-dealers, dry-goods men, produce-dealers, cotton-factors, etc.—and a decided majority pronounced themselves emphatically against free coinage. No less significant were the answers to the second question, most of which ran like these: "The masses of the people do not care anything whatever about it"; "The politicians are the only people who care anything about free coinage"; "I don't hear anybody talking about it"; "The people know and care little about it"; "Nobody seems to think it of much importance." The third question was answered almost unanimously in the negative.

Such developments as these indicate that free coinage will be much weaker in the next Congress than in the present one. It is already evident that the scheme is dead so far as this Congress is concerned, the most sanguine silver-men no longer having any hope that the Senate bill will pass the House before the 4th of March. The way public sentiment is now running, such a bill is not likely to be as strong next winter as it is this. A large part of its support has come from Senators and Representatives who care nothing about the matter one way or the other, but who voted yea, as the delegation from Tennessee did, because they had been assured that everybody in Tennessee was "red hot" for free coinage. Let it become clear that the people are not demanding free coinage, and the politicians will drop the scheme like a hot potato.

The Merchants' Exchange of Buffalo, on the 9th inst., in passing resolutions against the free coinage of silver, rose to the full height of the occasion by demanding also *the repeal of the present silver law*, the act of July 14, 1890. This is really "taking the bull by the horns," and it is what we must come to soon or late. We cannot go on for ever buying four and a half million ounces of silver every month. It is sheer waste of the taxpayers' money. The Treasury cannot stand it. We shall presently be driven to the expedient of selling bonds, *i. e.*, increasing the public debt, to pay for this useless silver. The statutes contemplate this very exigency, giving the Secretary power to sell bonds to keep his gold reserve good. When he comes to put this expedient in practice, there will be plenty of Merchants' Exchanges all over the country of the same mind as that of Buffalo.

One of the last witnesses listened to by the House Committee on Coinage was William H. Beck of Montana, a gentleman engaged in silver-mining. Mr. Beck's head was "level." He said that he was opposed to free coinage of silver, "on the ground that the present law, which took fifty-four millions of silver annually out of the market and absolutely locked it up, was a better thing for the silver-miner than free coinage, under which all the silver would be on the market." The report of Mr. Beck's lucid testimony continues thus:

"He did not think free-coinage legislation alone could raise the price of silver bullion to its coin value. Mr. Beck gave it as his opinion that free coinage would absolutely destroy the exchangeability between gold and silver, and would make silver, whether in the shape of coin or bullion, worth simply the bullion value in the markets of the world. Under free coinage the American silver coin would be just as much a commodity as the coins of Mexico, which had free coinage, and the purchasing power of silver coin would be simply its bullion value, as fixed in the markets of the world. The number of low-grade silver-ore mines, he declared, was absolutely illimitable, and with the greatly improved methods in production there would be great quantities of silver put on the market. There had been such great improvements in mining that he believed that within five years silver would get down to eighty cents an ounce. He was sorry to see it, but believed it would have to come. Mexico was also greatly increasing her productions. He read a letter from ex-Gov. White of Montana, expressing gratification at the fact that free coinage could not pass this Congress, and declaring that free coinage would be a great disaster to the silver industry. The sentiment of the people, the letter said, was changing. If Congress were to pass a free-coinage law, he insisted that it should be provided that gold dollars could be exchanged at the Treasury for silver dollars, and vice-versa, and that if either metal went up or down, the Government should stand in the breach and bear the loss."

Mr. Beck's testimony fell short in only one respect. He did not tell us how long the Government could continue taking fifty-four million ounces of silver out of the market and locking it up, or what would be the eventual destination of the mass.

Said Mr. Bartine, at the hearing before the Coinage Committee the other day:

"Suppose the people had twice as much currency in their pockets as now, would not their prosperity be greatly increased?"

Now, why does not some one get Mr. Bartine into a private room, away from disturbing influences, and ask him soberly to explain how people get any amount of currency "into their pockets"—how he himself gets it into his pockets, for instance? It is these vague, unchecked generalities which are just now making most of our trouble. There are only three ways known to the human race (excluding gifts and miracles) of getting currency into a man's pocket: (1) the sale of something for cash, (2) borrowing, (3) plunder. If currency was as plenty as carpet-tacks, there would only be these three ways of coming by it. If it were as plenty as carpet-tacks, it would of course have no more value in one man's pockets than another. Now, suppose the Government were to "issue" to-morrow any quantity that the wildest silver or paper-man thinks we need "per capita," how would the people get hold of it? The Government, of course, could not give it away to all comers, because in that case it would have no value for anybody—that is, no purchasing power. It could only put it in circulation by paying its own debts with it and by buying something with it. This would put it into the pockets of two small classes only, namely, those to whom the Government owed some money, its employees and bondholders and pensioners, and those from whom it buys goods. But it pays out all the money to these classes now which it would pay then, and no more of this money would get into "the pockets of the people" then than now. Plunder we may rule out, as it is an expedient which could not increase the prosperity of a whole people. Borrow we cannot without security, and if we have security, we do not, as a rule, need to borrow: we prosper without it. So that we are left to rely on the sale of commodities as the only means of getting currency into the pockets of the people, no matter how plenty it may be. It is very sad, of course, to know that to get money we must part with something we have already; but so it is, so it has been from the beginning, and so it will be till the end.

Congressman Sweet of Idaho has introduced a resolution which recites that certain national banks are refusing to lend money

except upon contracts payable in gold, "which course tends to discredit the currency of the country whether based on gold or on silver." Therefore (the resolution provides) any national bank thus attempting to degrade the currency of the country shall forfeit its charter. The resolution is probably aimed at the banks of California, which habitually and invariably make their loans payable in gold, a practice which was shamelessly incited by Congress twenty-one years ago in an act providing for the establishment of gold banks. This act even went so far as to authorize the issue of circulating notes payable in gold, and required the banks issuing them to keep on hand not less than 25 per cent. of such note issues in gold *or silver* coin—silver coin being at that time worth 3 per cent. more than gold coin. The act was passed expressly in order to bring the Pacific "slopers" into the national-bank system. It is time that such aristocratic practices should come to an end, and it is fitting that a "sloper" should lead the way to a more democratic system of banking. But why should Congressman Sweet limit his resolution to bankers? He ought at least to bring liquor-dealers within the scope of his measure. That these people are falling into unpatriotic ways becomes painfully evident from the terms of the following circular that has just been issued:

OFFICE OF THE
WINE AND SPIRIT TRADERS' SOCIETY,
NEW YORK, February 18, 1891.

DEAR SIR: You are respectfully informed that the following resolution was adopted at the last meeting of the Council of this Society:

Resolved, That in view of the pending legislation regarding the free coinage of silver, this Council recommends that such importers of wines and spirits as have not already done so place upon their billheads the words: "Payable in gold coin or its equivalent in United States currency."

I am, sir, very respectfully yours,
CHARLES McK. LEOSER, President.

We do not perceive any necessary connection between a high tariff and the free coinage of silver, but Mr. McKinley and the organ of the Manufacturers' Club of Philadelphia furnish grounds for thinking that the two things go together. We have published what Mr. McKinley said at Toledo about those unpatriotic persons who go about "dishonoring one of our precious metals, *one of our own great products*, discrediting silver and enhancing the price of gold." The *Manufacturer* of February 15 has two articles in the same vein as McKinley's speech. It does not advocate free coinage outright, but it answers a series of questions put to it by a correspondent who is opposed to free coinage, using the arguments common to the free-coinage party. Probably there is a fellow-feeling among all those who want the Government to help them in their business, such as the protected manufacturers, the silver-mine owners, and the steamship-subsidy men. When McKinley lays stress on "one of our own great products," he means that the Government ought to buy enough silver, or compel the public to buy enough, to make good times among those who produce silver. Probably the *Manufacturer* takes the same side, on the familiar principle of "You tickle me and I tickle you."

The appointment of ex-Gov. Chas. Foster of Ohio as the successor of Mr. Windom in the Treasury Department is very well received by the country, not because Mr. Foster is widely known as a financier, but because he is accounted a man of affairs and of good sense. He has had sufficient prominence in public life to be acceptable to his own party and not unacceptable to his political opponents. He has had sufficient experience to avoid hasty and ill-advised action. He comes from a State which is now, whatever it may have been in times past, conservative in its views of currency and finance. As regards the silver question, it is safe to say that Secretary Foster will follow in the footsteps of Secretary Windom, and that he will never diverge much, if at all, from the policy of Senator Sherman — not that he is a follower or adherent of Mr. Sherman in the political sense, but because Mr. Sherman is known to be a master of the science of finance, while Mr. Foster is not.

Congress has at last performed a long-neglected duty by passing a bill increasing the salaries of United States District Court Judges to $5,000 a year. The only criticism to be made is that the increase is too small, and that the uniformity of the salary hereafter to be paid perpetuates the injustice from which many of these judges have long suffered. It is, of course, obvious that the expense of maintaining a family in the manner rightly to be expected of a judge of a Federal court is far smaller in a little town of an agricultural State in the South or West than in one of the great cities of the country, and consequently that while $5,000 might be ample salary for one of the former class, it would be utterly inadequate for the latter. The existing system, indeed, has recognized, though in a rude and somewhat inconsistent manner, the inequalities of a uniform salary for men living under circumstances so very different, and allowed $4,000, $4,500, and in one case $5,000 to some, but not all, judges living in the larger cities, while giving only $3,500 to the great majority. The Judiciary Committee of the House were inclined to maintain this principle of discrimination, but, rather than risk the entire failure of the measure, concluded to advise concurrence in the bill which had passed the Senate, giving all of the judges $5,000 a year. This was doubtless the wisest outcome of the situation possible, and it will do something to relieve the condition of faithful officials, like the Judge in St. Louis, for example, who has never received more than $3,500, and who testified that his salary was entirely inadequate to pay his current expenses, although he lived in a modest house in a retired quarter of the city.

It is said in Washington that when the present session of Congress comes to its end, there will be an omission of the usual resolution of thanks to the Speaker for his courtesy and impartiality. It has been the unbroken practice, since the early days of the Government, for a member of the Opposition to propose such a resolution and for it to be passed with little or no opposition. There were murmurs of discontent with the practice when Speaker Keifer's term drew to a close, many Democratic members feeling natural qualms about formally eulogizing a man for whom they had so little respect; but it was finally agreed to preserve the precedent, and he was thanked in the usual manner, with only eight dissenting votes. In regard to Speaker Reed, the Democrats are a unit in believing that his course in the chair has been so completely a new departure that they will be justified in making another. They say that since he has boasted that he has, by his defiance of parliamentary procedure, "set the precedent for a hundred years," they will imitate his example, and break the precedent of a hundred years in regard to thanking him for his conduct. They not only refuse to introduce the resolution of thanks, but declare that they will, if one be presented, offer a substitute giving their real opinion of his course, and thus make it necessary for both to be spread upon the record for all time. No one who has followed the course of the Speaker in the chair during the two sessions of this Congress can do aught else than commend the Democratic position. It would be simple stultification for them to commend the "courtesy and impartiality" of a Speaker who has never shown a particle of either of those qualities, but who has sat in the chair like a Sultan, defying all precedent, and covering every member who questioned the propriety or justice of his course with insults. He ought to be allowed to leave the chair he has disgraced without a word of respect from any source.

Speaker Reed seems to have been in "great form" on Friday. He jeered members who questioned the justice of his rulings, using the chair of the House as if it were a stool in the centre of a bar-room, or a high point on the stairway of a tenement-house during a row among the occupants. He performed great exploits also in the way of counting a quorum, not contenting himself with merely counting members who were within the reach of his eyes, but counting those whom the clerks reported as having been found by them in the cloak-rooms. This is making great progress in parliamentary procedure. There is only one more extreme to which he can go, and that is to count as present in the House every member who is known to be in Washington at the time. He counted a member as present on Friday who was in a barber-shop being shaved at the time, and that was no greater stretch of the Speaker's powers than it would be to count a member as present who was in bed in his hotel or eating his dinner in its dining-room. The world has never seen such a wonderful Speaker as our Czar, and as he has only a few days more in which to display his resources, he

ought not to allow himself to be hampered by anything.

The Territory of Dakota was made into two States with the expectation that they would furnish four Republican Senators who could be trusted to vote for high tariffs every time. When a high-tariff bill came before the Senate during the first Congress that the Dakotas were represented in, one of the Senators from South Dakota voted against it. The other Senator voted for it, and he has just been beaten for reëlection by an Independent who declared himself strongly for a low tariff. Both of the North Dakota Senators voted for the McKinley Bill. One of them has been beaten for reëlection by a Republican who is committed to a low tariff. It is, therefore, already certain that three of the four Senators from the Dakotas in the Fifty-second Congress will vote for low tariffs, and it is not at all unlikely that the fourth will take warning from the fate of his associates and record himself on the same side. Instead, therefore, of securing four votes for McKinley bills by admitting these two new States, the Republicans have succeeded in giving the tariff-reformers three votes, if not, indeed, all of the four.

The question has been raised whether the new Senator Kyle of South Dakota is eligible to his seat, the statement being made that he is not a "resident" of that State. The Constitution of the United States does not require that a man shall be a "resident" of a State in order to be its Senator. It requires that he shall be an "inhabitant" of the State. The first draft of that particular clause in the Constitution used the word resident. It was stricken out and the word inhabitant substituted, because it is not easy to determine residence but is easy to determine inhabitancy. A man's residence may be determinable only in his own mind. His inhabitancy is a physical fact ascertainable by eyesight. When Gen. Adelbert Ames, an army officer stationed in Mississippi, was elected Senator from that State, his credentials were questioned, and the Senate Committee to whom they were referred reported that he was not entitled to his seat, as not being a resident of the State. The Senate overruled the Committee and seated Mr. Ames, on the ground that, although not a resident, he was an inhabitant. In another and earlier case a citizen of Massachusetts who was holding a clerkship in the State Department at Washington was elected to Congress, but his credentials were rejected and the seat declared vacant, because, although he was a resident, he was not an inhabitant of the State at the time when he was voted for. As there is no doubt about Mr. Kyle being an inhabitant of South Dakota, there is no doubt about his being entitled to the seat for which he has been chosen.

The Republicans in the Illinois Legislature have fallen under very bad leadership when they abandon their caucus nominee for the Senate and cast their votes for the candidate of the F. M. B. A. To elect the latter they must bring every vote they have in the joint convention, and this is hardly possible. But supposing that they could do this and elect Streeter, the effect upon the party would be disastrous and demoralizing. The bonds of discipline would be loosened to a disastrous degree; nobody would be bound by a caucus nomination hereafter. More than that, the party would have humbled itself by sending to the Senate a man objectionable to the intelligence of the State. Streeter is just the same kind of man as the new Kansas Senator Peffer. The case is very different from that which was presented in 1877, when the Democrats joined the so-called Labor Reformers and elected David Davis to the Senate. Judge Davis was a man of wide reputation, a member of the United States Supreme Court, the intimate friend of Abraham Lincoln and the executor of his last will and testament. To elect such a man was not to lower the dignity of the State, as it certainly would be to elect Streeter. If the Republican members of the Legislature have been persuaded that they can thus trifle with the work set before them, they have been very badly advised.

We wonder what Mr. McKinley will do with the petition to Congress intrusted to his care by citizens of his own State, the Spring Lake Ice Company of Toledo, who "confidently rely" on his "efforts to further the interests of an industry employing many thousands of Americans. . . . Appreciating the great efforts you have made in behalf of other industries, and confidently believing that the American people will show a proper appreciation thereof, we ask a similar action for ourselves." The purpose of this application, signed by L. J. Seek, President, who certainly is well named if his petition be serious, is to ask "protection" from products of the pauper frost of Canada. Says Mr. Seek:

> "The American market, which ought to be reserved to Americans, is in danger of being flooded with cheap Canadian ice, contrary to the principles of protection, and to the great injury of American industries and American labor. . . . We respectfully submit to your honorable body that we and all others in the ice business are obliged, on account of the existing tariff law, to buy our tools, implements and lumber of Americans; while they, on the other hand, are allowed to buy their ice of Canadians, with their cheap labor and long winters, which put us at a great disadvantage. This is manifestly unjust and unequal, and we are obliged to conclude that unless we are put on the same plane with others, we shall have, however reluctantly, to oppose the continuance of the tariff duties on the articles which we buy. If others are to have the benefit, such as it is, of cheap foreign stuff, we want it too."

We shall not disguise our suspicion that the Toledo petition may be designed as a "grind" on Mr. McKinley, in which case it is "admirable fooling"; but it is not intrinsically more foolish than most of those which have been answered by the McKinley Act of Congress.

Important tariff reforms have been proposed in both Denmark and Sweden, and there is a strong probability that the bills embodying them will be passed. The Danish measure, which has already reached the third discussion in the lower house, provides for free sugar and for the removal of the tariff from several other necessaries. The bill was passed on the second discussion by a considerable majority, and unless the upper house refuse its sanction, the present Parliament will be able to congratulate itself on at least one good thing accomplished. The Swedish proposal is of the same nature as the Danish, differing from the latter in being more comprehensive. It provides for the reduction or removal of the tariff on the necessaries of life. The Committee of the Rigsdag having the matter in hand have determined, by a vote of 10 to 9, to take it up as soon as possible, the minority voting for a postponement. A similar measure has been recommended by the leaders of the Liberal party in Norway. These misguided foreigners are evidently bent on making themselves as cheap as possible, instead of profiting by the example of our own glorious Republic.

It was not to be expected that the irreconcilable Royalists in France would receive with loud cheers Cardinal Lavigerie's announcement that the monarchy was dead, and that henceforth the Church would do well to cast in her lot with the Republic. Outcries and wailings were to be looked for from all sides, and they came. But very soon adhesions to the Cardinal's programme began to be announced, some of them truly remarkable. First came a number of bishops, of whom Mgr. Isoard was the chief; then MM. Cassagnac and Eugène Veuillot; then the newspapers in a stream—the Clerical *Monde* and the long faithful *Univers* at their head. Half the Royalist camp, at least, went over. Even the *Autorité* and the *Gazette de France* ceased their opposition. The irreconcilables had appealed to Rome at the outset, and they got but cold comfort there. The Pope ordered a general *quête* for Cardinal Lavigerie's African work. Then Cardinal Rampolla wrote a reply to the complainants, couched in the most delicate language of Roman diplomacy, but conveying a distinct rebuff; and, last of all (if we may trust a report in the *Figaro* which the *Temps* also seems to consider authentic) the Holy Father has himself spoken in terms of high approval of the Archbishop of Algiers' position. The Pope, indeed, is even less "clerical" than the Cardinal, for he considers a purely clerical party in France, which Lavigerie desires and hopes for, to be no more than a dream. For all this, the Faubourg irreconcilable does not stir an inch. He continues to curse the Republic—*la gueuse* is the nice name he calls her by—and to cry out at the clergy and Bishops, and, at last accounts, he was writing letters to the *Figaro*, to show how necessary it is sometimes to oppose authority for authority's own sake, and how easily a Pope may fall into the dreadful sin of schism. Altogether he makes a distinct contribution to œcumenical gayety.

WHAT THE BARRUNDIA CASE CALLS FOR.

MR. DALZELL, in his speech on the Barrundia affair, brought out some new features, which seem to impose on him the obligation, since he has taken the matter up at all, of not letting it rest until either justice has been done or his powers of seeking justice have been exhausted. That is to say, he has apparently proved the Secretary of the Navy to have been guilty, in his treatment of Commander Reiter, not only of unfairness and want of consideration, but of a positive violation of the law, to the great injury of a defenceless man. This offence, committed by an officer in Secretary Tracy's place, ought not to be passed over. No man in America is above the law. Any member of Congress, as it seems to us, who has deemed it important enough to present or hear a long argument on it before the grand inquest of the nation, ought not to drop it until the wrong has either been righted or has been shown to be irremediable. If Secretary Tracy's conduct has been what Mr. Dalzell says it has, it should be passed upon by some tribunal or other, not simply for Commander Reiter's deliverance, but for the erasure from the records of the Department of a most mischievous precedent.

Mr. Dalzell, in his letter printed in the *Evening Post* on Monday week, maintains that the publicity of the reprimand administered to Commander Reiter made it illegal. He denies the Secretary's power to administer a public reprimand at all in time of peace. He shows that one of the Naval Regulations says: "The authority to punish offences being strictly defined by law, no deviation from the limits prescribed will be tolerated." He shows that not one of the precedents cited by Mr. Lodge was applicable to Reiter's case—that is, that not one of them justified a public reprimand by the Secretary as a punishment in time of peace without the intervention of a court-martial. There is no provision in the Naval Regulations for the infliction of a public reprimand by any authority but a court martial, and one of them forbids "superiors of every grade to injure those under their command by tyrannical or capricious conduct, or by abusive language."

It has further appeared that the Secretary is unable to produce any statute, regulation, or precedent of international or municipal law which Commander Reiter disobeyed or disregarded in failing to rescue or shield Barrundia from the Guatemalan police, or to point to any act on the part of the Guatemalan Government with regard to Barrundia which Commander Reiter would have been justified in resisting by force, or for which Secretary Blaine could now lawfully demand satisfaction. In other words, the attempt to show that Barrundia had, by virtue of his status on board the *Acapulco*, in the harbor of San José, any claim, either moral or legal, on the protection of the American flag, has wholly failed. Mr. Lodge was compelled to rely, in dealing with this portion of his case, on general considerations of humanity and patriotism, which, however, he destroyed or greatly weakened by admitting the badness of Barrundia's character—that is, his unworthiness of any special or extraordinary display of naval boldness or "chivalry" in his behalf by a foreign Government.

It further appears that not only has the Secretary proved unable to produce any recognized law or regulation for Commander Reiter's condemnation, but he has, through Mr. Lodge, attempted to concoct one of his own *ad hoc*, compelling naval commanders not only to offer asylum on board their ships to political refugees, but even to go in search of them on the open sea for the purpose of forcing it on them. Commander Reiter was actually reprimanded for not having gone out to sea to meet Barrundia and invite him on board the American man-of-war. Mr. Lodge's attempt to produce some sort of authority for this strange doctrine was one of the oddest features of the debate. He quotes in support of it as follows from Hall's 'International Law':

> Hall's 'International Law,' third edition, 1890, pages 192 and 193, says:
> "Thus, to illustrate some of the foregoing doctrines, under the general rules of respect for the laws of a State it is wrong for a ship of war to harbor a criminal or a person charged with non-political crimes. If, however, such a person succeeds in getting on board, and is afforded refuge, he cannot be taken out of the vessel. No entry can be made upon her for any purpose whatever. His surrender, which is required by due respect for the territorial law, must be obtained diplomatically. In like manner, if an offence is committed on board which takes effect externally, and the captain refuses to make reparation—if, for example, he were to refuse to give up or to punish a person who, while within the vessel, had shot another person outside—application for redress must be made to the Government to which the ship belongs.
> "If, on the other hand, the captain of a vessel were to allow political refugees to maintain communication with the shore and to make the ship a focus of intrigue, or if he were to send a party of marines to arrest a deserter, an extreme case would arise, in which the imminence of danger in the one instance, and in the other the disregard of the sovereign rights of the State, would justify the exceptional measure of expulsion. The case is again different if a political refugee is granted simple hospitality. The right to protect him has been acquired by custom."
> Hall goes on to say:
> "He [the fugitive] should not be sought out or invited, but if he appears at the side of the ship and asks admittance, he need not be turned away."
> This refers to political fugitives escaping from the shore. They ought not to be sought out or invited. But the case is very different with a political fugitive who is in territorial waters only by reason of the fact that he has taken passage in an American steamer in the territory of another State with a destination for another port in the territory of a third party.

Now it seems hardly credible, but it is a fact, that there is not one word in Hall to justify the remark that "this refers to political fugitives escaping from the shore," or that "the case is very different with a political fugitive who is in the territorial waters only by reason of the fact that he has taken a passage in an American steamer," etc. Hall gives no countenance either by mention or innuendo to any such distinction. It is a pure figment of Mr. Lodge's imagination, and yet he appends it as if by reading a little further we should find it fully set forth in Hall's text. There is no authority anywhere which releases naval officers from the obligation to wait until they are asked before granting any asylum on board public ships to political refugees. To allow them, and still more to instruct them, under penalties, as in Commander Reiter's case, to cruise for such refugees in order to proffer them the shelter of the flag, might, as may easily be seen, lead to monstrous abuses, and might, indeed, in many cases lay naval officers open to the charge of interfering in local conflicts by guaranteeing beforehand the safety of the defeated party. The rule is, that, no matter from what quarter or by what means the refugee may reach the ship, an application on his part is an essential condition of his reception. Barrundia made no such application. He entered the harbor knowingly. He refused to see Commander Reiter when he called on him, and apparently had determined from the first to rely on his revolver for safety or revenge. In truth, the suggestion of a writer in the *Herald*, that if Reiter had taken him on board his ship under the circumstances, he (Barrundia) would have had his action for false imprisonment, is by no means fantastic.

"PER CAPITA."

THE old lady who got so much comfort out of "that blessed word Mesopotamia" would, if she were living in our day, get twice as much out of the phrase "per capita." Indeed, we know of no term in either the Latin or the English tongue which has relieved so much depression and excited so much hope of a better day as this one. It has increased the joys and reduced the anxieties of hundreds of thousands. When any great trouble comes on them in the shape, say, of a note to pay, or a tax to bear, which they find it difficult to meet, they simply take the "per capita" view of it, and all its terrors vanish. For example, that famous joke of Mr. Evarts, which showed that $100,000,000 of taxation, even if unnecessary, only imposed a burden of three cents per week on each person, was a strictly "per capita" joke. It would have fallen utterly flat if he had not been able to say "per capita."

But, on the other hand, nothing does so much to create a feeling of "shortness" in the matter of money as "per capita." When the money of the country, for instance, has the "per capita" principle applied to it, it nearly unhinges the agricultural mind. Many an honest and industrious farmer has led a prosperous and reasonably contented life, and always thought there was money enough until he heard how much money there was "per capita." He always found that when he had anything to sell, he was able to get the market price for it in cash, and when he wished to borrow, was always able to get his loan from the banker in cash if he could satisfy him that he would repay it on a day named. But as soon as he began to hear that we had only $23 of currency "per capita," he began to feel that ruin stared him in the face. Had he been told that all the money in the country divided among the population would only give each person $23, he would

not have minded it a bit. It would have produced no more effect on him than those arithmetical exercises which show how many $5 gold-pieces it would take to cover a ten-acre lot, or how many greenbacks it would take to paper the walls of the Capitol at Washington in a neat and tasteful manner. "What difference does it make," he would say, "when we know the money is not going to be divided among the whole population?" But when told by economists in whom he has confidence, that we have only $23 of currency "per capita," he becomes wild with anxiety. "Per capita!" he exclaims—"ah, that is a very different thing. What is to be done? I had no idea that our 'per capita' condition was anything like that. Why, we are sitting over a volcano! God help the poor! It is the gold-bugs and Wall Street speculators that have brought us to this. They have known all along how we were situated 'per capita,' and yet they have concealed it from us." In fact, there appears to be no sort of doubt that a people may flourish greatly and be very happy if they divide the good things of life per head, and yet sink into wretchedness under the "per-capita" system.

It is but fair to add that the discontent excited by "per capita" has been greatly aggravated by the fuss which is made in moneyed circles about collaterals. There is a gentleman named D. P. Hadden in Memphis, Tenn., who in a recent interview "voiced" the popular sentiment in many parts of the West and Southwest on this subject:

"I am in favor of more currency. We haven't enough currency per capita to do the business of the country. If we cannot increase the currency, I think somebody ought to issue more collaterals. There is usually enough money if a man has the collateral."

Nothing so much tends to increase the alarm caused by our "per capita" condition as this morbid craving of money-lenders for collaterals. Many a man could reconcile himself perfectly to $23 "per capita" of currency if it were not for the persistence of the banks, as at present managed, in seeking collaterals when they make loans. Mr. Hadden's suggestion, therefore, may be considered in the highest degree conservative. He does not insist, as so many others do, on increasing our currency per capita. He recognizes the fact that the trouble may possibly not lie in the small amount of per-capita currency at all; that we could get along perfectly with $23 per capita if we had a more abundant supply of collaterals, and he suggests that somebody should make as many collaterals as are needed to bring loans within the reach of the humblest.

Is there not in this suggestion—crude as some may think it—the groundwork of a compromise between the West and the East on the currency question? Is it not probable that if the West were allowed to have its way in the matter of collaterals, the East might have its way in the matter of currency? If there be plenty of collaterals per capita, who will complain if currency be short per capita? No people has ever lost its liberties which had plenty of collaterals. In fact, we venture to assert that collaterals are more important than currency, for, if you have the collaterals, currency will be speedily added unto you. We, therefore, most heartily favor Mr. Hadden's plan of solving the currency question by an abundant issue of collaterals. His suggestion may fairly be called an "eirenikon"—a way to peace between two now discordant sections of the country. We would stuff the banks with collaterals until they cried, "Hold! enough," and until loans were as per-capita as currency itself.

THE MASSACHUSETTS CENSUS.

As the following table will show, the increase in the population of Massachusetts between 1880 and 1890 has been absolutely greater than in any previous decade, and relatively greater than in any preceding census period except that between 1840 and 1850:

Census of	Population.	Increase.	Per cent. of Increase.
1890.....	2,238,943	455,858	25.6
1880.....	1,783,085	325,734	22.3
1870.....	1,457,351	226,285	18.3
1860.....	1,231,066	236,552	23.7
1850.....	994,514	256,814	34.8
1840.....	737,700	127,292	20.8
1830.....	610,408	87,121	16.6
1820.....	523,287	51,247	10.8
1810.....	472,040	49,195	11.6
1800.....	422,845	44,058	11.6
1790.....	378,787		

Rapid as this growth has been, it has not been general; and of the 345 cities and towns existing in 1880, no less than 151, or three-sevenths of the whole number, show a decrease as compared with that year, even after allowance is made for any loss occasioned by the change of boundaries. As we recently demonstrated to be the case in New Hampshire, the decrease in Massachusetts is almost entirely in the smaller towns.

Out of 57 towns and cities which in 1880 had each 5,000 or more inhabitants, 56, if proper allowance be made for territorial changes, show an increase; and only in the town of Westborough in Worcester County has there been a decrease, and in that case the loss is only three-tenths of one per cent. The smaller places in which there has been a loss of population are, as a rule, either agricultural or fishing towns, or towns in which manufacturing is confined to one branch, or a few branches, and from which a depression in those branches compels a portion of the population to migrate in search of employment.

Boston, doubtless because an increasing proportion of the persons whose daily business is carried on within it prefer to reside elsewhere, has not grown as rapidly as the State at large, its percentage of increase having been but 23.60. The cities of the second and third rank, with a population in 1880 of from 20,000 to 100,000, have relatively made the greatest increase, having added more than 40 per cent. to their population during the decade. The cities and towns with from 8,000 to 20,000 inhabitants each have done almost as well, their rate of increase exceeding 36 per cent. The towns with a population of from 4,000 to 8,000 have grown not much more than half as fast, and those with a population of from 2,000 to 4,000 not a fourth as rapidly; the percentage of increase for the former class being nineteen, and for the latter but eight. The still smaller towns have suffered a net loss during the decade, which has fallen most heavily upon the very smallest; the percentage of decrease in the towns from 1,000 to 2,000 inhabitants being nearly 4, and in those of less than 1,000 more than seven and a half.

The 179 least populous towns in the State have less population to-day than they had seventy years ago. The 95 least populous towns have less population than they had in 1800. Some of them, although their boundaries have remained unchanged, have barely more than half the inhabitants they had at the outbreak of the Revolution, and a few of them had a larger population at the close of the French and Indian war than they have to-day. On the other hand, the twenty cities which in 1890 had upwards of 20,000 inhabitants each, have now more than half the people of the State, although 100 years ago these same places contained less than one-sixth of the population. In 1790 Boston was the only place in Massachusetts with upwards of 8,000 inhabitants. To-day there are no fewer than 47 cities and towns with more than that number, containing an aggregate population of 1,564,931. In the whole United States there were as late as 1840 but 44 cities of over 8,000 inhabitants, and their aggregate population was but 1,453,994.

The following table shows in a striking manner how great and how rapid has been the change in the proportion of urban to rural and semi-rural population in Massachusetts in the last century:

Date of Census	No. of cities and towns of over 8,000 inhabitants each.	Population of cities and towns with over 8,000 inhabitants.	Population of towns of less than 8,000 inhabitants.	Percentage of total population residing in cities and towns of over 8,000 inhabitants.	Percentage of total population residing in towns of less than 8,000 inhabitants.
1890...	47	1,564,931	674,012	69.90	30.10
1880...	38	1,107,032	676,053	62.09	37.91
1870...	30	803,267	654,084	55.12	44.88
1860...	23	551,024	585,976	44.76	55.24
1850...	17	375,834	618,680	37.79	62.21
1840...	10	205,994	531,706	27.92	72.08
1830...	3	94,363	516,045	15.46	84.54
1820...	2	71,141	452,146	13.60	86.40
1810...	2	58,566	413,476	12.41	87.59
1800...	2	42,257	380,588	9.99	90.01
1790...	1	23,851	354,936	6.30	93.70

For the first three decades of the nineteenth century, Boston and Salem were the only places with more than 8,000 inhabitants. It was not until 1840 that any towns except

Boston, Salem, and Charlestown passed that number. A century ago more than 93 per cent. of the population resided in towns of less than 8,000 inhabitants. At the time of the Mexican War, when Increase D. O'Phace, Esq., made the speech at the extrumpery caucus in State Street reported by Hosea Biglow, his description of a convention as a meeting where

> "A parcel of delligits jest git together
> An' chat for a spell o' the crops an' the weather,"

was correct, for the rural and semi-rural towns contained two-thirds of the population of the State. At the outbreak of the Civil War the places with a population of 8,000 and upwards contained less than half the residents of the State. Now more than two-thirds of all the people of Massachusetts live in cities or towns with over 8,000 inhabitants.

MR. GOSCHEN'S SPEECH.

THE English newspapers, both daily and weekly, have been much taken up lately with Mr. Goschen's speech at Leeds on the 28th ult. The speech is very interesting, as Mr. Goschen's speeches generally are. It relates chiefly to the ultimate banking reserve of the United Kingdom, *i. e.*, to the amount of gold available to meet a crisis. He gives a rapid sketch of the principal features of the Barings crisis, and of the extraordinary measures taken by the Bank of England and its allies to meet it. Liabilities to the amount of 21 millions sterling had to be guaranteed in a hurry—so the Governor of the Bank of England stated to a deputation from Lombard Street that came to thank him for his prompt and intelligent action. If this crisis had not been averted, Mr. Goschen thinks that the consequences would have been appalling, and would have so shaken British credit that it would have transferred the banking centre of the world from London to some other place.

British credit, Mr. Goschen shows, consists of the assurance that prevails throughout the world that every bill drawn on London will be paid in *gold* of a known standard, without higgling, shaving, or postponing. It is this universal belief that gives London a preference over Paris and Berlin as a place of settlement for international exchanges. It is this which enables British merchants to command, in every market of the world, at the lowest rates, the things they want to buy, by means of letters of credit, dispensing with the use of the gold itself except to a very small amount for the settlement of international balances. If this fabric of credit were overthrown, so that it became necessary to send actual gold to pay for the goods wanted, British commerce and industry must come to a stop until credit could be reëstablished, since there is not gold enough to be had for more than the merest fraction of the trade carried on.

Credit consists of two parts, a belief in the invariableness of the standard and a belief in the ability of the debtor to pay exactly as he has agreed to. As there is no doubt about the gold standard in Great Britain, Mr. Goschen addresses himself to the other part of the question: Is it quite certain that London will always, under all circumstances, be able to meet the drafts drawn under her letters of credit at the day and hour prescribed therein? To answer this question in the affirmative we must assume that she keeps a reserve of cash, *i. e.*, gold coin and bullion, adequate to meet not merely the daily and usual requirements of trade, but the extraordinary emergencies which now and then arise. Is the customary reserve of London so adequate?

Mr. Goschen answers this question in the negative. The Bank of England holds habitually 24 million pounds sterling of gold, the Bank of France holds 95 millions of gold and silver, the Bank of Germany 40 millions sterling of gold and silver, and the United States Treasury and national banks together 142 millions sterling of gold and silver. Mr. Goschen does not here make a distinction between gold and silver as reserves. This seems to us to be misleading, since silver is no longer international money, and it is in the international aspect that he is examining the subject. The gold of the Bank of France at the last accounts, including the 3 millions sterling that it had lent to the Bank of England, amounted to 48 millions sterling. The amount held by the United States Treasury and by the banks (national and State) is probably not far from 75 millions sterling. As compared with these huge stores, the stock held by the Bank of England does look small, and it becomes still smaller when measured by the liabilities. The bank deposits of the United Kingdom, not including those of the Bank of England, are upwards of 600 millions sterling. The joint-stock banks keep cash only to the extent of 10 to 12 per cent. of their liabilities, and it is not always easy to tell what this "cash" consists of. The portion kept by them in the Bank of England can be identified easily enough, but the portion kept in their own vaults may be almost anything that they choose to describe by that name—as, for example, call loans on first-class collaterals, good enough for ordinary times, but not cash when a large number of banks and individuals want to realize at the same moment. Practically the cash in the Bank of England is the sole metallic banking reserve of the United Kingdom. The bank has liabilities of its own, including those to the other banks, against all of which it keeps 40 to 50 per cent. of reserve. The long and short is, that the ultimate banking reserve of the United Kingdom is not more than 10.2 per cent. of the liabilities. And this Mr. Goschen considers inadequate, decidedly so.

But there is a quantity of gold coin in circulation, in the pockets of the people, estimated at 65 to 70 millions sterling. This is necessary for daily transactions, since there are no circulating notes in England of less denomination than £5. It would be possible, however, to make an issue of £1 notes, and to capture a gold sovereign for each note thus put into circulation. Mr. Goschen says that he would rather have 20 millions of gold in a reserve than 30 millions in the pockets of the people: it would be so much more available in case of a crisis. Therefore he proposes to make an issue of £1 notes, and with the gold thus taken up from the circulation to create what he calls a "second banking reserve," the first one being what is now kept by the bank.

It is easy enough to steer 20 millions of this circulating gold into the bank vaults. Practically, it would only be necessary for the bank to post a notice that it would give one-pound notes in exchange for gold to the extent of 20 millions. The gold would come in with a rush, because the notes are so much more convenient to carry and to transfer from place to place. But when the gold is "corralled" and dubbed second banking-reserve, what next? What is to be done with it? What are the conditions upon which it can be made to answer the purposes of a reserve? A reserve is made to be used, not to be looked at. What is the difference between a first reserve and a second reserve? Are they to be kept in different boxes? Suppose that the joint-stock banks, which now keep a 10 per cent. reserve in cash at the Bank of England, should lower it to 8 per cent.—Mr. Goschen says that they have lowered it from 12 per cent. to 10 per cent. within ten years. Would not the condition then be about what it is now?

These questions are still unsettled in Mr. Goschen's mind. He says that he has had consultations with the Bank authorities on the subject of the second banking reserve, but has not come to any conclusion as to the details. The fact that he cannot control the joint-stock and private banks, who are able to draw down their deposits at the Bank of England at their own free will and pleasure, is the sticking point. He holds up for admiration the law of the United States which requires of national banks a 25 per cent. reserve as against deposits, but does not say that he shall propose a similar law for Great Britain. He probably feels very much as the New York Legislature would feel if it were asked to pass a law to prevent Drexel, Morgan & Co. from drawing their money out of any Clearing-house bank where they habitually keep it. The utmost that Mr. Goschen promises to do is to bring in a bill to provide for more frequent publication of bank statements.

"Banking," says a writer in the *Economist*, "is the art of handling other people's money. It is an art much in demand and extremely useful, and all who have money are concerned in its improvement, but no such art has ever gained much by Government interference." This thought, sound to the core, is evidently dominant in the public opinion of England. It is this which restrains Mr. Goschen from creating his second banking reserve in a hurry, or from indicating, as yet, what method he will adopt to impound the twenty millions of gold when he gets it. The world of finance will watch the process with the keenest interest.

Another measure considered by Mr. Goschen is the issuing of ten-shilling notes against silver. This plan, if it can be called such, is also in an inchoate state in his mind. He does not tell us whether the silver

against which the ten-shilling notes should be issued would be subsidiary silver or not. Probably it would be, since England has no legal ratio between silver and gold. If it is subsidiary silver, the question will arise why any should be kept, since nobody would "run" the bank for subsidiary coins, which could not be exported except at a heavy loss. The whole speech of the Chancellor of the Exchequer is suggestive rather than conclusive, and, if not followed by definite action, will scarcely add to his reputation as a financier.

THOMAS PAINE'S FIRST ESSAY.

NEW YORK, January 29, 1891.

IN his second *Crisis*, Thomas Paine, addressing Lord Howe, writes: "I have likewise an aversion to monarchy, as being too debasing to the dignity of man; but I never troubled others with my notions till very lately, nor ever published a syllable in England in my life." It has been alleged that this is inconsistent with his having written in 1772 'The Case of the Officers of Excise.' This, however, though printed, was not published until 1793. It was an official document which Paine had been appointed by his fellow-excisemen to draw up for submission to Parliament. One writer says his "Song on the Death of Gen. Wolfe" was published in the *Gentleman's Magazine;* but though written at Lewes, England, it was first published in the *Pennsylvania Magazine*. Mr. W. H. Burr maintains that Paine, under the name "Casca," wrote numbers of the English *Crisis* during the year 1775, beginning in April. This is disproved by the intrinsic evidences in Casca's essays that he was then in London, whereas Paine was certainly in America throughout 1775, editing the *Pennsylvania Magazine*. An interview with Rush, in the latter part of March, and another with Franklin in October, are also on record. There is no reason whatever to doubt Paine's statement that he had published nothing in England. The cause of America, he says, made him an author. It is nevertheless true that his earliest essay, which I have just found, was a plea for the American slave.

The only mention I have seen of this essay is in the letter written by Dr. Rush, July 17, 1809, to James Cheetham, for his hostile biography of Paine:

"About the year 1773 I met him accidentally in Mr. Aitkin's bookstore, . . . Soon afterwards I read a short essay with which I was much pleased, in one of Bradford's papers, against the slavery of the Africans in our country, and which I was informed was written by Mr. Paine. We met soon afterwards, in Mr. Aitkin's bookstore, where I did homage to his principles and pen upon the subject of the enslaved Africans. He told me the essay to which I alluded was the first thing he had ever published in his life."

The date "1773" is erroneous, Paine having arrived in America November 30, 1774. There are other mistakes in Dr. Rush's letter—among them, pretty certainly, his report of Paine's words, for the anti-slavery essay did not appear until March 8, 1775, and before that Paine had entered on his work of editing Mr. Aitkin's *Pennsylvania Magazine*, and had published several articles therein. What Paine told Dr. Rush was, no doubt, that the anti-slavery essay was the first he had ever written or offered for publication. The essay was published in the *Postscript to the Pennsylvania Journal*, and contains several points that would hardly have been addressed to a public made frantic by the tea-riots in the latter part of 1774. It was no doubt written about the middle of that December, or before, and prudently delayed by Bradford. Whether it be that Paine's biographers and editors were misled by Dr. Rush's report of the author's words, or that the essay seemed to them too orthodox to be genuine, they have left it buried in the old journal, and our histories of the anti-slavery movement have neglected this early and remarkable manifesto of Abolitionism.

From the first part, a burning denunciation of the slave trade, I will quote two passages bearing striking resemblance to parts of the original Declaration of Independence:

"The Managers of that Trade themselves, and others, testify that many of these African nations inherit fertile countries, are industrious farmers, enjoy plenty, and lived quietly, averse to war, before the Europeans debauched them with liquors, and bribing them against one another, and that these inoffensive people are brought into slavery by stealing them, tempting kings to sell subjects, which they can have no right to do, and hiring one tribe to war against another, in order to catch prisoners. By such wicked and inhuman ways the English are said to enslave towards one hundred thousand yearly, of which thirty thousands are supposed to die by barbarous treatment in the first year; besides all that are slain in the unnatural wars excited to take them. So much innocent blood have the Managers and Supporters of this inhuman trade to answer for to the common Lord of all!" "Too many nations enslaved the prisoners they took in war. But to go to nations with whom there is no war, who have no way provoked, without farther design of conquest, purely to catch inoffensive people like wild beasts for slaves, is an hight of outrage against Humanity and Justice that seems left by *Heathen* nations to be practised by pretended *Christians*."

In the paragraph that was struck out of the original draft of the Declaration of Independence it is said:

"He has waged cruel war against human nature itself, violating its most sacred rights of life and liberty in the persons of a distant people who never offended him, captivating and carrying them into slavery on another hemisphere, or to incur miserable death in their transportation thither. This piratical warfare, the opprobrium of *infidel* powers, is the warfare of the *Christian* king of Great Britain."

Paine presently warns the country that the slaves may become a danger, "should any enemy promise them a better condition." An eliminated sentence of the Declaration charges the King with inciting the negroes against us, "thus paying off former crimes committed against the LIBERTIES of one people with crimes which he urges them to commit against the LIVES of another." In his 'Common Sense' Paine speaks of the "barbarous and hellish power which hath stirred up the Indians and Negroes to destroy us; the cruelty hath a double guilt, it is dealing brutally by us, and treacherously by them."

A few weeks after the publication of Paine's appeal for the Africans occurred the affair at Lexington. His plea for independence (January 10, 1776) was followed by his controversy with "Cato," in the *Pennsylvania Journal*, in the course of which Paine says (April 24) that America, under self-government, may be "as happy as she pleases: she hath a blank sheet to write upon. Put it not off too long." At this point he adds the italicised footnote: "*Forget not the hapless African.*" The year's tempests had not driven the slave's cause from his mind, though no one else appears to have spent a thought on the Africans, in that juncture. On June 11 the Committee was appointed to draft the Declaration, and it was no doubt Paine who endeavored to set in that foundation of liberty the stone which the builders rejected, and which afterwards ground us to powder.

Those who excluded the negro from the charter of equality had already reason to remember the warning in Paine's anti-slavery essay, that the slaves would prove a danger "should any enemy promise them a better condition." In Virginia, Lord Dunmore fulfilled that prophecy soon after it was written, but it took one hundred and eleven years to bring its full import home to those who ignored Paine's later appeal, *Forget not the hapless African!*

Paine answers the various defences of those who enslave human beings, and finds "most shocking of all" the Scriptural defence. "One would have thought none but infidel cavillers would endeavour to make them [the Scriptures] appear contrary to the plain dictates of natural light and conscience, in a matter of common Justice and Humanity; which they cannot be." The example of the Jews may not be imitated by us in slavery any more than polygamy. But "they had no permission to catch and enslave people who never injured them." "Such arguments ill become us since the time of reformation came, under Gospel light. All distinctions of nations, and privileges of one above others, are ceased. Christians are taught to account all men their neighbours, and love their neighbours as themselves." One would, he adds, almost wish some distant neighbors could carry off and enslave some thousands of us for once; "it might convince more than Reason or the Bible." But the chief design of his paper, Paine says, is not to disprove these arguments, which many have done—

"but to intreat Americans to consider:

"(1.) With what consistency or decency they complain so loudly of attempts to enslave them, while they hold many hundred thousands in slavery; and annually enslave many thousands more, without any pretence of authority or claim upon them?

"(2.) How just, how suitable to our crime is the punishment with which Providence threatens us! We have enslaved multitudes, and shed much innocent blood in doing it, and now are threatened with the same. And while other evils are confessed, and bewailed, why not this especially, and publicly, than which no other vice, if all others, has brought so much guilt on the land.

"(3.) Whether, then, all ought not immediately to discontinue and renounce it, with grief and abhorrence? Should not every society bear testimony against it, and account obstinate persisters in it bad men, enemies of their country, and exclude them from fellowship, as they often do for much lesser faults.

"(4.) The great Question may be—What should be done with those who are enslaved already? To turn the old and infirm free would be injustice and cruelty; they who enjoyed the labours of their better days should keep and treat them humanely. As to the rest, let prudent men, with the assistance of legislatures, determine what is practicable for masters, and best for them. Perhaps some would give them lands upon reasonable rent; some, employing them in their labor still, might give them some reasonable allowances for it; so as all may have some property, and fruits of their labours at their own disposal, and be encouraged to industry; the family may live together, and enjoy the natural satisfaction of exercising relative affections and duties, with civil protection, and other advantages, like fellow-men. Perhaps they might sometimes form useful barrier settlements on the frontiers. Thus they may become interested in the public welfare, and assist in promoting it, instead of being dangerous, as now they are, should any enemy promise them a better condition.

"(5.) The past treatment of Africans must naturally fill them with abhorrence of Christians; lead them to think our religion would make them more inhuman savages if they embraced it; thus the gain of that trade has been pursued in opposition to the Redeemer's cause, and the happiness of men: Are we not, therefore, bound in duty to him and to them, to repair these injuries, as far as possible, by taking some proper measures to instruct not only the slaves here, but the Africans in their own

countries? Primitive Christians labored always to spread their *Divine Religion;* and this is equally our duty while there is an Heathen nation. But what singular obligations are we under to these injured people?

"These are the sentiments of

"JUSTICE AND HUMANITY."

It will be observed that Paine was at this time a devout Christian; but his heresies, written twenty years later, are potential, so to say, in his apology for some of the Jewish records, and what he says of "natural light." Dr. Rush says that after Paine's return from France to America he did not meet him. "His principles, avowed in his 'Age of Reason,' were so offensive to me that I did not wish to renew my intercourse with him." The negations of that work are, however, moderate compared with those of many authors in our time whose writings are treated with respect by all; and it is but fair that an Age of Toleration should renew our acquaintance with this early advocate of American independence and negro emancipation.

I may add that Paine's *Pennsylvania Magazine* (1775) exposed the absurdity and criminality of duelling, denounced cruelty to animals (then unprotected by any statute), and pointed out the wrongs of woman. I believe the articles alluded to to be from his pen; but at any rate these seeds of large movements were sown by his magazine, within the first year after his arrival in this country.

MONCURE D. CONWAY.

THE PUBLIC RECORDS IN ENGLAND.

LONDON, December, 1890.

To one conscious of our own national system for the preservation of records, there is much to learn in the methods of this country, which are centralized in the Public Record Office in Chancery Lane. The progress of the movements which have resulted in the present conditions here can be readily matched with ourselves, if we are wise enough to move forward in much the same way, for the circumstances in England fifty years ago were not far from the same which prevail with our Government to-day. No one is more conversant with the shortcomings of our present system, or lack of system, than the historical student; and these defects come from the want of continuity and long-developed skill in office, and the subjection of the highest interests of historical research to the caprices of political appointments to the office of archivist. I have applied to two of the principal Cabinet departments in Washington within five years for sight of documents which I knew they possessed, and have been told that such documents were not in the departments; but subsequent appeals to the heads of those departments led to special search, and the documents were found stowed away perhaps in some uninspected cupboard.

Nor is this all. The growth of a proper archivistic sentiment has been a slow one, and it has by no means yet attained a satisfactory development everywhere. It is only of late years, comparatively, that a public officer did not feel at liberty to appropriate to himself the official documents which have accrued on his hands. There have been crude notions that such papers were so far personal that in case the officer's administration should be attacked at a later day, he had a right to the possession of the papers which would serve for his defence. I have had in my hands, within two years, the papers of a Secretary of the Navy of the United States seventy-five years ago, which are in the possession of a descendant of that Cabinet officer; and nearly every paper ought to be in the files of the Department at Washington, for they embraced the official reports of naval commanders from different parts of the globe. There was, however, in those days no clear conception of the Government's rights to the possession of such papers, and it was no discredit to the incumbent of such a high office that he claimed these papers as his personal property, if he thought anything of the matter at all. Even so late as our Civil War only, the papers of commanders of fleets went into the public archives; and no one knows so well as Prof. Soley, who is now arranging for the Navy Department its records to illustrate the service of the navy during that war, how deficiently represented some events are, because the papers of the commanders of ships in such fleets were kept—lawfully enough—by such officers, and can only now be found by searching them out through the breadth of the country.

I am also afraid it is not yet regulated as it should be, that the papers of our American consuls in foreign lands are transmitted by each to their successors or to the State Department in turn; but much has been done to improve this branch of the service. I should not feel at all certain that something might not at any time happen, particularly if some years had elapsed, equivalent to what was experienced by an historical investigator within a few years. In the study of certain delicate relations of the Government, incident to the outbreak of a war, a consul of the United States was instructed as to the course he should pursue. Application was made forty years afterwards at the Department in Washington to see those instructions, and permission was refused as involving acts which the time had not come to disclose. The same investigator afterwards traced from the family of the Consul the papers of that official, and recovered the original despatch in question, of which the Department preserved the copy. Applying later at the same office for permission to see such portions as would not jeopardize the public interests, the paper was laid before him with some portions hidden from view, and the man, who had the original or another copy of it in his pocket, found out just precisely what the Department felt, if published, would be detrimental to the public interests. There is something farcical in all this, and it places the haphazard management of our public papers in the most unsatisfactory light. There is no doubt much is doing to regulate things better, but progress is not as rapid as one would wish, and it can never be brought towards a reasonable degree of perfection until something like a regulated tradition and practised scrutiny is established, as the result of a service independent of political interference.

Before the institution of the Public Record Office here in London, under the control of the Master of the Rolls, the records of the Government were scattered in perhaps sixty different depositories in this great metropolis; and although they were cared for with more intelligence, I fear, than has been the case with us, or could be the case without a reformed civil service, there was a sensible lack of permanence in that they were not massed and subjected to constant control, animated by a single purpose. This was effected by the institution of this Public Record Office. I went all over it the other day under the guidance of its chief executive, the Deputy Keeper of the Records. It is a stone structure with iron stacks and slate shelving. I could not but remark, however, that with all these precautions against conflagrations, there were still open soft-coal fires for heating the offices and the various rooms where investigators work; lanterns used to thrid the dark passages to search for the papers wanted; and even an open grate in full blast, with paper shavings littering the floor, in the apartment where paste was boiled and repairs made upon old parchments and manuscripts. Much can be pardoned in efforts to make foggy, smoky, dismal London habitable; but there seems something yet for them to learn in these matters. They had, indeed, in a part of the building just introduced the incandescent electric light; but when one hears a description of the time wasted and temper spoiled in any of these departments in order to get the attention and help of such other departments as those of Public Works and of the Stationery Office, if even a trifling expense is necessary to introduce some improvement, one is inclined to think that the English monarchy, with all its administrative checks and democratic supervision, shows a graft of obstacles to promptness and efficiency to which American republicanism, with its autocratic tendency, presents a strange contrast.

I saw the other day an important officer of a great Government institution trying to do his work at midday by the light of an ill placed electric light, because the Department of Works had persistently disregarded his requests for a more convenient light. He longed for something of that spirit of autocracy which overleaps the obstacles of the martinet and dares to take responsibility. Such a bill as that which is now protecting Gen. Casey from official impertinences at Washington, and enables a tried officer to make commendable progress in constructing a new building for the Library of Congress, and to have the single-minded spending of seven millions of dollars, is unheard of in British legislation. It has its dangers, but unimpeded authority in some things is worth the risk. Nations have their compensations. We throw obstacles in the way of proficient service in some things; they throw it in others. We have both to learn of each other.

The Public Record Office is a good school of instruction in its peculiar province. Take its relations with any one of the departments of Government—say the Home Office, where I spent an hour or two yesterday in studying the methods of preserving its papers. I have before me two documents which indicate some of the care and discrimination called for. One is "A list and particulars of classes of documents existing or accruing in the Home Department which are not considered of sufficient public value to justify their preservation in the Public Record Office." Then follow perhaps seventy classes of documents, each often subdivided into from two to ten more confined classes. Each of these divisions has set against it the figures 5, 10, 20, or 30, which means that those number of years must elapse before any supposed valueless papers can be taken out for conversion into pulp—this being the mode of destruction. Then another printed list is entitled "Rules for the preservation of valuable and the destruction of valueless documents in the Home Office." Any rules like these necessarily leave much to the discretion of trained officers; and so it is brought about that this sifting of papers for destruction is subjected to reduplicated scrutiny before the choice is finally confirmed. What is left is sent to the Public Record Office, with stated instructions as to the use which the public can be allowed to make of them. It must be a very exceptional case that anybody can inspect the papers kept back from the Record Office for administrative purposes;

and as a rule no one can inspect those sent to the Record Office, if of date later than 1760, unless by permission of the Home Secretary. An historical writer like Lecky may get such permission; but the Office reserves the right to inspect his note-books before he can take them away, so as to prevent premature or unadvisable publicity. Though the judges have the authority to summon any such restricted paper into court, if the Office intimates the imprudence of publication, the point is rarely pressed by the court.

Then the Rolls House, in connection with the Record Office, is constantly printing for public distribution those large volumes which give abstracts or calendars of the documents which are back of 1760, and brought from the departmental offices; but, after the printing and before the publication, the volume must be submitted to the head of the particular department concerned, and he may or may not order its publication; and instances of restraining the publication for longer or shorter periods do occur. It may also happen that successive heads of departments, with the change of governments, may not agree on the question of publication, so that one government may direct publications which a succeeding government judges to be embarrassing. But these things are necessarily classed among the defects of human judgment, not to be prevented and not easy to regulate.

The offices of Government keep three sizes of official paper, and the size is indicative of the character of the document, and is a guide in classification. The ordinary foolscap is the regular official communication. The quarto sheet is the semi-official letter. The note size is the confidential and personal correspondence. A large part of this latter kind of communication never gets into the archives of the Office or of the Public Record Office, and they are the proof of the necessity that an historian should in due time find access to the private papers of a statesman and politician, if he would understand the secret purposes of leaders of Government and parties. It is this that has made of so much importance the memoirs and correspondence of political characters of the past in English history, as in that of other lands. So it appears that ministers to-day carry from office not the least considerable part of the historical material which must be a necessity to coming writers, and there is much the same necessity of guarding these private repositories against inquisitors as there is in the public archives. The awkwardness of the matter is that they are beyond official control, and statesmen in power have little to depend on to avoid such embarrassments but the general conservatism of the English character. Mishaps from such leakings do happen, and one is now under consideration—or at least a paper kept secluded in the Record Office has been made public which might well have come from a private repository where it was preserved in another copy. Perfection in the guarding of documents is probably not possible.

The Record Office is not ample enough for its purpose, and no great number of years has elapsed since its erection. There are certain old buildings surrounding it which are far from fireproof, and which it is intended to destroy so as to make room for additional buildings. One of the causes of the rapid growth of the collection is the accumulation of duplicates of papers and the amassing of papers of little or no value among the quantities turned in from all these sixty independent repositories when the office was established. Therefore a few years ago her Majesty gave her approval to an act which enables the custodians of the Record Office to convert, as they have done within a few years, a good many tons of paper into pulp, they being sent to the Stationery Office for the purpose. The rules under which the committee of three who ultimately decide the fate of a document act are very stringent, and they involve ceaseless scrutiny of even minor attachments or endorsements, printed lists of proposed sacrifices of papers, and the needful examination of such lists by those classes of officials who have particular concern with papers of the sort.

JUSTIN WINSOR.

FATEHPUR.

INDIA, December, 1890.

AGRA is the show city of India. It has, indeed, nothing of the same type with the wonders of Madura and Benares. In Madura the pagodas, or pavilions, are more towering than anything else in the heathen world. In Benares the line of palatial temples, unbroken for a mile along the river-front, has no rival anywhere. But in Agra forts, palaces, mosques, and especially tombs, are architecturally of a higher type, and waken a more diversified interest. The fame of these marvels, especially that of the Taj, has echoed through the world. Hence a stranger approaches them with extravagances of expectation which nothing can satisfy.

Fatehpur, two and twenty miles from Agra, in a dry and thirsty land scarcely habitable but for governmental irrigating canals, and distant from railroads, is little known and less visited. Accordingly the traveller who turns aside from the beaten path, discovers it with the zest of surprise. His wonder grows as he finds the ruins as solitary and tenantless as Pompeii, and in such perfect preservation that he refuses to call them ruins at all. Fatehpur was founded by Akbar, the greatest of the Great Moguls, about 1570, and, in the judgment of the highest Indian authorities, is the most express and lively image of his genius so far as bodied forth architecturally; for Agra was the creation of many emperors, while Fatehpur began and ended with Akbar. He made it all.

His works there stand on a steep hill or acropolis rising sharply from the dead level of a wide prairie. His choice may have been determined by a site so defensible and commanding. Lack of water forced him to make Agra as a twin capital, but he kept on building in Fatehpur, where his grandest edifice was not finished till the forty-sixth year of his reign. Akbar's choice of a site may also have been fixed on Fatehpur by a quarry, close at hand and inexhaustible, of the richest red sandstone. This quarry still sends building material to Agra.

The walls of Fatehpur, on low land circling the hill, were seven miles in circuit, and are still standing. The handiwork of Akbar on the height includes a triumphal arch, castle gateways, mosques, halls of audience and judgment, tombs, stables, hospices or rest-houses for pilgrims, and a vast number of apartments, which move the more of wonder because their purpose is not known, and is often beyond probable conjecture. All seem built to last for ever. Red sandstone is throughout the chief material for pavements, walls, pillars, and even roofs. It was quarried in masses so large, and those combined so artistically, that not only broad corridors, but broader rooms are thus covered. But the widest spaces are overarched by sandstone domes. Some of these are *sui generis*, in a style suggested by the long slabs of sandstone. The greatest astonishment of visitors is, however, excited by the air of freshness and newness in every hall and room, as if the masons had just made all ready for furnishing. No stucco, plaster, or paint has ever marred the smooth-hewn surfaces. In places it is inlaid with many-colored stones; sometimes it is carved in low relief, sometimes marble veneers are pieced so delicately as to be mistaken for lace curtains, or are floreated in more exquisite patterns than the grain of sandstone allows.

The approach to Akbar's edifices is by ascending a staircase thirty feet high. This construction is similar to the ascent to the Propylæa before the Athenian Acropolis. But the portal above—which serves alike for the gateway of the wall and for an arch of triumph—belittles everything in Athens. It is twice as high as the Parthenon itself ever was, and, indeed, is perhaps the highest ever reared. The height above the threshold is 130 feet. Was there ever any other city gate so high? If the staircase which forms its pedestal be added, the altitude—160 feet—will equal that of Napoleon's grand arch in Paris, which is far the highest ever built. Akbar's arch is adorned with polychrome floreated inlays, and on a band of cream-colored sandstone, enclosing its entrance on each side, we read, if we know Arabic, its date, A. D. 1601, and the words: "Jesus, on whom be peace, said, 'The world is a bridge; pass over it, but build no house on it. The world endures but an hour; spend it in devotion.'"

The wooden gate, beneath a demi-dome, is thrown back far in the gateway. It is a foot thick, has a wicket, and has many a horse-shoe ornament nailed upon it. Passing within we are in a court 444 feet by 372. A broad corridor runs round it, behind which on two sides are many scores of rooms of rest for wayfarers, ever hospitable to all comers. On our left is a mosque said to be a copy of that in Mecca. Its floor and walls are polished marble, and its vast domes rich in ornament. In this court is the tomb, in the highest Moslem style, of Selim, a fakir or hermit held in highest honor by Akbar, and who died in 1571. The story is that Akbar was overwhelmed in sadness when, visiting Selim here, he was told by him that he could never have a son living to succeed him unless some one would die to secure him that boon. The son of Selim, however, a precocious little child, seeing Akbar's gloom, cried out, "I will die for you!" and did die at once. This child's tomb is on the left, just outside the court. Another gate of this court is a worthy pendant to the grand portal. Passing in, we come to Akbar's seat of judgment between the lower and higher courts of justice. Round the former are rooms of rest for suitors waiting for the imperial decisions.

Beyond these courts are many smaller buildings well suited to human uses. There is a little mosque for women—three dainty dwelling-houses, with walls abounding in reliefs and inlays both on sides and ceilings, as well as light marble trellises. These were abodes of three of Akbar's wives, one Hindu, one Moslem, one Christian. The last is identified by certain Greek crosses and the wings of the Angel of Annunciation. The abode of another of the imperial favorites is now used as a school-house where a hundred children of neighboring peasants are instructed. Another structure with more than a hundred pillars rises to the height of five stories. Others, fantastic and freakish, are nondescripts, yet all of choice stones and goodly, with not an inlay effaced and not a flower obscured. Others are said by antiquaries to be intended for games like

blindman's buff, or chess-boards, where each check is a foot square.

Further within is the stable. Stalls for 106 horses are still perfect even to rings in the rock for halters. Others are ready for camels and elephants. The gate in the rear of the palace is twofold, inner and outer, in order to be more defensible. On each side of the outer entrance stand two elephants of more than life size, and placed so high that their trunks could interlock over the keystone of the gate. In truth they did till broken off by Aurung-Zeb in an iconoclastic fit, in which he also broke off the heads of many elaborate carvings in the queenly apartments. Below the elephant gate a monument seventy feet high marks the grave of Akbar's favorite elephant. It is stuck full of elephants' tusks cut in stone. On the high platform around it Akbar is said to have stood for shooting the wild beasts which were driven near it.

The Great Mogul's Fatehpur is a greater solitude than any desert without buildings. Loneliness is wonderfully intensified as we behold what was meant for many all alone. The feeling is cumulative as one wanders all day about the majestic pile — many houses, great and fair, without inhabitant save the school-children in a corner where they might well be passed unseen. Prescott says that no man ever spent so much on a building as the outlay of Philip II. on the Escorial. After a survey of that gloomy gridiron as well as of Fatehpur, the writer is inclined to think that the latter cost more labor. At all events, Fatehpur, which was in building during the self-same years with the Escorial, is a far pleasanter curiosity to behold and to remember. But neither of these monstrosities could have been reared by the hands of freemen, and each of them affords one of the saddest as well as most gigantic illustrations of

"The enormous faith of many made for one."

Correspondence.

TEACHERS IN COLLEGES FOR WOMEN.

To the Editor of The Nation:

Sir: My attention has been called to the following words in an editorial article in the *Nation* of February 19, in regard to the teachers in colleges for women:

"The woman's college necessarily practises, more or less strictly, a system of seclusion for its students. It has a staff of celibate [women] instructors living within its own boundaries. It follows, from the nature of the case, that students are largely restricted to the influence of the feminine intellect, both within and without the lecture-room. It is not assuming too much to say that such men as find their way as professors to the women's colleges are, with a few notable exceptions, the most inexperienced of their profession, who are using the post in hand as a stepping-stone towards the first vacancy they can fill in a non-feminine institution."

I quote these lines merely to draw attention to the fact that they do not at all apply to the teachers in the Harvard Annex, nor to the life of the students there. There is no "system of seclusion" there; there is no "staff of celibate [women] instructors living within its own boundaries"; and certainly "such men as find their way as professors" to that institution are not "among the most inexperienced of their profession."

The students at the Harvard Annex are treated as if they were women with a purpose, who had advanced beyond the period of leading-strings; there are no women among the instructors; and the "men who find their way as professors" to its class-rooms are men who have previously been appointed to corresponding positions in Harvard College.

Doubtless there are other colleges to which your remarks in these respects do not apply, though the exceptions will not at all lessen the value of your statement that "the influence of the masculine upon the feminine mind, or the reverse," is good for both.

Arthur Gilman.

The Harvard Annex, Feb. 20, 1891.

A CARICATURE.

To the Editor of The Nation:

Sir: As one of Sylvester's pupils, I wish to express my regret that the *Nation* should have reproduced a passage so ill-calculated to give a correct impression either of his personality or of his influence, as that which was quoted in a note in your current issue. The intention of the writer may have been good enough, but no reader would gather, from what he says, that Sylvester's bursts of "rhetoric" were merely the overflow of that burning enthusiasm for his science which animated him constantly, which inspired his pupils (at least for the time) with something of the same ardor, and which enabled him, when past the age of seventy, to kindle a remarkable mathematical revival at Oxford upon his return to England. It is to be regretted that if any personal sketch was to be presented to readers who have not known Sylvester, it should have been one showing such bad taste, and preceded by the use of a silly nickname which, I believe—and for the credit of Johns Hopkins students' sense and breeding I trust that I am right—was never in use among the students at Baltimore. X.

February 22, 1891.

THE NEW WORKINGMEN'S INSURANCE LAW IN GERMANY.

To the Editor of The Nation:

Sir: This law went into effect on the 1st of January, 1891, and to-day, in the *Tägliche Rundschau* of Berlin, occurs the following item, which shows the interest already taken by the people: "Up to date [January 29], in this city, 100 persons have received aid by means of the new Insurance Law, and in a few weeks the number will have reached 300. The workmen of Berlin who have already received their insurance cards number 650,000."

It may not be without interest to your readers to learn some of the practical workings of this law. All persons who have passed their sixteenth year and who earn their living by daily labor *must* insure themselves. This class includes all dependent workmen, clerks, apprentices, naval laborers, and all who have a business of their own the income of which does not exceed 2,000 marks. With those persons who have not yet passed their fortieth year, and who have worked themselves out of the above-mentioned classes, the insurance obligation is optional.

The applicant for insurance receives free an authorized insurance card from the appointed official in the district where he lives. This card is ruled off with fifty-two different spaces to be filled by insurance stamps differing according to the class in which he belongs. Class i. includes those whose yearly income does not exceed 350 marks; class ii., those whose income is 350 to 550 marks; class iii., 550 to 850 marks; class iv., over 850 marks. In class i. the stamp costs 14 pfennigs; in class ii., 20 pfennigs; in class iii., 24 pfennigs; in class iv., 30 pfennigs.

Although this card is intended to be filled with fifty-two stamps, the law allows forty-seven as a yearly minimum guarantee of insurance. When the card is full, it must be exchanged at the district office for a new one, and the owner is credited with the amount of his old card. If one of these cards should accidentally be lost, the laborer must immediately announce the fact to the authorities of his district, and furnish proof as to the amount it represented, upon which a new one will be issued covering the loss. Those who are drawn for military service are exempted from paying their insurance charges as long as their work is in that department, and their insurance account passes on into class ii. for that length of time.

Insurance stamps are sold at all post-offices, and are bought by the employer. It is his business to have them placed weekly on his workman's card. On payment of wages he has the right to deduct half of the cost of the stamps, bearing himself also half of the burden. In case the laborer is an odd-jobber rather than a steady employee, the person who first hires him in the week must pay the employer's share of the stamp. In this class are commissioners, messengers, and persons working by the hour or day. Should a man be compelled to stop work on account of illness, his insurance continues without payment of stamps, on the evidence of a physician's certificate as to the nature and duration of his illness.

A workingman desiring to increase his insurance may be reckoned in a higher class than his income naturally places him, by paying the premium of that class. The class of persons with whom the insurance obligation is optional *must insure at their own cost entirely.*

Now as to the benefits of the insurance. Every insured person receives fifty marks yearly from the Government at the expiration of his term. One who has a claim on the invalid's annuity receives, in addition to the Government allowance, sixty marks yearly from the Association. Any person has a right to such an annuity who is unable to work, *i. e.*, is in such health that he is not able to earn the minimum yearly wage. Exceptions to this are such as have made themselves unfit for work by attempting suicide or by committing crimes which bring them into prison. And if a workman is unfitted for labor on account of accident, then he receives help on condition that he is not a beneficiary of an Accident Insurance Association. Before he can claim an invalid's annuity he must have paid into the treasury the value of two hundred and thirty-five weekly stamps; but in this number are included also those which were not paid during temporary illness or military service. The invalid's claim being granted by the Association, his account with the treasury stands thus: He receives first his grant of fifty marks yearly from the Government and the sixty marks annuity of the Insurance Corporation; second, for every stamp which he has paid he receives back a percentage of the same in the following manner—for every fourteen-pfennig stamp, two pfennigs; for every twenty-pfennig stamp, six pfennigs; for every twenty-four pfennig stamp, nine pfennigs, and for every thirty-pfennig stamp, thirteen pfennigs. The time of his illness and that spent in military service is reckoned in class ii. at six pfennigs per week.

To explain further, let it be supposed that an invalid has laid his claim before the Association, and, at the time of his petition, has to his credit 100 stamps in class i., 150 stamps in class ii., 50 stamps in class iii., and 300 stamps in class iv. He has also been sick forty weeks,

and has spent ten weeks in military service. In such a case the man's account should be this :

Government grant	50 marks	
Annuity from the Association	60 marks	
100 stamps in class i.	2 marks	
150 stamps in class ii.	9 marks	
50 stamps in class iii.	4 marks	50 pf'gs
300 stamps in class iv.	39 marks	
40 weeks' sickness	2 marks	40 pf'gs
10 weeks in military service		60 pf'gs
	167.50	

There is a "recommendation to mercy" in the operation of the law during the next five years, which may be illustrated as follows : A man on the first of January, 1892, becomes an invalid. Up to that time he has paid for 50 stamps, but then fail 185 stamps. If this man can prove that for five years before he became an invalid he was a workman in good standing, the authorities *may* allow his claim to an invalid's annuity.

The payment of this annuity to the invalid takes place monthly at the post-office of the district in which he lives. Sometimes, when an invalid is a forest or farm laborer, he may receive two-thirds of his allowance in kind, and a man proved to be a drunkard *must* be paid in food and clothes. In making claim to an annuity, the petition is first sent to the head office of the district in which the insured resides. If the claim is granted, the man receives a notice as to where and when he will be paid. If it is not granted, the petitioner has four weeks in which to make an appeal to an arbitrating council composed of two insurance officers, an employer, and a workman, chosen from the insurance circles. If this council refuses to allow the man's claims, he has as a last resort an appeal to the Government Insurance Commission.

The workman who reaches seventy years without necessity for invalid insurance has a claim to an "old-age" annuity. If for any reason he is receiving aid from an accident-insurance association, then the old-age annuity is only allowed so far as is necessary to make with the two an allowance of 415 marks yearly. Before one can have any claim at all, however, he must have registered to his credit 1,410 stamps. The petitioner in this case, as in the other, receives first the 50 marks from the Government, and then the following percentage on the stamps paid in: For every stamp in class i. he receives 4 pfennigs; in class ii., 6 pfennigs; in class iii., 8 pfennigs; and in class iv., 10 pfennigs.

As only 1,410 weekly payments are permitted to draw any insurance, if more than that number have been paid, a certain percentage of the amount is reckoned in the higher classes. For example: A laborer has, at the end of his seventieth year, 1,800 payments credited to him, 500 of which are in class i., 400 in class iii., and 900 in class iv. Further, he was for forty weeks sick and fifty weeks in the military service, so that ninety weeks are counted in class ii. In such a case the reckoning would be—900 payments in class iv., 400 in class iii., 90 in class ii., and 20 in class i. Consequently, 480 of the class i. payments are not counted, and the man's bill against the Insurance Association would be as follows :

Government grant	50 marks	
900 stamps in class iv.	90 marks	
400 stamps in class iii.	32 marks	
90 stamps in class ii.	5 marks	40 pf'gs
20 stamps in class i.		80 pf'gs
	178.20	

As in the invalid's case, there are certain instances in which the operations of the law may be considerably shortened, so that men now in advanced life may not be entirely shorn of its advantages. For instance: The law allows the workingman who, on the 1st of January, 1891, was over forty years of age, to diminish the number of his payments by as many times 47 (minimum yearly amount of payment) as he has years in excess of forty. If he is forty-four years of age, 47 is multiplied by 4, which yields 188, and he then needs only to make 1,222 payments before he receives his age annuity. And if a workman was seventy years of age when this law came into effect, he multiplies 47 by 30, which gives 1,410, and, therefore, is not compelled to pay anything, provided he can furnish proof that he has been in a good working condition 141 weeks just previous to the time when the law went into operation.

The payment of the age annuity takes place in the same manner as in the case of the invalid, and if the workman in this instance as in the other is a forester or farmer, he is liable to receive part of his insurance in kind ; if a drunkard, the entire allowance will be paid to him in food and clothes. This old-age claim is preferred as explained above.

The officers of the Insurance Association are allowed to grant to any insured person medicinal aid if the temporary illness is likely to develop into a prolonged illness. This feature of the law becomes of great importance since Dr. Koch's discovery of a cure for tuberculosis, as this disease predominates among the working classes. The Association has the right to command a laborer who is affected with partial tuberculosis to submit himself to the Koch treatment at the Association's expense. Should the man refuse to do this, he runs the risk of eventually losing his right to claim an invalid's annuity.

Female workers and servants who have married before any claim to insurance is valid, will receive back the half of the amount which they have paid in stamps. If a man dies before he is entitled to an annuity, his widow and children under fifteen years of age may receive the half of what has been paid by him. The children of a widow who are under fifteen years of age, are entitled, on the death of their mother, to the half of what she had paid on her insurance.

This law is emphatically a poor man's law; the employer of labor, the capitalist, and the State having no advantage whatever in its provisions. It had its inception under the "Bismarck dynasty," and bids fair to be a success under William II. J. F. WILLARD.

BERLIN, GERMANY, January 29, 1891.

Notes.

THE change is announced, since June 1, 1890, of the New York agency of Macmillan & Co. into a distinct business under the same firm-name. This house will still act as agents for the London firm of Macmillan & Co., and for the publications of the Oxford and Cambridge University Presses. The head of the business direction will be Mr. George P. Brett.

Harper & Bros. announce 'Our Italy' (*alias* Southern California), by Charles Dudley Warner; 'Reminiscences of President Lincoln,' by L. E. Chittenden; 'Oberammergau, 1890,' a poem by William Allen Butler, illustrated; a Life of Sir Robert Peel, by Justin McCarthy; 'Pharaohs, Fellahs and Explorers,' by Miss Amelia B. Edwards; and 'Lamb's Tales from Shakspere's Tragedies,' edited by Dr. W. J. Rolfe.

J. B. Lippincott Co. have in press 'The Old Navy and the New,' by Rear-Admiral Daniel Ammen; 'Aids in Practical Geology,' by G. A. J. Cole; 'An Introduction to the Study of Metallurgy,' by C. Roberts Austen; and 'The Design of Structures,' by S. Anglin.

D. Appleton & Co. will shortly publish 'A Plea for Liberty,' a body of essays by different hands, including Mr. Herbert Spencer, edited by Thomas Mackay. It is of anti-Socialistic tendency.

G. P. Putnam's Sons announce 'The Life and Writings of George Mason' of Virginia, edited by his great-granddaughter, Miss Kate Mason Rowland, in two volumes; 'The Industrial and Commercial Supremacy of England,' by the late Prof. J. E. Thorold Rogers; 'Chapters on Banking,' by Prof. Charles F. Dunbar of Harvard; and a "Darro" edition of Irving's 'Alhambra,' ornamented with Moorish designs, and illustrated with special views in photogravure.

A boy's story, 'Master Rockfeller's Voyage,' by W. Clark Russell, will be brought out, by arrangement with the author, by Thomas Whittaker.

Maj. John Johnson's 'Defense of Charleston Harbor' has been received, deservedly, with so much favor that it has already passed to a second edition. The publishers are Walker, Evans & Cogswell Co., Charleston, S. C.

We can recommend every one to procure the little pamphlet called 'Social Diseases and Worse Remedies' (Macmillan), in which are bound up Prof. Huxley's ten letters to the *Times* on the subject of Gen. Booth's new scheme for Darkest England, together with a short preface, an essay on "The Struggle for Existence in Human Society," and the "articles of war" of the Salvation Army, the form of application for appointment as an officer in that army, the doctrines and the declaration. In fact, these extraordinary official documents are alone worth the price of the pamphlet to any thoughtful person.

The late Gen. Sherman, shortly before his death, arranged for the continued publication of his 'Personal Memoirs' through Chas. L. Webster & Co. of this city, who accordingly have just brought out this ever-instructive and captivating work in a style uniform with the Memoirs of Grant and Sheridan—a conjunction which must be allowed to be most fitting. The edition is numbered the third, but it has no fresh preface. The second was issued in 1885.

As we have noted before, 'Adventures on the Mosquito Shore,' by E. G. Squier (Worthington Co.), is a reprint of 'Waikna,' which dates back to 1855. Some rather curious results of the use of the old plates come to light. The pseudonym of the old title-page, "Samuel A. Bard," properly gives way to the author's real name on the new one, though the assumed name is allowed to stand in the body of the book, to the unnecessary mystification of the modern reader. The sixty illustrations of the original edition become sixty-six in the new, through the intercalation of several "process" pages and the omission of some of the old full-page wood-cuts. This accounts for the way in which p. 223 follows p. 220 in the reprint; an illustration stood there formerly. There is also a strange failure of the designer of the new illustrations to get into harmony with the editor; the frontispiece takes its text from the omitted preface of the original, and refers to page 5—a page which does not exist in the reprint. Some incidental statements of the book—as, for instance, that "paper is getting dear and scarce"—have a curious sound under date of 1891, though this particular assertion may have been made in prophetic foresight of the McKinley Bill. On the whole, the narrative retains its interest, and, with its attractive blending of fact and fancy, makes very agreeable reading.

The Scientific Publishing Co. of this city

sends us Wedding's 'Basic Bessemer Process,' translated from the German by Wm. B. Phillips and Ernst Prochaska. To those who are specially interested in iron manufacture, even if only from a purely scientific point of view, this work will be of great value. It contains a full historical account of the development of the so-called basic-lining Bessemer process as now practised in Europe, though not as yet to any great extent in this country, while a supplement by one of the translators, Mr. Prochaska, gives the details of the application of the same fundamental principle to open-hearth furnaces. The credit of the successful introduction of this first-class improvement is due to Sidney Gilchrist Thomas, whose first English patent bears date April 10, 1879. The principle involved is simple; the success of the process in removing phosphorus almost wholly from iron depending upon the fact that phosphorus, oxidized in presence of bases—lime, magnesia, etc.—yields phosphates of the bases, which may be slagged off and removed, while in the presence of silica the removal is possible only to a limited extent. The principle involved was not new, but Thomas made its application a success. The work is full of details of the application, and must take its place as a standard book of reference.

The Harvard Annex is to be credited with a piece of technical work which compares favorably with the best of that done by the young men. It is a contribution from Prof. Mark's department, the Zoölogical Laboratory, of the Museum of Comparative Zoölogy, viz., No. 7, vol. ɔx, of the Bulletin, entitled "The Origin and Development of the Central Nervous System in Limax Maximus," by Annie P. Henchman. This paper, of thirty-nine pages and ten plates, attests good powers of observation, extensive knowledge of methods in microscopy, familiarity with the literature of the subject, and ability to delineate well either in text or drawings.

Henry Drummond's latest work, 'Pax Vobiscum,' has recently been translated into Danish. The Danish translation of the same author's 'The Greatest Thing in the World' has already reached a fifth edition, and shows no signs of diminishing in popularity.

The phototype edition of the Older Edda, of which mention has already been made in these columns, will be published on or about the first of April. Subscriptions for it may still be sent, by members of the Society for the Publication of Old Norse Literature, at the reduced price of ten kroner, or by others at twenty kroner. The annual fee of the Society is five kroner, which entitles the member to the publications for the year.

According to an article in a Danish journal, the book-production of Denmark and Norway shows a decided falling off during the past two years. The number of works in the department of belles-lettres published in the two countries during 1888 amounted to 300, while in the following year it fell to 229, and in 1890 to 201, of which 79 were translations. Of the 122 original works, 100 appeared in Denmark. It must not be concluded from this, however, that Norway's literary activity is so far inferior to that of Denmark. Many of the Norwegian authors, Björnsen and Ibsen among others, invariably publish their works in Copenhagen, in order to reach a larger circle of readers, and possibly, too, in order that their books may have a better dress. It is interesting to note in this report that memoir literature is greatly on the increase in the North. Periodical literature more than holds its own in Denmark, and the decrease in the book production is undoubtedly due, for the most part, to this fact.

M. Grandidier, of the Académie des Sciences, offered last month to the Academy a note upon the origin of the name of Madagascar, which he maintains, in spite of all contentions, is not a name that was given to the island by its aborigines. The island that Marco Polo describes under the name of Madagascar, or Magastar, the country of Magdocho, was situated on the east coast of Africa, a little north of the equator. Martin Behain, misinterpreting Marco Polo, set down on his celebrated globe of 1492 a great imaginary island to which he gave the name. When the Portuguese discovered our present Madagascar (Isle St. Lawrence it was first called) in 1500, the geographers set it down in its proper place, but made no change in Martin Behain's island. This last was soon found, by navigators who sailed over its site, to be non-existent. Finally, the cartographer Oronce Finé, in 1531, put the two islands down as one, under the names of Madagascar, or St. Laurent, and to him, according to M. Grandidier, the present misnaming of the island is due.

Since the record of the will of Col. John Washington, the immigrant, was copied and produced in these columns by Mr. M. D. Conway, the original document has been discovered, and will be sold, we understand, next month in Philadelphia. A copy has been made by Dr. J. M. Toner, and will doubtless soon be published in comparisou with the more or less mutilated record.

There is an odd blending of ancient and modern in the copy of *Al-Mokattam*, the leading Arabic daily of Cairo, for January 20, 1891, with a leading article on "George Bancroft, Statesman, Historian," on the morning after the cable announced the death of Mr. Bancroft. But quite as startling are two cuts by way of advertisement, one of a well-known American hair-restorer and another of a prestidigitateur's performance.

The School of Political Science, Columbia College, is about to begin the publication of a series of monographs under the general title, "Studies in History, Economics, and Public Law," chosen mainly, but not exclusively, from among the doctors' dissertations of the School. They will be published at irregular intervals, but will be paged consecutively. "The Divorce Problem" and "History of Municipal Land Ownership on Manhattan Island" are the topics of the first two numbers.

The American Economic Association, whose Secretary is Prof. R. T. Ely, Baltimore, offers prizes for essays on the improvement of country roads and city streets; Col. Albert A. Pope of Boston supplying the sum of five hundred dollars for two prizes of $300 and $200 respectively. The essays should not exceed 25,000 words, had better be type-written, and must be in the Secretary's hands by November 15, 1892, with fictitious signatures.

—The first number of the *Economic Review*, "published quarterly for the Oxford University Branch of the Christian Social Union," made its appearance in January. The *Review* is to be devoted primarily to the discussion of the moral aspects of economic questions and economic principles; and the spirit in which this task is undertaken, as shown both by the brief editorial "programme" and by the character of the articles, is such as to warrant the expectation of much useful service in a region which is to-day of paramount interest and importance. For it is plainly not at all contemplated by the conductors of the *Review* to offer to their readers the flowing generalities of theoretical morality as the solvent of those practical difficulties which now more than ever beset those who wish to think truly and act justly in economic matters. The editors will, therefore, not endeavor "to draw a sharp line between the spheres of the economic moralist and of the scientific economist"; and they even hope to make their journal a meeting-ground for the adherents of opposing methods in economics, in the belief (which we consider well grounded) that they have much more in common than is generally supposed, and that the helping on of a better understanding between them would be a great service to economic study. The articles, which are all signed, evince in every case a spirit of candor and moderation which deserves high praise; but some of the principal articles are disappointing by reason of a want of strength or fibre. This is true of "The Ethics of Money Investment," which is well enough as far as it goes, but really leaves the question just as it finds it; "The Moral Factor in Economic Law," which lacks clearness; and "The Progress of Socialism in the United States," which, while it conveys a considerable amount of information, is too loosely put together to give one a coherent view of the situation; and this looseness is reflected in a large number of verbal inaccuracies, such as (Ely's) 'Socialist Aspects of Christianity,' instead of 'Social Aspects'; "Senator Ingolls [*sic*] spoke in the *House*"; "Brooke farm," etc. There is an able article on "Some Economic Aspects of the Eight-Hour Movement"; and the scope and utility of the *Review* may be indicated by stating that it contains, besides, articles on "The Educational Value of Coöperation" and on "Locke's Theory of Property," several vigorous book-reviews, Notes and Memoranda, and what promises to be an extremely useful department giving summaries of "Legislation, Parliamentary Inquiries, Official Returns." What is said in this last department in connection with a Parliamentary Report on Children's Life Insurance makes painful reading.

—Some light has at last been thrown on the puzzling question lately raised by us in regard to the various dates assigned for the death of Margaret Fuller Ossoli. Comparison of different copies of the original edition of her 'Memoirs' by Emerson, Clarke, and others (2 vols., Boston, 1852), shows conclusively that the original mistake was made there, in assigning (vol. ii., pp. 341–42) July 15 as the date when the *Elizabeth* reached the Jersey coast, and July 16 as the date when she was wrecked. The error was apparently at once discovered and quietly corrected in the plates, for most of the copies of that edition have the dates correctly given as July 18 and 19. But the first mistake got itself perpetuated, apparently, in the cyclopædias and other books of reference, and none of their editors seem ever to have referred to the later editions of the original Memoirs, or to the two Memoirs more recently written, all of which give the correct dates. The only exception we have yet encountered is in Mrs. Sarah K. Bolton's 'Girls who Became Famous,' where the true date is given. It is all a curious instance of the difficulty of converting history or biography into an exact science.

—A distinguished general of our civil war writes to us of the great soldier just taken from us:

"One who served as a subordinate, near to him, may be permitted to say that, when the war closed, had it been a question among his subordinates whom they would follow in another great campaign involving their lives and the fate of their country, they would unhesi-

tatingly have answered, Sherman! With him they felt sure that great results would be secured with the least expenditure of the country's greatest treasure—the life of its patriotic soldiers. His mingling of careful thought and intellectual plan with his strong blows and unflinching tenacity gave the constant and encouraging stimulus of the conviction that too much was not paid for our victories, and a succession of them would not undo us. And then to see the brusque and soldierly abruptness of common intercourse change in the fire of a great battle to a well-poised and elegant politeness—to see the quiet and calm thoughtfulness overspread his face when great things hung on the order he was to give; to feel that a great mind and heart were working more grandly under the strain of a supreme crisis in war—all this begot a faith and a courage which taught men by personal contact the value of a hero, and stimulated a personal love that made them willing to follow him out of the world in the storm of battle, or to go at his beck."

—In the tons of chaff scattered broadcast at the expense of the national Treasury, it is gratifying to find now and then a few grains of real value. With characteristic Congressional wisdom, however, the good books printed for the Government are apt to be issued in such a small edition as to be practically out of reach. Here, for example, is a series of bibliographies on the languages and customs of various Indian tribes, of each of which only a hundred copies are printed. In the particular case of Mr. Wilberforce Eames's 'Bibliographic Notes on Eliot's Indian Bible, etc.,' a very limited reprint will make its value known to bibliographers and to students generally. Mr. Eames gives a brief statement of the principal events of Eliot's life, of his labors among the Indians of New England, and of his translations into their language. He sketches the conditions upon which the work was carried on, first as an individual enterprise and then with the help of the 'Propagation Society,' and he gives the details of the expense and number of each issue of Eliot's various translations and an account of his other works. Then, with the true zeal and spirit of a professional bibliographer, Mr. Eames traces the history of these books, showing how soon they ceased to have any value for the Indians, who soon died out, and how for a century or more the books were neglected as having little or no value. Then he shows the gradual rise of a zeal for collecting Americana, so that the Bible, which originally cost seven shillings and sixpence—the copy in the Congressional Library has the price marked on the second title—is now eagerly sought for and bought after sharp competitions at $1,200 or more, and he follows the fate of well-known individual copies from hand to hand and from one collector to another. A few early copies, some in the original binding, are still piously preserved, and their story too is clearly told, while, as if by way of contrast, we see what it cost the sixth lineal descendant of Eliot himself to get a copy to present to his sister, in whose collection it naturally takes a prominent place. Then we are shown the voracious collector typified in Brinley, at whose sale his half-dozen copies were eagerly bid up, and on the other hand the conservative love of books displayed by John Carter Brown and Robert Lenox, from whose libraries the copies bought by their founders have not been allowed to go. Mr. Eames corrects some slight errors of the greatest authority on this and many other recondite subjects, Dr. J. Hammond Trumbull of Hartford. He notes the somewhat significant fact that while the second edition was still a new book as times went then, it had the odd fortune of being put under an interdict by Pope Clement, lest it should be spread through the Roman Catholic natives of the South American colonies. Perhaps equally noteworthy is the fact that one of the printers was an Indian educated at Harvard, and to his care was due the good proofreading.

—We have received from the Librarian of the Tokyo Library and Tokyo Educational Museum in Uyeno Park, Tokyo, a very interesting little pamphlet of 124 pages, 70 of which are in Chinese and Japanese and the remainder in English. It is a catalogue in summary of the books, as they are now arranged on the best American plan, in this Government library. In the addition to the treasures which are to be unlocked only by those who are familiar with Chinese characters and the Japanese *Katakana*, and of which a large part consists of history, there is an exceedingly well-arranged collection of works in foreign languages, chiefly English. These have been catalogued by Mr. I. Tanaka, who spent several months among the libraries of the United States and Europe, and has now applied to this, the chief collection of books in Japan, the methods of classification which experience in the Western World has proved to be so excellent. In the little pamphlet before us, only those foreign books which relate to Japan have been catalogued singly. The others have been grouped under special headings and subdivisions. Further, all Encyclopædias, Dictionaries, and works of reference, as also the foreign and Japanese Bibliographies and Catalogues, are arranged in special groups. A list, too, is given of the chief foreign periodicals which are taken in the library. The little pamphlet, though so modest in size and weight, is an earnest of the work that is yet to be done in exploring the region of the printed sources of knowledge in Japan. Mr. Tanaka has already begun Japanese bibliographies of special subjects, in which the literature of Japan is notably rich. Suggestions to this effect have been made by American scholars, and the work will be followed up as thoroughly as the time and money at the command of the librarian will admit.

—We note with pleasure the appearance of a new edition of the Old High German 'Monsee Fragments' by an American scholar, Mr. G. A. Hench, the publisher being Karl J. Trübner of Strassburg. It is, to be sure, a work for the specialist in Germanic philology, but as it is a pioneer venture of American scholarship into a field hitherto left altogether to the Germans, a word or two concerning it may not lack interest for the general reader. The 'Monsee Fragments' consist of the mutilated remains of a ninth-century codex which contained Matthew's Gospel, two anonymous homilies, a tractate of St. Isidore, and a sermon of St. Augustine; all in Old High German with the Latin original accompanying. The codex appears to have been written, according to the editor, in the early part of the ninth century at the monastery of Monsee in Austria. In the fifteenth century it was cut up and used for binding other codices. Towards the end of the eighteenth century these codices, together with the rest of the Monsee collection of books, were incorporated with the Imperial Library at Vienna. Here the mutilated MS. remained unnoticed until 1834, when it came under the eye of the librarian, Stephan Endlicher, who at once discerned its importance and communicated his discovery to Hoffmann von Fallersleben. The two then searched for the pieces of the codex, pieced together and deciphered what they found, and published such fragments as, when put together, made a considerable part of a page. A later editor, Massmann, added other fragments, but allowed numerous errors to creep into his work. In 1868 two more fragments were found and published by themselves. Portions of the manuscript were collated for a new edition by the late Prof. Scherer, but a new and careful collation of the whole remained a desideratum. Mr. Hench, by using a magnifier and holding the parchment up to the light, has, in spite of time, succeeded in reading the MS. more closely than any of his predecessors, and correcting many errors of omission and of commission. The text is accompanied by a grammatical treatise and a glossary. The whole, it may be added, is preliminary to a new photo-lithographic edition of the Old High German Isidore, which Mr. Hench is preparing in the intervals of professional duty at the University of Michigan. The Isidore has already been announced by Trübner as a forthcoming number of the well-known series, "Quellen und Forschungen."

—In November last the discovery of the original codex of Luther's 'Meditations on Christ's Passion' (*Betrachtungsbuch über das Leiden Christi*) was announced by the German press and created considerable excitement in antiquarian and artistic circles. It consisted of silver plates containing the text and numerous illustrations and arabesques exquisitely engraved, alternating with leaves of parchment adorned with exceedingly fine drawings. It was assumed to be the work of the famous engraver Heinrich Aldegrever of Soest, and a gift of the Elector to the reformer. Offers of purchase came from various persons, among others from the Duke of Saxe-Coburg and the German Emperor. No expert, not even the cautious and experienced Director of the Prussian Museums, Dr. J. Lessing, seems to have entertained the slightest suspicion of its genuineness. At length Prof. Wormstall of Münster, in Westphalia, began to express doubts, and his skepticism was soon shared by other connoisseurs. In consequence of the discussion thus called forth, the codex was placed on exhibition in Münster, where a young man named Karl Flüthe from the neighboring town of Telgte saw it and declared that he had made the whole of it, including the carved ivory cover, and, what was more, proved his astounding assertion by producing several of the first draughts of the designs. He then stated that during the last two years of his apprenticeship to the engraver Heck of Münster this work was given him to do by his master "for practice," and that he was kept so busily at it that he often complained of this severe task to his parents when he visited them. He had no idea of the intentions of his master in having these engravings made, and never knew what had become of them until he saw them in book-form. His models were originals of the sixteenth century contained in numerous works which his master either owned or borrowed. Heck has been arrested, and not only admits the truth of his apprentice's story, but also confesses that he has fabricated many "antiquities" in this manner and made money by it.

LESLIE'S OLD SEA WINGS.

Old Sea Wings, Ways, and Words, in the days of Oak and Hemp. By Robert C. Leslie. With illustrations by the author. London: Chapman & Hall; New York: Scribner & Welford. 1890.

It is with a feeling of regret that the timeliness of this book must be acknowledged. Old things are passing away in the sea-going world; the introduction of steam, the use of steel and iron in construction, and the multi-

plicity of complicated machines on board ship, have made great changes in the vessels that now go into deep water; and, alas, with the disappearance or diminution of sailing craft, built or framed with oak and rigged with hemp, goes much of the romance of sea-going as well as of the poetry of motion. This book, then, serves a useful and interesting purpose in keeping alive, by print and picture, the memories of ships and rigs gone or passing away, and, by recording the traditions and language of the sea and seamen, forms a link between the past and present. It is most fortunate that one so competent as Mr. Leslie proves himself to be, both with pen and pencil, has undertaken this somewhat technical work, which, with his evident tastes, must also have been to him a labor of love.

For many years sailing-vessels have given up the rôle of mail and passenger-carriers, and have been relegated to the duty of carrying freight alone; and since the appearance of the economical freight steamer of the type to which the name of "tramp" so closely clings, their work in this capacity is being restricted more and more to coarser and bulky cargoes and to the least profitable trades. One important trade, however, is left to sailing-ships, and that is the carrying-trade between England and Australia, in which the brave westerly winds in the "roaring forties" serve as a rapid and reliable means of passage. In this trade, outwards by the way of the Cape of Good Hope, and homeward by the way of Cape Horn, are to be found the best and most modern types of the sailing-vessel of the day.

The author traces through many and various stages the development of the ships and sailing-vessels of the present from the earliest known times, giving as one germ the flying proa of the Friendly Islands (known to modern geography as the Tonga group). He finds with some reason, in this primitive rig and sail, a resemblance to the wings of a flying bird. The evolution of the modern frigate-built ship is also traced in its varying stages from the xebec and galley of the ancients. The outgrowth of the yachts of the present day, both American and English, is also shown—the English cutter from the old king's and revenue cutters of former days; the American sloop yacht from the Hudson River sloop; while as progenitor of the *America* and *Sappho* type of schooner-yacht he names the New York pilot-boat. The conservatism of the sea still gives the name of revenue cutter to the steam and other vessels of our revenue marine, which are utterly unlike the revenue cutter of the eighteenth century.

The adaptation of sail, spar, and hull to local conditions of wind, weather, and topography is sketched in a readable way in the fifth chapter, excellent examples being found in the Scheveningen boats, the Italian lake craft, and the dahabeeyah of the Nile. Cases actually exist, however, as in San Francisco, where Italians import with themselves the characteristic craft of the Mediterranean, meeting occasionally vessels rigged Chinese-fashion as representatives of the extreme East and of a still older civilization. As another verification of the saying that there is nothing new under the sun, we read with interest a quotation from Le Compt, the Jesuit who, in 1690, writing of certain boats used by the Chinese for passing dangerous rapids among rocks, says: "They divided them into five or six apartments, separated by good partitions, so that when they touch at any place upon a point of rock, only one part of the boat is full, whilst the others remain dry, and give time to stop the hole." It is a singular fact, also, that the Chinese junks, notwithstanding their lumbering appearance, can, from the construction of their sails—matting stretched on bamboos—trim their sails and lay their course closer to the wind than the ordinary craft of other maritime countries. The Bermuda pilot and sail-boats are their nearest rivals, as they claim to be able to trim their booms to 15° and to be able to work readily within eight points. In treating of characteristic sail-boats the author fails to notice one distinctively American sail-boat—the cat-boat—so prevalent in and about Newport and the enclosed bays on the south side of Long Island.

We find two chapters devoted to figure-heads of ships, and, written and illustrated as they are in a most pleasing manner, they are certainly among the most entertaining in this interesting book. Wood-carving fostered in seaports by the demands for figure-heads and elaborately carved gangway boards has become almost a lost art. Of the vessels in our navy the only one in service that can be recalled with a figure-head is the *Thetis*, which carries upon her bows an effigy of the mythical mother of Achilles. Upon the departure of this vessel for her last Arctic cruise from Mare Island, this figure-head was the recipient of many floral gifts, the bright color of the California roses contrasting vividly with the pure white of her drapery.

Among other matter which the author has unearthed from the old sea literature which is to be found in England, is a narrative of the loss of the *Royal George* which will be new to many. This account, written by a survivor in the old *Penny Magazine* in 1834, states that the loss occurred as follows:

"The ship was inclined at an angle of between twenty and thirty degrees, her top-gallant masts on end, and the ship in charge of a second or third lieutenant. Admiral Kempenfeldt, of the blue, then over seventy, was being shaved in his cabin by the ship's barber, while most of the hands below were busy stowing rum casks—hoisting them in from a lighter lashed to that side of the ship into which the short spit-head sea was already washing through the lower deck ports; these ports having to be all open to allow the great guns to be run out on that side to help give the ship the required heel. Yet, so far, no anxiety about the stability of the ship seems to have been felt by any one; and, sailor-like, the men on this lower deck 'were enjoying,' says the writer, 'a rare game, hunting mice that had been driven up from below by the water in the ship's bilge.'

"The carpenter, who was superintending the work outside the ship's bottom, appears to have been the first person to think it time to make some change in the ship's position, and mounted to the quarter deck to ask the lieutenant in charge to give the order 'to right ship.' The lieutenant, however, gave him a very short answer, and the carpenter left the quarter-deck, but soon afterwards returned and repeated his request and warning. This time the reply was, 'D——e, sir, if you can manage the ship better than I can, you'd better take command.' However, shortly afterwards the lieutenant ordered the drummer to be called to beat 'to right ship.' It was too late, for, the writer says, 'there was no time for him to beat his drum, and I don't know that he even had time to get it.'"

A very wide range is taken in this book in its treatment of nautical subjects, the author entering into the much-discussed subject of the advisability of the modern cruiser carrying sail—a matter occupying naval minds both here and in Great Britain. Our lack of coaling stations makes it more pertinent to us even than to the English. However, we think the rôle of commerce-destroying will have to be conceded by Americans to be as impracticable for our navy as it is inefficient in its vital effect upon a maritime war.

For a layman, the author of this book is wonderfully correct in his illustrations and technical discussions and definitions. We have detected but a few errors or omissions. In his description of the mainsail he is hardly right when he states that the clews change in name when a ship goes about. The clew becomes a weather or lee one as the ship tacks, but it remains always the clew; and the rigging hauling it aboard or aft is changed—not the name of the clew of the sail. The author may have been misled by the expression that the ship is on the "starboard or port tack," which arises from the more correct and longer expression that the ship has its "starboard or port tacks aboard." On page 184, Nelson's Captain is referred to as his sailing-master, the words, "Anchor, Hardy, anchor!" having been addressed by Nelson to Hardy as the Captain of the *Victory*. In the definition of the nautical manœuvre of easting, we notice an incompleteness as it refers only to a fore-and-aft-rigged vessel. These, however, are but slight blemishes in a book singularly successful and interesting. It will be gratifying to those whose profession is that of the sea, or those who are interested in the persons and craft that go upon the sea, to find this subject treated in so sympathetic and genial a manner by a layman so competent and accurate. The illustrations are both numerous and successful. The book should be a favorite with intelligent yachtsmen, and have a place in the library of every yacht-club.

Alexander Hamilton. By William Graham Sumner, LL.D. Dodd, Mead & Co.

In this volume, which fills a niche in the series devoted to "The Makers of America," Prof. Sumner has endeavored critically to ascertain the distinctive character and function of Alexander Hamilton, considered as a constructive statesman, by first endeavoring to ascertain his peculiar place in our political history. The author holds that it is only by a study of the social and political environment in which Hamilton was called to play a leading part, that we can explain to ourselves the reason and ground of the paramount rule of conduct which he so uniformly prescribed to himself in seeking to infuse greater energy into the structure and administration of the Federal Government. Prof. Sumner shows at great length and, as it seems to us, with entire conclusiveness, that this policy of Hamilton had its rational explanation, if not always its complete justification, in grave disorders of the time dating from the outbreak of the Revolution. It is shown that the anarchic methods allowed to themselves by the patriots of the Revolutionary period, in dealing with royalists and with "suspects," had for their natural effect to work a gradual, but, in the end, a deep-seated, distemperature of the whole body politic, and that under the influence of this distemperature the people grew intolerant of law and order precisely in proportion to their need of an energetic government to protect them from themselves. Not only were the institutes of law and order rudely shaken by the violent separation of the colonies from the mother country, but the very cement of society was in danger of being destroyed by arbitrary processes of mob-law extending through the length and breadth of the land at the will of irresponsible committees, acting in the name and under the color of "patriotism."

In order, therefore, to find the place of Hamilton in our annals, Prof. Sumner portrays with much minuteness the special defects and faults of American public life from 1765 to the formation of the Constitution. Such an exposition, as he rightly conceives, should be the

background for the portrait of a statesman who deliberately and of set purpose devoted himself to the task of reëstablishing the institutes of stable government on a soil still quaking from the shocks of civil war and intestine feud. The captious reader might perhaps object, on grounds of literary art, that the author has bestowed more care and labor on his background than on his portrait, but the cavil would be more nice than wise, for it is only by the aid of such an elaborate background that the striking traits of Hamilton as a "maker of America" can be put on the historian's canvas with sharp definition and due proportion of parts.

Dr. von Holst has complained that the American people are too much disposed to canonize the heroes of the Revolution and the founders of the Constitution. In like manner it is common to assume that whatever the American people did in bringing on the Revolution, and in conducting it to a successful conclusion, must be held up for laudation and never for historical criticism. Hildreth, it is true, boldly avowed in the preface to his history that he meant, "for once," to present the founders of the American nation "unbedaubed with patriotic rouge," and we are glad that Prof. Sumner has followed the example of Hildreth by throwing his rouge-pot out of the window before sitting down to give us a pen-and-ink sketch of Hamilton in his political surroundings. The sketch gains verisimilitude in gaining truth and reality.

With all the freedom of his criticism, the author does full and frank justice to the elements of greatness in Hamilton's career. It may even be said that he exalts that greatness by showing that the whole theory on which Hamilton acted, as an "apostle of energy" in government, was untarnished by ideas of personal interest and selfish ambition. He deliberately took the unpopular side in a day of political giddiness and revolt. He took this side because, to borrow the word of Talleyrand, he "divined" that America (as well as Europe after the convulsions of the French Revolution) required a strong government for the repression of anarchic tendencies which had struck a deep root in American soil.

It need not surprise us that in testing the economic and financial opinions of Hamilton by the light of modern economic science, Prof. Sumner finds it easy to show that the notions of the great Federalist leader were often crude and superficial, as might be expected in the case of a man who had been early caught in the meshes of the then current mercantilism, and who, under the exigencies of his busy professional and public life, could hardly find time for the profound study of economic problems. Nothing in the writings of Hamilton can be cited to show that he had ever read a line of Adam Smith or of the French economists who preceded him. The biographers of Hamilton hitherto have not been economists or financiers. They have taken him on trust in this particular, one after another, and, being blind leaders of the blind, have here fallen into a ditch.

The special measures of administration with which the fame of Hamilton is identified—the Funding System, Assumption of State Debts, the National Bank, etc.—are examined by Prof. Sumner with no fault-finding spirit, but with that critical incisiveness which belongs to a writer who holds clear and strong opinions in political economy, and who always has the courage of his opinions. We wonder, however, that in professing to "have subjected Hamilton's opinions on economic, and more especially on financial matters, to a thorough examination and criticism," he should have omitted all reference to the testimony which the great "apostle of energy" has left behind him against the cheap but perilous expedient of paper money issued by authority of Government, whether with or without the quality of legal-tender. Hamilton should have had the credit of his perspicacity in this matter, if only the better to gauge the lapse of our first disobedience under this head.

We could wish that the literary style of this work were always as correct as it is vigorous and expressive. The sentences are sometimes so careless in their structure as to suggest that the writer has a disdain for literary form. Sometimes, too, this carelessness strikes deeper, as when (p. 243) we stumble on a passage like the following, purporting to be a citation from the writings of Hamilton: "I will here express but one sentiment, which is, that dismemberment of our empire will be a clear sacrifice, of great positive disadvantages, without any counterbalancing good, administering no relief to our real disease, which is democracy, the poison of which, by a subdivision, will only be the more concentrated in each part, and consequently the more virulent." Readers who know their Hamilton are likely to resent such a mangling of his text. What Hamilton wrote was this: "I will here express but one sentiment, which is, that dismemberment of our empire will be a clear sacrifice of great positive advantages, without," etc.

The French Invasion of Ireland in '98. By Valerian Gribayédoff. New York: Charles P. Somerby. 1890.

THIS volume is, in the words of the author, "an effort to rescue from comparative oblivion one of the many extraordinary episodes of the great French revolutionary war"—Humbert's descent upon Killala in August, 1798, with but 1,100 men of all arms, his maintenance in the field for three weeks in the face of great difficulties, his defeat of superior forces brought against him, his march of some 120 miles for the Irish capital, and his own defeat and surrender at Ballinamuck, 50 miles in a direct line from where he landed. Mr. Gribayédoff has given himself conscientiously to his task, has consulted most available authorities and sources of information. It is somewhat surprising, however, that Grillon's 'La France et l'Irlande pendant la Révolution,' published in 1888, appears to have escaped his attention. He has not added much to our knowledge of the episode, but he has produced an eminently readable and useful book, that should find a place in every library making any pretensions to completeness regarding British history. Its publication will leave no excuse for any responsible person again stating, as our author says Lord Wolesley did on a late occasion, that "the United Kingdom had not been insulted by the presence of an armed invader since the days of William the Conqueror." The illustrations are admirable and emphasize the spirit of the text: one at page 136, is peculiarly affecting, where an advanced sentinel of the finally victorious British force looks out over a lonely lake and ruined cabin on a hillside dotted with the bodies of the unfortunate Irish auxiliaries slaughtered in cold blood after Humbert's surrender.

After having read this book in conjunction with the wider view of the episode afforded in the twenty pages which Mr. Lecky devotes to it in the thirtieth chapter of his 'England in the Eighteenth Century,' the ordinary student of history may rest satisfied that he has a tolerable grasp of the subject. The most interesting points brought out by the narrative are the extraordinary spirit and effectiveness of the unkempt Republican levies of which Humbert's force was principally composed; the entire unpreparedness of Ireland for serious revolt, even considering the desperate valor which after a short time was infused into a considerable number of those who joined the invaders; the barbarous ferocity meted out to the miserable peasantry of the occupied district after the surrender, and, hence, the quenchless fountains of bitter memories opened in the hearts of the people. Bishop Stock of Killala and his family were from the first and all through prisoners in the hands of the French and their allies. His 'Narrative' will ever form the basis of any effective history of the transactions. Those who seek to make out the nature of Irishmen to be different from that of ordinary mortals, would do well to ponder upon much that the Bishop has written. "During the whole time of civil commotion not a drop of blood was shed by the Connaught rebels except on the field of war." "The rapacity [of the victorious British troops] differed in no respect from that of the rebels, except that they seized upon things with somewhat less ceremony and excuse, and that his Majesty's soldiers were incomparably superior to the Irish traitors in dexterity at stealing." Our author might have added another to the many forcible extracts he has made from the Bishop's Narrative from the pages where he tells of how he was justly reproved by one of the rebels for speaking lightly—as "only a few cabins"—of the houses of the people being burned by the King's troops.

Of all the many planned French landings in Ireland in 1797-8 Humbert's was the only one that reached fruition. It came at about the most inopportune and hopeless period in the contest between the United Irishmen and the Government. Yet we must confess that we rise up from Mr. Gribayédoff's book with the conviction that none, even the most powerful of them, would have been at all likely in the end, under any circumstances, to have succeeded. So far, Irishmen have little cause for self-satisfaction in the outcome of combined revolutionary movement in their own country; they have ample basis for it in the individual heroism displayed all through their history—even in the sad episode with which the book before us is concerned.

Life of Arthur Schopenhauer. By Prof. W. Wallace. London: Walter Scott. 1890. Pp. 217.

SCHOPENHAUER was not an amiable man. He was generally in a querulous mood towards the whole world in general and almost everybody in it in particular. Not even with his mother did he live on amicable terms. Before he parted with her she avoided meeting him, and they communicated with each other by letter, though living under the same roof. In 1814 they separated, and he never saw her again, though she lived twenty-four years longer. When Feuerbach wrote in his memoirs: "Madame Schopenhauer, a rich widow. Makes profession of erudition. Authoress. Prattles well, and intelligently; without heart and soul. Self-complacent, eager for approbation, and constantly smiling to herself. God preserve us from women whose mind has shot up into mere intellect"—Schopenhauer agreed that this silhouette was true to life, and remarked that "he could not, God forgive him, keep from laughing." It must be remembered, however, that for this state of affairs the fault lay largely with Frau Schopenhauer, who, at the age of forty, took up the literary profes-

sion, when her mind, which had never been domestic or emotional, "shot up into mere intellect."

In other respects, too, the acrid pessimist had only too good ground, personally speaking, for despising mankind as he did. When he had finished his principal work, 'The World as Will and Idea,' at the age of thirty, he wrote, in offering it to the publisher, Brockhaus, that it was a book "which would hereafter be the source and occasion of a hundred of other books, . . . clearly intelligible, vigorous, and not without beauty." And a few years before his death he wrote: "Subject to the limitation of human knowledge, my philosophy is the real solution of the enigma of the world. In this sense it may be called a revelation. It is inspired by the spirit of truth; in the fourth book there are even some paragraphs which may be considered to be dictated by the Holy Ghost." Whatever exaggeration of vanity there may have been in Schopenhauer, there can be no question that he is the clearest philosophical thinker Germany has ever produced, and, with the exception of Heine and Goethe, the greatest literary artist; indeed, no age or country has perhaps produced a writer who had a greater command of the power of stating a philosophical truth in picturesque, poetic language, that has the effect of a ray of electric light illuminating a dark corner of the mind. He knew at that time, as we all do now, how superior he was in these gifts, as well as in independence of thought, to Schelling, Fichte, Hegel, and the other university professors of his day, with their obscure artificial systems, vainly struggling to break through the meshes of the theological web which had so long been spun around free thought. Yet how did the world treat him? The answer to this question constitutes one of the most shameful chapters in the story of what is the greatest blot on the German name —the disgraceful treatment of their men of genius during their lifetime.

'The World as Will and Idea,' which, like Plato's 'Republic,' will be read 2,000 years after its author's death, was published in 1818; yet although only 800 copies had been printed, the second edition did not appear till twenty-six years later, when its author was already fifty-six years old; and, what is worse, when he wrote to the publishers, inquiring about the sales of the book, he was informed by them that the greater part of the edition had been disposed of at waste-paper price. The second edition, indeed, was only launched after Schopenhauer had agreed to ask no remuneration for it. Seven years later his second great work, the 'Parerga und Paralipomena,' which was destined first to popularize his name, was refused by three publishers, and was at last brought out only through the efforts of a friend, Schopenhauer receiving eight free copies as sole remuneration for the two volumes! It was not till the very last years of his life that a few signs came to him that his real greatness as a thinker and writer was beginning to be appreciated. His lectures on philosophy in Berlin had also been neglected by the students, while those of the "charlatan" Hegel attracted such eager crowds that some of the hearers made their way into the lecture-hall by the window. So little was Schopenhauer's greatness understood that, even during his latter years, at Frankfort, "he was better known as the son of the celebrated authoress Johanna Schopenhauer than for his personal merits."

All these things surely afforded some legitimate cause for practical bad temper and theoretical pessimism, especially in the case of a writer whose inherited bump of vanity was so abnormally developed. They also serve as some excuse for his special contempt of his countrymen and his well-known Anglomania, which he showed by his constant reading of the *Times*, by associating on his travels almost entirely with Englishmen, by using the English language in his account-books, etc. If, in the street, any one diverged to the left, he would exclaim, "Why don't the blockheads turn to the right? An Englishman always turns to the right." He felt so sure of his command of the English language that he proposed at one time to translate Hume, and in 1829 he wrote a letter to the editor of the *Foreign Review and Continental Miscellany* offering to translate three of Kant's works; one of the chief claims urged by him being that "a century may pass ere there shall again meet in the same head so much Kantian philosophy with so much English as happen to dwell together in mine." Yet he was doomed to another disappointment—not even as a translator was he to be encouraged and appreciated. Perhaps we should add, as a further mitigating circumstance which must affect our estimate of his character and teachings, that he came of a naturally irritable stock. The theory that genius and insanity are cousins is illustrated in his case by the fact that, besides himself, his mother and his sister were gifted writers, while, on the other hand, an uncle of his was an imbecile from his youth up, and his father was under suspicion of having committed suicide. We might even find some cause, if not justification, of his especial contempt for women in the information that "the damsels in the drawing-room [at Weimar] would giggle at his grim gaucheries, and even the reproof of a Goethe would hardly convince them that this silent and unapproachable youth could be worth serious attention." Goethe's early appreciation of Schopenhauer's intellect is one of the few redeeming features in this picture of Germany's ignoring of one of her greatest geniuses. On the other hand, Prof. Wallace draws up an interesting comparison (p. 142–3) between Goethe and Schopenhauer on their travels in Italy, the poet filling his letters with objective sketches of all he sees and does, while the philosopher fills his note-books with moral and pessimistic reflections which might have been written anywhere else just as well.

Prof. Wallace's biography is based, of course, on the works of Gwinner and Frauenstädt, and though it also attempts to give a résumé of Schopenhauer's principal writings, it was obviously impossible, in the short space at command, to do this in a very satisfactory way, and the interest of the volume, therefore, centres in the biographic portions, the most readable of which is the section on Schopenhauer's personal habits in later life. "Whereas, as a general rule, his life, like his philosophy, was modelled on the lines of Kant's example, he regarded Kant's early rising as a wanton waste of vital energy, avenged by the dotage of his declining years." How far Schopenhauer's prophecy, that his great work would hereafter be "the source and occasion of a hundred of other books," has already been realized, is shown by a useful nine-page appendix, containing a catalogue of books and articles by and on Schopenhauer, which, though less complete than Laban's 'Schopenhauer Literatur' (123 pages), covers the more important writings on the life and works of the famous pessimist.

The Antiquities of the State of Ohio. By Henry A. Shepherd. Cincinnati: Robert Clarke & Co. 1890. 4to, pp. 139. Illustrated with maps, plans, views, and relics.

THIS volume forms a part of the 'Popular History of the State of Ohio,' and the author's object was to bring together, in a compact shape, the information which he found floating around in regard to the works of the mound-builders. To this end he republishes the accounts of a number of recent explorations, though it is upon Squier and Davis's monumental work that he chiefly depends. Naturally enough, there is a varying degree of merit in these different publications. Some of them are good, some have been superseded by later surveys, while others are so full of speculations as to the origin and uses of these structures as to impair the value of those portions of the work which are purely descriptive. Moreover, it must be remembered that in some instances these accounts do not agree even in so simple a matter as the measurements of length and breadth, and hence, to assert, as is done in the title-page, that this is a "full and accurate description of the works of the Mound-Builders," is, to say the least, premature.

We might also take exception to the statement in the publishers' preface that "there can be little doubt that a people much superior to the Indians once occupied the central portion of the United States." Theoretically, we suppose, there is no reason why a "publisher" should not be a competent judge in an ethnological matter, provided he has sufficiently studied the subject; but when a "publisher," speaking as such, favors us with an *ex-cathedrâ* opinion upon a point about which students differ, we may be excused for reminding him of the proverb which enjoins a shoemaker to stick to his last. In the present instance, this course is the more justifiable because, unless we are mistaken, one of the publishers has done more or less work in the kindred science of archæology, and, consequently, he must have known that a number of ethnologists do not admit that the central or any other portion of the United States was ever inhabited by a people superior to, or different from, the recent Indians. In fact, it is believed to be within bounds to assert that the tendency, to-day, is to the opinion that the mounds and earthworks of the Ohio Valley of every sort and description were quite within the range of the efforts of the recent Indians.

Les Origines de la Restauration des Bourbons en Espagne. Par A. Houghton. Paris: Librairie Plon. 1890.

THIS substantial volume of 400 pages is ostensibly only a political history of Spain for the year 1874, yet its author, a veteran newspaper correspondent, brings to his task such a prolonged and detailed acquaintance with Spanish affairs that his book goes far towards lighting up the dark places in the whole political movement of modern Spain. M. Houghton was an eye-witness of many of the events which he describes, and has had the advantage subsequently of intimacy with many of the leading actors in the rapidly shifting scenes of a crowded year, so that his narrative is as impartially accurate as we are likely ever to get. When Castelar's history of the period comes out, it will be fuller, but can hardly fail to be more partisan.

The year opened with the Republic, born out of due time, in a critical condition, owing to the bitter and imbecile wrangling of the leaders who had brought about its establishment. Castelar appears to have done all that a mortal could during the period of his Presidency, but

could not command a majority in the Cortes. When the vote of want of confidence was passed, in spite of his eloquent defence of his Administration, the triumphant Opposition were suddenly thunderstruck by a message handed to the presiding officer by an aide-de-camp of Captain-General Pavia, setting forth that soldier's "regret at finding himself under the sad necessity of urgently begging the President of the Assembly to order the Deputies to leave the Hall of Sessions." This *coup d'état* of the bluff Captain-General was very neatly executed, but was a bungling piece of work after all in its larger relations, as the worthy soldier did not know what to do with the Government after he had thus placed himself at its head. He appears to have been a Republican and Liberal at heart, and to have imagined that the Republic could be consolidated and made more efficient by a new deal all around. But the only result was the quasi-dictatorship of Marshal Serrano. Then followed the months of alternate vigor and feebleness in the conduct of the campaign against the Carlists, the amazing blindness to the bold intrigues of the Alphonsists, and, finally, the other stroke by the army December 29, when Alphonso was proclaimed King at Sagunta by General Campos, and Serrano, with a curious mixture of prudence and patriotism, resolved to make no attempt to put down the spreading military insurrection, and fled to France.

This course of events M. Houghton details for us with great intelligence; but, as we have said, the chief value of his book lies in its illuminating comments on the political ideas and methods of the Spain of to-day. For example, he brings out again and again the surprising obtuseness of Spaniards to the immense evils of military interference in civil affairs. To them it seems as legitimate to overturn an administration or a government by a pronunciamiento as by outvoting it. It is mostly a question of convenience.

"When one hears Spanish officers and politicians speak with such naïveté about acts which seem so unheard-of and unintelligible in other civilized countries, one is almost ready to believe that the human mind suffers eclipses and changes due to the climate, the environment, the race, heredity, the past, traditions, precedents, and all those conditions which make up that political and military way of looking at things so peculiar to Spanish civilization, and so deeply rooted in it, even in the nineteenth century."

Much light is also thrown upon the inevitable tendency of Spanish political parties to split into warring cliques, making party government almost impossible except under the form of a coalition. A leader of the merest faction will be as haughty and *intransigeant* as if he had half the Cortes back of him. Government thus becomes a sort of guerilla warfare, the Premier who can make terms with the largest number of petty chiefs being the man to be in power, though able to stay there only until his rival can make more comprehensive combinations than his own. The Republic would not have fallen when it did but for such disgraceful squabbling within the Republican party. The real reason for Sagasta's sudden fall from power last summer was his inability longer to bid high enough for some of the free-lances that had been fighting under his banner for a time. Yet, with all this, political parties and antagonistic leaders display the greatest deference to each other. Nor is it all merely the grandiloquence of Spanish politeness. Says M. Houghton, "They treat each other quietly with the greatest regard, in order to obtain reciprocal favors when the wheel of Fortune turns against those who momentarily enjoy her smiles." For many other such suggestive appreciations, as well as for the considerable historical value of the book, it deserves commendation.

Dyspepsia

HORSFORD'S
ACID PHOSPHATE.

In dyspepsia the stomach fails to assimilate the food. The Acid Phosphate assists the weakened stomach, making the process of digestion natural and easy.

Dr. R. S. MCCOMB, Philadelphia, says: "Used it in nervous dyspepsia, with success."

Dr. W. S. LEONARD, Hinsdale, N. H., says: "The best remedy for dyspepsia that has ever come under my notice."

Dr. T. H. ANDREWS, Jefferson Medical College, Philadelphia, says: "A wonderful remedy, which gave me most gratifying results in the worst forms of dyspepsia."

Descriptive pamphlet free.

Rumford Chemical Works, Providence, R. I.

Beware of Substitutes and Imitations.

CAUTION: Be sure the word "Horsford's" is printed on the label. All others are spurious. Never sold in bulk.

THE FORUM FOR MARCH.

With the number for March, *The Forum* begins its eleventh volume. Throughout the whole period of the ten volumes now finished, there has been an uninterrupted increase of its business—an indication of the steady growth of the popular interest in the free discussion of the most important subjects of the time. The contents for March are:

THE NICARAGUA CANAL. Senator JOHN SHERMAN. An explanation in favor of a Government appropriation; the commercial and international significance of the undertaking.

SILVER AS A CIRCULATING MEDIUM. GEORGE S. BOUTWELL, former Secretary of the Treasury.

DO WE HATE ENGLAND? Bishop A. CLEVELAND COXE.

THE SHIBBOLETH OF "THE PEOPLE." W. S. LILLY.

FREEDOM OF RELIGIOUS DISCUSSION. Prof. MAX MÜLLER. A plea, from an orthodox point of view, for the fullest religious discussion.

OUR BARGAIN WITH THE INVENTOR. PARK BENJAMIN. An explanation of the practical workings of our patent system and a proposed reform.

THE RING AND THE TRUST. Rev. Dr. WILLIAM BARRY. How the consolidation of great industries is preparing the way for some form of State socialism.

RAILWAYS UNDER GOVERNMENT CONTROL. W. M. ACWORTH, a special student of English railway problems. The effects of private and Government ownership, and an argument for the former.

RUSSIAN TREATMENT OF JEWISH SUBJECTS. P. G. HUBERT, JR. A specific explanation of Russian persecution; its effect on immigration.

FORMATIVE INFLUENCES. MARTHA J. LAMB.

A NEW POLICY FOR THE PUBLIC SCHOOLS. JOHN BASCOM.

50 cts. a copy; $5 a year.

THE FORUM Publishing Company, New York.

LOANS SECURED BY DEED TO choice Macon real estate at 7%, and to improved Middle Georgia farming lands at 8% net to investors. Investments made. THOS. B. WEST, Attorney-at-Law. Macon, Ga. References: First National Bank; I. C. Plant & Son, Bankers, Macon, Ga.

Foster's Whist Manual

Cloth bound, gilt edges. Price, $1.00.

"Cavendish" says: "The system, which includes all the latest developments, is most ingenious"—*London Field, November* 1, 1890.

"There are many books that lay down rules for the proper playing of whist; but few of them seem to have as much chance of making an impression on a learner as Mr. R. F. Foster's 'Whist Manual' has. The book teaches the ordinary game by a system which is at once lucid and striking. Players will profit by a perusal of Mr. Foster's book, which is in every way an excellent manual of its subject."—*Scotsman, November* 3, 1890.

KRUELL'S CONTEMPORARY PORTRAIT-GALLERY.

"The Nation."

1865-1890.

In commemoration of the 25th anniversary of this journal, Mr. Kruell has engraved on wood, in the highest style of the art, after a recent photograph by G. C. Cox, a portrait of the founder and present editor of the *Nation,*

Edwin Lawrence Godkin.

The size of the block is 9x6 inches; the impression is on Japan paper, under the personal supervision of the artist, and is loosely mounted. *Only one hundred proofs* will be offered for sale, and each will be signed and numbered. Price, Ten Dollars, carriage prepaid. Address GUSTAV KRUELL, East Orange, N. J.

*** Mr. Kruell offers at the same price, and in the same style, proof portraits of CHARLES DARWIN (one in his prime, one in old age), ASA GRAY, WILLIAM LLOYD GARRISON, and WENDELL PHILLIPS. The edition in these cases is limited to 200 copies for all except Gray (100).

"Certainly we may look in vain among other graphic arts for anything comparable with these portraits."—The Nation, January 23, 1890.

The Nation.

NEW YORK, THURSDAY, MARCH 5, 1891.

The Week.

It is somewhat uncertain what the upshot of the Mail Steamship Bill and the Post-office Appropriation Bill may turn out to be as regards the fortunes of the steamship companies concerned. The Senate appropriated $1,250,000 for the transportation of foreign mails for one year. Apparently this puts a limit on the power of the Postmaster-General. There were some lively fluctuations in Pacific Mail shares in the stock market on Monday, betokening that the speculators are themselves in doubt how much they will get. They have calculated upon $600,000 as the portion of that company, but if $1,200,000 is the limit for everybody, they will have to take less. There will probably be some heart-burnings in the antechamber of the Postmaster-General after Congress adjourns. Whatever the Pacific Mail Company gets, over and above its present compensations for carrying the mails, will be clear gain, unless the Pacific railroads absorb the surplus by cutting down their subvention in proportion to the largess of the Government.

An intimation comes from Washington that if the Direct-Tax Refunding Bill becomes a law, two consequences will follow: First, there will be a movement in the several States to have the money distributed to the individuals who paid it, or their heirs, in order to carry out the intent of Congress. Second, there will be a movement in Washington to have the income tax that was collected during the war refunded. Surely no reason can be found for paying back the one more than the other. There is no reason why Congress should stop at the income tax. There were taxes on billiard-tables, carriages, and pianos during the war, likewise on gross receipts, on sales, on manufactures, on trades and professions, and other taxes since repealed, amounting in the aggregate to $256,000,000 in a single year. Here is a magnificent chance for refunding. The opportunity to "work" the State Legislatures to procure a distribution of the refunded direct-tax will, of course, not be neglected. Precedents will be found in the distribution of the surplus of 1837. In some of the States this money was distributed to the towns in proportion to population, and in others it was distributed to the inhabitants. In Maine, for example, each man, woman, and child received between two and three dollars. There is provender enough in this restitution to support a lobby of each Legislature for several years.

Mr. Plumb of Kansas let a good-sized cat out of the bag on Monday when he contributed certain interesting facts within his own knowledge as to the framing of the McKinley Bill. When that measure passed the House, it did not extend the sugar bounty of two cents a pound to maple sugar. Mr. Plumb stated that the clause in favor of the owners of maple orchards was added to the bill in the Senate at the request of the Vermont Senators, and he asserted that this bounty was agreed to on the statement of the Finance Committee that it would help Mr. Morrill to be re-elected to the Senate. "Republican Senators," goes the report, "were personally solicited by members of the Finance Committee to vote for the bounty on that ground. That was the reason he voted for it, and he did so with the distinct understanding that the paragraph should be knocked out in conference committee. But when the conferees took hold of the Tariff Bill, the other Vermont Senator, Mr. Edmunds, threatened, in writing, that if the maple-sugar bounty was not left in, he would vote against the whole Tariff Bill. That letter was now in the pocket of a Republican Senator, and it showed by what sort of Yankee trick the bounty had been obtained for a few persons in the little State of Vermont." Nobody questioned the truth of this interesting revelation.

Bills for the relief of the United States Supreme Court have been talked about so long without getting beyond the stage of talk, that it is a welcome surprise to find that such a measure has at last actually passed Congress. The bill creates a court of appeals in each of the nine judicial circuits, which is to consist of two of the existing Federal judges, and one new judge in each case, to be appointed by the President. The decision of these appellate courts is to be final in a certain class of cases, and thus the number of cases that can be carried to the Supreme Court will be materially reduced. It is hoped that, when the new system is running smoothly, the highest tribunal will be able to keep up with its work for the first time in a great many years, and so render speedy justice, instead of making litigants wait two or three years for a decision. The passage of this act is one of the very best things done by the Fifty-first Congress.

The nine new judges are to be appointed by a Republican President, and some disposition was manifested by the Democrats in Congress to secure a provision that some of the number should be taken from their party. The attempt to insert such a provision in the law, however, failed, as it ought to have failed, for nothing could well be imagined more abhorrent to sound ideas regarding the judiciary than the formal recognition of the partisanship of judges. A due sense of propriety should suggest to the President the wisdom of not taking all of the new judges from his own party simply because he has the power, just as the Republicans of Vermont, although they have always had the power to make their bench unanimously Republican, have been accustomed to allow the Democratic minority representation upon it. But, after all, it makes little difference whether a judge is called a Republican or a Democrat, so long as he is of the type of the late Justice Miller of the Supreme Court, who, although a Republican, was as good a States-rights man as any Democrat could ask for, and did not hesitate to annul for unconstitutionality acts passed by his own party in Congress. Happily the President has set so high a standard of judicial appointments in his selections for the Federal bench thus far that there is good reason to hope he will give the country nine good judges. If he selects men of the same type as Brewer and Brown, his appointees as Supreme Court judges, nobody will have any right to complain. Indeed, it may be said that, if Mr. Harrison had kept the general level of his Administration up to the standard of his judicial appointments, it would have been a far greater success than it actually has been.

The selection of Mr. Blair of New Hampshire for the Chinese mission will cause profound satisfaction in two hemispheres—in the Western because it gives us an assurance that the path of usefulness is not yet closed to him, as we feared it might be, and in the Eastern because there is no country in the world as ripe for reform just now, and as eager for reformers, as China. That he will be speedily taken out of our service for that of the Central Flowery Kingdom we have very little doubt. The Chinese have already employed foreigners in nearly every department of their administration except education, and they will almost certainly seize on Mr. Blair for the superintendence of their elaborate system of competitive examination for college degrees and Government offices. His fame as an educational reformer has already penetrated the Board of Foreign Affairs, and will have penetrated the Board of the Vermilion Pencil and of the Blue Sealing-Wax before he reaches Hong Kong. President Harrison, indeed, might as well be now looking around for his successor. There is only one thing that can prevent his success in his new sphere, and that is the hostility of the Jesuits. That powerful order is probably more powerful to day in China than in any other country. Many of its agents are Mandarins of high rank, disguised, of course, as Buddhists. They know Mr. Blair well, through his attacks on them in the debates on his Education Bill and his exposure of their doings in American newspaper offices. That they will try to poison the minds of the Empress Mother and the young Emperor against him is what may reasonably be expected; but Mr. Blair's arrival in person will make short work of their intrigues.

The Connecticut fugitive from justice for

whose requisition Gov. Hill declined to recognize Gov. Bulkeley's request, has been set free in this city. Another fugitive, the horse thief now in jail at Carmel, N. Y., is hoping to regain his liberty in the same way soon. It is said that Gov. Bulkeley will send a requisition for him to Gov. Hill, and the latter declines to say what he will do about it in case it arrives. He evidently has some doubt about both the legal and political wisdom of his first refusal, or he would not hesitate about following it with a second. His remarkable conduct has made him more enemies than friends among the Connecticut Democrats, for all the respectable portions of the party there, as well as the leading Democratic newspapers, condemn him as being entirely without justification in law. Even so devoted a supporter of the Governor in this State as the Brooklyn *Eagle* has felt obliged to rebuke him for his course, saying that Gov. Bulkeley, under the Constitution of Connecticut, "is required to continue" the discharge of the duties of the office until his successor has been duly qualified; that as Governor *de facto* he is "entitled to all the respect due to a Governor both *de jure* and *de facto*"; that the "legal aspects of the case are not affected in the slightest degree by the quarrel of contentious politicians"; that Gov. Hill's refusal "was obviously based upon a misconception" of Gov. Bulkeley's legal status, and that Bulkeley's requisition "was entitled to receive as much credit as would be given to a similar request preferred by the Governor of any other State."

The bitter war which is raging among the Republicans of New Hampshire is casting much light upon political methods in that State, and especially upon the character of "Bill" Chandler, so long the boss of the Republican party. It has always been believed that the Chandler ring have used their influence over the Federal courts as a club for Democratic heads, and one specific instance of the sort is given by Herman W. Greene, member of the Legislature and now, as for some years past, a prominent member of the Republican party. Nearly thirty years ago Mr. Greene made oath that he was a resident of Boston, and therefore not subject to the draft in Hopkinton, N. H., where he had formerly lived. In the year after taking this oath, having meanwhile returned to Hopkinton, where he has lived ever since, he was elected moderator of the town meeting. Upon these facts Chandler had him indicted for perjury in the United States Court, saying, to quote from Mr. Greene's speech, that "he could indict me for a crime that would make me cease to be a Democrat and be a cowardly cur of a Republican," and having the complaint "signed and sworn by a military tramp that happened to be at that time within the limits of this State, and who left before it came to light and before I was arrested." Mr. Greene's interesting narrative proceeds as follows:

"But I heard some information of it, and I called upon Mr. William E. Chandler and he frankly told me that he knew nothing of such a matter whatever, and that he would not in that instance make a complaint for a crime against me. He had it in his pocket signed then, and had me arrested when the complainant was in Virginia, and he knew there was no law in New Hampshire under which he could make that complaint as a lawyer and a man, and no facts upon which to support it. Four times between the making of that complaint and my discharge in the United States Court, Chandler said to me this: 'Mr. Greene, if you will abandon your Democracy and come to the rescue of the Republican party in your town, this prosecution shall be withdrawn.' Respecting myself, resenting the insult, I replied to him in the plainest language."

A bill has been introduced in the Kansas Legislature to prohibit the making of contracts payable in gold. There is not much probability that such a bill will pass, or that it will have any other effect than to drive capital out of the State, and make the condition of borrowers considerably worse than it is. But the introduction of such a bill raises the question of the competency of legislation to prohibit the making of contracts, not immoral *per se*, by private individuals. If a contract may not be made in terms of gold, may the Legislature also prohibit contracts in which parties agree to deliver wheat, iron, or brick, or to convey real estate, or to perform labor? In times like these, when the idea is rife that one kind of money is as good as another, and better, too, and that the quantities of goods that money is exchanged for are not to be taken into the account at all, all sorts of rattle-brained projects will be put on foot, to the detriment mainly of the projectors. One thing is certain, and that is that Kansas will be a good State for capitalists to avoid if she puts herself in the attitude either of annulling contracts already made, or of prohibiting the making of such as the civilized world considers innocent and lawful.

We have received from Mr. Frederick Wm. Luttgen of this city a plan, or device, for a "supplementary silver coinage." The plan has been copyrighted, but the writer authorizes us to publish it, and asks us to give our opinion of it. He begins by showing that it is impossible for one nation or even for an international conference to maintain a fixed ratio of 1 to 16 between silver and gold, or any other ratio. "This is no more in their power," says Mr. Luttgen, "than it is in their power to regulate the weather." Here we agree with Mr. Luttgen perfectly, and we congratulate him on the felicity of his expression. Nevertheless, he thinks that something ought to be done for silver. So he proposes that the coinage ratio be changed whenever necessary so as to correspond with the market ratio of the preceding twelve months. If, for example, the market ratio for the past twelve months has been 1 to 19, let the coinage ratio for the next year be 1 to 19. Then the Government should purchase 200,000 ounces of silver bullion daily, and in case the market price of silver continues to fall, the purchases should be increased in a proportionate sum. There are several other devices auxiliary to this one, which we need not enumerate, because our criticism goes to the root of the whole scheme and of all other schemes having a similar purpose. We are opposed to any and all projects which have it for their aim to do something for silver, or for lead, or for tin, or for Babbitt metal, or for tea, or for coffee, or for newspapers.

Local Assembly 1562, Knights of Labor of the city of Brooklyn, have "tumbled to" the merits of the silver legislation now in force, and have petitioned Congress to take into consideration in like manner their claims as producers of useful articles by buying at the market price a sufficient amount of shoes, for example, "for a year's supply," and issuing certificates thereon redeemable in gold, silver, greenbacks, or shoes. If an emergency arises, such as a shortage of revenue, the certificates may be redeemed in shoes only at the market price. Of course this arrangement for supplying currency to the people would not be limited to the shoe trade. Money might be "based" on hats, on carpenter work, on plumbing, or on machinery. Indeed, the more fixed and permanent the property, the more secure would the currency be. In view of the success which has attended the experiment of buying silver and steadying the price of that commodity, the plan of Local Assembly 1562 is certainly worth a trial. We trust that the K. of L. in other parts of the country will push it vigorously.

The Philadelphia *Press* asks us whether the prices of carpets have advanced or not since the passage of the McKinley Bill, and intimates pretty strongly its belief that they have not. We have made some inquiries on the subject, and have received answers from competent authorities to this effect: Manufacturers of carpets have advanced their prices 10 per cent. This advance was announced by circular some weeks ago, and the circulars have not been withdrawn or modified. The advance was made necessary by the increased duties on carpet wool. Retailers' prices have advanced in some places and in others not. They have advanced on some kinds and on others not. There is a considerable stock of the old make still on hand, and these are still sold at the old rates. As a general rule, consumers have refused to pay advanced rates for carpets. Whether an advance corresponding to the manufacturers' advance, or any advance at all, can be obtained by retailers after the old stock is entirely gone, is not yet known. This is the sum and substance of the best opinion we have been able to get. It is within our knowledge that in New York the leading retailers have advanced the price of ingrain carpets ten cents per yard. If, after all, the price is no higher than before, the futility and uselessness of the McKinley Bill as to this particular matter is evident. The retailer has lost his profit and nobody has gained it, not even the domestic wool-producer, because he does not produce this kind of wool at all. American industry is not

usually "protected" by putting a new burden on the manufacturer unless somebody else gets a benefit from it.

The effort which has been made unsuccessfully in Massachusetts at the two preceding sessions of the Legislature to pass a corrupt-practices act, will be renewed at this year's session. The measure of former years has been revised and made more stringent. It provides that every committee or organization which receives and spends money to promote the nomination, election, or defeat of any candidate for State, county, city, or town office shall have a treasurer, through whom all expenditures shall be made, and that all such treasurers, all candidates for nomination or election, and all persons expending for such purposes more than $25, shall file with the Secretary of the Commonwealth, or, in case of municipal elections, with the city or town clerk, a detailed statement under oath of the aggregate of all sums received and of all the expenses and disbursements. The bill also prescribes the form of the account, and requires State officials to supply printed forms to committee treasurers, candidates, and others applying for them. Instead of penalties for failure to comply with the requirements of the law, authority is given to the courts to compel delinquents by proceedings in equity to file the specified statements. This is a different measure in many respects from either our New York law or any pending bill in other States, but it is evidently the result of careful and intelligent study of the problem which it seeks to solve, and seems well calculated to make the undue and improper use of money in elections, without detection, extremely difficult, if not impossible.

The proposed appointment of a commission to sit on the "Labor Question" is undoubtedly one of the little bits of preparation the English Tories are making for the general election. They want to come before the country, at the dissolution of Parliament, as the poor man's friend *par excellence*, without saying exactly what they are going to do for the poor man. Commissions of inquiry of this sort in England are very slow-moving bodies. They sit a long time, adjourn very frequently, hear clouds of witnesses, and draft their reports in a most leisurely manner, so that it is safe to say that the report of this commission would not be ready before the general election; but the mere sitting and taking testimony would spread abroad the belief, or would be meant to do so, that the Ministry had some grand scheme in mind for the improvement of the condition of the working-classes. There is no likelihood that they have any plan whatever for dealing with the present hostility in England between labor and capital, and the chances are that their commission will aggravate it. A great deal of the present strife is due to unreasonable expectations excited by the encouragement given two years ago to the strike of the dockers. It was taken as a confession on the part of the middle and upper classes that there was something terribly wrong in the conduct of employers which legislation could promptly cure. Ever since then the Dock Companies have not had a quiet day, and unskilled labor all over the country has been thrown into wild disorder.

The French Chambers have voted $100,000 for the concession of the excavation at Delphi which our Archæological Institute thought it had secured, and have got the prize. There was hardly any opposition to the vote, first, because it is part of an arrangement for a commercial treaty, and, secondly, because it puts France on an equality with Germany in the field of archæological exploration. Germany has got much glory out of Olympia, so France must have a chance to get glory out of Delphi. As the "finds" made by the explorers cannot, we believe, be taken out of the country, nothing but the credit of adding to our knowledge of the history and arts of ancient Greece is to be had from the concession. The readiness of private individuals in America, through the Archæological Institute, to make up the amount, was used by the French Minister as an example in asking for the appropriation. The willingness of private persons in this country to do such things probably surprises Frenchmen as much as the readiness of the Government to do them in European countries surprises some of us. It would probably be impossible to explain intelligibly to some of our Congressmen — Senator Plumb of Kansas, for instance — the attitude of the French Government towards art and literature, or justify to him a vote of public money for the purchase of pictures or the sending of young men to Rome to study art. But the Greek side of this Delphi transaction would be made comprehensible to him by showing that the admission of dried currants to the French markets at lower rates of duty was part of the consideration. "Ah! now," he would say, "you begin to talk sense."

As the detailed returns from the Spanish elections come to hand, the triumph of the Conservatives appears to be even more sweeping than the telegraphic despatches indicated. The new Cortes will be composed of 265 supporters of the Administration, as against only 68 followers of Sagasta, 27 Republicans, and 23 of all other factions. Even in the cities, notably Barcelona and Madrid, which were supposed to be Liberal strongholds, the Government candidates polled a surprising vote. But two Liberal candidates pulled through in Madrid, while six Conservatives were elected. The Republicans are delighted at the good showing they made in the voting. In Madrid, for example, they polled 17,247 votes to about 35,000 for all shades of monarchical candidates. One-third of the total vote in the very capital of the kingdom cast against the monarchy is certainly a significant, perhaps an ominous result of the new law of universal suffrage. At the same time, it is a curious fact that there never has been a Cortes in which so many titled Deputies sat as will be present in the body just chosen. Still, this may not mean the predominance of the aristocracy in the lower house, as many of the counts and marquises elected to it made their canvass on the basis of a hearty acceptance of the people's right of representation, and presented the novel spectacle of nobles of Castile going hat in hand to ask the votes of peasants and laboring men. The cabled reports of Republican rioting in Barcelona appear to have been exaggerated; Salmerón was fairly defeated—at least, the Election Board, containing a majority of his sympathizers, so declared. Castelar himself narrowly escaped defeat.

From German criticisms on the recent Government Commission appointed by Emperor William to deliberate upon a reform of the Prussian schools, it would appear that the high expectations with which the calling together of this body was welcomed have by no means been fulfilled. From the very beginning the transactions of the conference were handicapped by the high-handed manner in which the Emperor forced his own views and propositions upon the assembly, entirely disregarding the official programme laid out by the Minister of Public Instruction. One of the most important subjects before the conference was the question of the future relation between the Gymnasium and the Realschule—the question whether the latter should be lifted up to the standard of the former; whether its scope should be widened so as to embrace both ancient and modern literatures and the sciences; whether the social status of its graduates should be raised so as to give them access to the universities; whether, in short, the high school of the future should be a reorganized Realgymnasium. But the debate on this point was cut short by the Emperor's statement that he should like to see all existing Realgymnasia abolished, and that in future he should veto the establishment of a single new one. And the same autocratic tone he maintained towards almost every question brought up in the conference. The result is, that the commission has been discharged without having accomplished a single reform of any consequence, except, perhaps, the abolition of Latin composition in the Gymnasia. Meanwhile, a new commission has been appointed, with Dr. Hintzpeter, the intellectual adviser of the Emperor, as Chairman, to draw up a detailed scheme for a new high-school curriculum; and undoubtedly the imperial views will find an adequate expression in the resolutions of this committee. What the effect of the Emperor's attitude in this whole matter upon the public mind has been, may be judged from a witticism now current in Berlin. Query: "Was ist der Unterschied zwischen dem lieben Gott und Kaiser Wilhelm?" Answer: "Der liebe Gott weiss Alles, Kaiser Wilhelm weiss Alles besser."

THE CHILIAN CONFLICT.

THE contest now raging in Chili between President Balmaceda and Congress is a very interesting study in government for foreign observers, however disastrous it may be for the Chilians themselves. It has brought to the arbitrament of the sword questions which have within the present century made great disturbance in nearly every parliamentary country. There is in it a bit of French, of German, of Danish, and even of American history, but it is Denmark which supplies the situation most closely resembling that which exists to-day in Chili. Here in the United States, and in England, it seems now to be a settled maxim of party government, accepted by all parties, that no matter what differences may prevail between the Executive and the Legislature, the appropriations necessary to keep the existing machinery of administration in motion shall always be made—that is, that expenses of the army, navy, and civil service for one year at least shall be voted. But this rule has not been fully accepted in other parliamentary States. During the earlier years of Bismarck's career, when he was fighting the Prussian Parliament, they refused him his supplies, and he levied them by royal authority. In Denmark for many years the Radical majority in the Chamber has regularly refused to vote any money whatever for the maintenance of the Government, and the Ministry has just as regularly levied by royal ordinance as much money as it needed. In France a modification of this kind of demonstration has long prevailed—consisting in making the appropriations in twelfths (*douzièmes*)—that is, giving the Ministry enough money for one month, and reserving the rest for further consideration, in order not to bring the wheels of administration to a full stop. In all these cases, the object is the same—the expulsion from office of an obnoxious Cabinet.

The temptation to resort to this mode of ejectment is very strong in every country in which the existence of the Ministry is dependent on the will of the parliamentary majority and the traditions of parliamentary government are not very deeply rooted. One can hardly conceive of it as possible in England, but the French came near it under both MacMahon and Grévy. The kind of situation which calls it forth was to be witnessed in this country in Andrew Johnson's day, and closely resembled that which exists to-day in Chili. If the majority in Congress, strongly disapproving as it did of his "policy," had refused to make any appropriations whatever until he either resigned himself or appointed a Cabinet selected by the majority, they would have done almost exactly what the Chilian Congress are now doing. The expenses of the Chilian civil and military service are already settled by law as ours are, but they need, as ours do, an annual vote of Congress to provide the money for them. This the present Congress has refused to make, as a means of coercing the President into abandoning the practice of influencing the nomination—or "naming his successor," as we should call it—now of long standing in Chili, and into appointing a Cabinet agreeable to the majority. The Government of Chili is, in truth, very much in that family stage in which ours was down to the election of Andrew Jackson. That is, it is in the hands of a small body of highly respectable gentlemen of good family, who expect to divide the offices among themselves and nominate their successors, as the American Congress used to do, and expect their recommendations to be accepted as directions by the voters. In trying to "name his successor," President Balmaceda is only doing what others have done before him, and which might be done with impunity if he had a majority in Congress on his side. But this, owing to causes too numerous to describe here, he has not. The majority are bitterly opposed to him.

An attempt at reconciliation which was made last year broke down in October by the resignation of a compromise Cabinet, and he then adjourned, as he has the Constitutional right to do, the extra session which he had called. When Congress is not in session, it is represented by a permanent Commission composed of its own members, which acts as a sort of Supervisory Board towards the Executive. This Commission kept up the hostility to him, and ended by proposing to call a convention of all members of both houses to take part in its deliberations, or, in other words, an extra-constitutional body, and opened a regular campaign against the President throughout the country, very much like that which the Republicans carried on against Andrew Johnson in 1866. The Commission then, in December, called on him to convene Congress to discuss the budget, but he replied that the reasons which satisfied him that it was proper to adjourn Congress in October, prevented his calling it together again in December. He took the ground which he maintains in the manifesto which has just reached us, that he represents the Chilian people more clearly and authoritatively than the majority in Congress; that his motives are purer and his wisdom greater; and that he is now the sole defender of the Constitution against malignant enemies. In fact, he almost exactly occupies the position occupied by President MacMahon as against the French Republicans in 1877. On this issue the Congressional majority have taken up arms.

It may seem very extraordinary that, as the Congressional elections take place this month and the Presidential election in June, both parties should not be willing to wait and let the voters, as the French did in 1877, decide between them. But this suggestion touches at once the weakness of the Chilian Constitution. Chili is not a democratic republic like France or the United States. It is, as Rome or Venice was, an aristocratic or oligarchical republic. The government is carried on by an upper class, whose decisions are registered by voters with a property qualification. There is, therefore, no tribunal outside the political class, as there is in France, or England, or the United States, to which an appeal can be made when this class is hopelessly divided. When Pompey and Cæsar cannot agree in Chili, therefore, they have to fight now as they had to fight 2,000 years ago in Italy.

A GREAT REVELATION.

NOTHING in recent political history is more interesting than the gradual transfer westward of the operations of the Cobden Club. Twenty years ago, its worst work was done almost exclusively in the States along the eastern seaboard. At that time it spent most of its corruption fund in New York, in the payment of free-trade editors and orators and the diffusion of pernicious books and pamphlets, although no inconsiderable sum found its way to Boston for the same fell purpose. Its seductions, too, at that time were rendered all the more powerful by its practice of paying in gold when we were living under the régime of irredeemable paper. People who never saw or handled any kind of money but dirty greenbacks or national-bank bills were naturally dazzled by the display of "British gold" which the Club was always careful to display before the eyes of faltering or unprincipled protectionist orators and writers. Many a man, doubtless, who at that period would never have succumbed to paper money, was easily overcome by one peep into the small canvas bags from which the agents of the Club paid American traitors the price of their iniquity.

Since the resumption of specie payments, we have every year heard less and less of the work of the Club in these regions. The *Tribune* and the Philadelphia *Press* and all the other high-tariff organs ceased, little by little, to speak of it in explanation of the activity of the free-traders, and confined themselves simply to quotations from British journals showing the devilish satisfaction experienced in England at any signs, however delusive, of a better market in the United States for British goods. These extracts brought out finely the demoniacal desire of British manufacturers to furnish the American people with cheap clothing, but they did not answer the question, What was the Cobden Club doing with its enormous annual revenue? Where was the gold going which the members of the Free-Trade League, the venerable William Cullen Bryant, and other free-trade editors at one time pocketed so freely?

The answer to these questions, as we now know, is and was that the exposures made in the East had proved too much for the agents of the Club. They had been followed up more closely than they could bear. One of their conversations, overheard in a cheap restaurant by a correspondent of the *Tribune*, was of itself sufficient to make New York and the other seaboard cities too hot for them. They had to betake themselves to the West, in reliance on the simplicity of the agricultural mind, the greater distance from Europe, and the reputed greater venality of the Western editors and legislators. In fact, they were directed to go West by the authorities in London, on the assumption

that their money would go further there in the purchase of votes and influence, and that they would there be safer from detection. Mongredien's brochure attempting to show American farmers that they were out of pocket by the tariff, revealed clearly the quarter to which the Club was then directing its labors.

We are glad to say that its agents have at last been caught also in the new field, and there is a fair prospect that before Congress meets again there will be no corner of this vast continent in which one of them can carry on his nefarious game without being discovered and dragged to light. To the *Iowa State Register*, a paper edited by a leading Republican statesman, Mr. Clarkson, the late Assistant Postmaster-General, belongs the honor of having at last succeeded in bringing home to the Western public the exact nature and extent of the corrupting and impoverishing influence exerted by the Club. In what is, in our opinion, the boldest article we have ever seen in a newspaper—we say "boldest" having in our minds the unscrupulousness of the men who serve the Club "in our midst"—he brings to light facts which promise to destroy the Club's powers of mischief everywhere. The more important portions of it we extract entire :

EXPOSING COBDEN CLUB INFAMY.

The British Cobden Club, which has so brazenly attempted to control the business policies of the world in the interest of England's trade, by the corrupt use of fabulous sums of money, is now threatened with complete exposure through publication of the Club's secret accounts! Strangely, too, the exposure is said to be the result of the methodical methods of Prince Bismarck, who obtained a copy of the Cobden Club's secret accounts through the connivance of the German Embassy in London. This startling news does not originate with the *Register*, but we find it in a special despatch to the St. Louis *Republic*, the leading Democratic paper of the Mississippi Valley, as follows:

"LONDON, February 9.—A curious libel case has just been before the law courts in Sweden. It appears that a Swedish newspaper named *Motalaposten* accused certain persons of high social position, one of these being the late General Director of Customs and another the present Lord Lieutenant of the county of Stockholm, with having received subsidies from the Cobden Club amounting to £120,000 for carrying on a free-trade agitation in their country. The Court dismissed the libel, the writer pleading that all the statements were true, claiming that Prince Bismarck had been able, through the German Embassy in London, to obtain a copy of the Club's secret accounts, and these accounts fully bore out the statements that had been made. The writer of the article received his information in such a way that there could be no question about its authenticity, and he further alleged that these secret accounts would be very soon published in Berlin."

The reader will bear in mind this is not the evidence of a Republican paper. It was sent as a special from London, England, to one of the principal Democratic papers of the United States! The evidence was sufficiently strong for the Swedish court to dismiss the libel suit against a newspaper that had made the charge that the General Director of Customs and Lord Lieutenant, high officials in Sweden, had "received subsidies from the Cobden Club amounting to £120,000 forcarrying on a free-trade agitation in their country"! The despatch strongly adds that "thewriter of the article received his information in such a way that there could be no question about its authenticity"! That evidenc was enough to convince the Swedish court, and it should be sufficient to convince the people of all the world, that the Cobden Club is spending many millions of dollars every year to control the markets of the earth in he interest of the manufacturers of Great Britain, who contribute the Cobden Club funds to accomplish that very purpose.

The concluding portion of Mr. Clarkson's brave but painful revelations will be read with mingled sorrow and indignation by every lover of his country, and indeed by every good man and woman. From this it appears that the Cobden Club expended $5,000,000 (five millions) in buying votes at the last election, and of this $500,000 in Iowa alone. This is very bad, but it is something with which, on a smaller scale, we are unhappily more or less familiar. What will shock people most is the news that the *Leader* of that State was receiving a subvention of thousands of dollars from the Club four months before the election; that the Chicago *Tribune* also has been long kept alive by a monthly subsidy from the same source, supplemented, however—to tell the entire truth—by another subsidy from "The Brewers' and Distillers' Trust." Who of us here at the East had any idea that the Chicago *Tribune* had been one of the first and most costly victims of the Club's seductions?

The impending production of the Club's "secret accounts," however, relieves us from the necessity of further comment at present on these disclosures. The dismissal by the Swedish court of the libel suit against the *Motalaposten*, on the promise of the editor to publish these accounts in Berlin with the kind assistance of Prince Bismarck and the German Embassy in London, is the handwriting on the wall for the free-traders all over the world. The Cobden Club has gone on for years publishing annual statements showing that its income was only about $5,000 per annum. It now appears that the secret books showed receipts amounting to many millions—say $10,000,000. There is little difficulty in detecting in these remarkable exposures the hand of some of the lawyers who wrest unclaimed English estates for American heirs from the rapacious maw of the Queen and the Lord Chancellor; but Mr. Clarkson is none the less entitled to the credit of being the first to lay the infamy really bare.

GOV. ABBETT'S SCHEME OF TAXATION.

IT seems to be thought by most people that they ought to enjoy the blessings of good government, as they enjoy those of the sunlight, without any great exertion on their part. Whether they ought to do so or not, all history teaches that as a matter of fact men do not long enjoy these blessings upon such terms, and the pleasant dream is invariably followed by a rude awakening. The people of New Jersey are now passing through an experience of this kind. A large proportion of the most intelligent citizens of that State have concerned themselves very little with what goes on at Trenton, and they now find that their Governor, whose policy and methods closely resemble those of Gov. Hill of New York, has brought before a subservient Legislature a scheme of taxation of the most revolutionary character. What he expects to gain by it we do not know, but what he should gain by it is a permanent opportunity to devote himself to his private affairs.

The bill reported by the Commission on Taxation is too long to be here considered in detail. It is full of obscurities and of objectionable features which can be appreciated only by lawyers, but its principal innovations are of a nature to be understood by every one, and should be known by all persons who contemplate making New Jersey their residence. The leading administrative feature is the establishment of a supreme board of inquisitors with arbitrary powers, who can revise and alter at their discretion the assessments and other proceedings of local officers and boards. For the exercise of functions that would be a strain upon the wisdom of Minos, the members of this Board are to be paid $2,500 a year; but their patronage in the employment of assistants and attorneys is limited only by the approval of the Governor. We cannot determine from the bill whether any appeal to the courts is allowed from the decisions of this Board. Apparently the only remedy is the dubious one of a certiorari proceeding, but it is not clear that the acts of the Board can be reviewed in this way. It is not often that any officers under a free government are given such arbitrary powers as are here provided. As an illustration of what they can do, it is enough to point out that they are empowered to compel all the adult residents of the State owning personal property worth over two hundred dollars to make sworn answers in writing to *any* questions prescribed by the Board, under penalty in every case of one thousand dollars.

The most revolutionary changes, however, relate to the assessment of personal estate, which is defined to be "everything which is subject to ownership not included in the term 'real estate.'" No deduction is to be made from any valuation of either real or personal estate except for debts of record in the State. Strictly speaking, this would seem to apply only to judgments, as the bond in case of mortgage indebtedness is not usually recorded. If this strict construction is not the true one, real estate mortgaged to non-residents would pay taxes only on the equity of redemption—a result which we can scarcely believe even the framers of this bill to have intended, as in a short time the amount of exempt real estate would enormously increase. As to the manner of assessment, it is necessary to quote the language of the bill:

"On the first Monday in April in each year, or as soon thereafter as practicable, and before the first Monday of June, the assessor or other taxing officer shall call upon each person within his taxing district, and furnish him or her with proper blanks, to be furnished or prescribed by the State Board of Taxation for the purpose; but if it be known to the assessor or taxing officer that *such person* is under the age of twenty one years or is non compos mentis, then he shall make such service upon the guardian, trustee, or other representative of *such person* under the age of twenty-one years or non compos mentis; and thereupon *such person* shall make to such assessor or other taxing officer a full, correct, detailed, and itemized description of all the personal estate of which *such person* was the owner on the first Monday of April of the current year; *such person* shall also, at the same time, make a full and true statement in like manner, in writing, distinctly setting forth a full, correct, detailed, and itemized description of all the personal estate held, possessed, or controlled by him as executor, administrator, guardian, trustee, receiver, partner, agent, attorney, president, or accounting officer of a corporation, consignee, bailee, or in any representative or fiduciary capacity; and he

shall fix what he de ms the true value thereof to each item of personal estate, whether the same be owned by him personally or held by him in a representative or fiduciary capacity, for the guidance of the assessor or other taxing officer, who shall determine and settle the true value of each item after an examination of such statement, and also an examination under oath of the party, if he deem it necessary, or he may adopt the valuation of the party."

The italicized words are an example of the ambiguities of the bill. It is further provided that every resident as aforesaid must make oath as to all property held by him in a representative or fiduciary capacity, and also as to any attempts made by him to evade taxation of his personal estate. The place of record of all debts of record in the State must also be stated, and all personal estate held in either an individual or representative capacity claimed to be not taxable must be included in the list. Every adult male is subject to a poll-tax not exceeding one dollar.

It has been supposed that there were certain advantages in organizing corporations under the New Jersey law, and the Sugar Trust was reorganized as a New Jersey corporation. The predicament in which such corporations may find themselves next April appears from the following provisions. The personal estate of every corporation organized under the laws of New Jersey shall be taxed where the principal office of the corporation is situated, and the personal estate of all other corporations doing business in the State shall be taxed where it is found. Taxes assessed upon shares of stock or registered bonds of any New Jersey corporation shall be first liens upon such stock or bonds. The bill, it should be noted, does not apply to railroads and canals. There is a general provision at the beginning of the bill "that all real and personal estate *within this State*, whether owned by individuals or corporations, shall be taxed at the true value thereof," etc., and it might be supposed that this would exempt personal property the situs of which was without the State. But the other provisions of the bill are inconsistent with this view, and it seems to be intended that such property, if owned by a resident of New Jersey or a corporation formed under the New Jersey law, shall be taxed in New Jersey.

The entire stock in trade, therefore, of all such corporations, as well as of individuals doing business outside of the State, their merchandise, bills receivable, book accounts, money, good will, and the contents of their safe-deposit vaults, must be reported in detail to the assessors of New Jersey, and pay taxes in that State. A commission merchant residing in that State and doing business in New York, must pay taxes upon everything that is consigned to him as well as upon his own capital, including all debts due him, without any deduction for what he owes except to the extent that he is a judgment debtor in New Jersey. It is obvious that this would mean ruin to many such dealers. If an institution, firm, or individual has on its hands as its own or for collection on the first Monday of April checks or notes to the amount of a million dollars, while its or his like obligations to the same amount are in the hands of another person, both parties are to be taxed, each upon a million dollars, although upon a settlement of accounts the whole of these obligations would be wiped out, and the total wealth of both parties might very probably not exceed a half a million—upon which they would also pay taxes. A wholesale dealer buys a bill of goods of an importer and gives his note for the price. Both are taxed, each for the full value of the goods. The wholesale dealer sells the same goods to a jobber, who gives his note for the price. Both are taxed. The jobber sells to the retailer on the same terms, and again both are taxed. These transactions might very well take place within the usual period of credit, with the result that the retailer would be taxed on the goods and the other three would be taxed upon the notes, and if the notes were put in the hands of their attorneys, the attorneys would be taxed for them, too. It would be as well to tax all sales of property and have done with it.

As we have seen, New Jersey corporations would have to pay taxes in that State upon their stock, wherever situated, except what was invested in land without the State, while resident stockholders would also pay upon their shares of stock, and under the laws of some other States stockholders outside of New Jersey would also be taxed on their shares. This would be a serious blow to these concerns, but the mischief would spread wider than this. The stock certificates of these corporations would cease to be negotiable, for no one could tell, without having a tax search made, that a certificate bought by him was not subject to the lien of taxes unpaid by some New Jersey holder.

It would be foolish, in the present state of public opinion, to expect sympathy for the owners of corporate property assailed by demagogues, but widows and orphans may obtain more commiseration. No executor, administrator, or trustee, if this bill becomes law, can without perjury fail to report for taxation all the property of those whom he represents, no matter though they and their personalty have never been in New Jersey. Such property consists to a large extent of securities bearing interest at a rate determined by the fact that they are usually untaxed. The common sense of property-owners revolts at the idea of double taxation; and when real estate is taxed without any deduction for mortgages upon it, it is so palpably unjust to tax the mortgages as well that the whole community has long acquiesced in the disregard of the letter of the statute. The proposed act would have consequences that cannot be accurately predicted. Lenders of money would insist that borrowers should pay the increased tax, but if the act were generally evaded, the income of trust funds that must be invested within the State might be seriously impaired.

That evasion would be general goes without saying. The proverb, "Ask me no questions and I'll tell you no lies," is always in point in such attempts as this. Rightly or wrongly, men simply will not, even if they could, make out lists containing every item of property, tangible or intangible, which they possess, and turn them over to tax-gatherers. Conscientious people will be distressed by their position, but self-preservation is the supreme law even with them, while unscrupulous persons will of course return nothing the ownership of which they can conceal. To make the bill symmetrical, every one should be required to swear to the truth of his return of his own property as well as of that which he holds for others. There would at least be systematic injustice in that, while the present scheme would principally affect certain defenceless classes. It might properly be labelled "An Act for the confiscation of property belonging to widows, orphans, and helpless persons, and to corporations, and to cause truthful persons to remove from the State." It would put a premium upon falsehood, and, as the report of the Connecticut Commission conclusively showed, the premium would be effective.

"This act shall take effect immediately." Unless the citizens of New Jersey bestir themselves, they will find that they are saddled with a most vexatious, unnecessary, and injurious law, to comply with the provisions of which will occupy a large part of their time this spring. Farmers must stop their work to make lists of their tools and animals, business men must go through all their books and stock in trade, women must abandon their spring cleaning to make "full, correct, detailed, and itemized" lists of all their furniture, dresses, jewelry, books, and household goods, with their values—in short, the entire possessions of the inhabitants of the State must be written down and assessed in the space of two months. It may be trusted that the intelligent members of the community will see to it that legislators who vote for this measure shall not be returned at the next election—a much better plan than to abandon their residence in the State, a step which many of the well-to-do class are now making up their minds to take.

RECOLLECTIONS OF SHERMAN AND PORTER.

FEBRUARY 22, 1891.

THE air is full of Sherman and Porter and their great deeds, and I cannot, if I would, help turning back to some reminiscences of them both.

The first time I remember seeing Gen. Sherman near at hand was at the grand review at Washington in May, 1865, when, dismounting from his horse at the grand stand, as his army marched by, he ascended the steps to meet the President and Cabinet. My seat was close by, so that I could almost touch him as he passed up, and I can never forget his firm, vigorous step, still less the nervous quivering of his lip and the bristling up of his tawny moustache as he met Secretary Stanton, who had treated him so roughly about Johnston's capitulation. He drew back as Stanton stood ready to extend his hand, and, bowing slightly, took his seat. It reminded me of a tiger-cat or lion meeting an enemy and ready to spring at his throat. There is no question that Sherman, though a generous enemy, was a good hater.

The next occasion which brings him to mind is my return from Florida in 1870, when I met an ante-bellum acquaintance, Col. Archie Cole. He had been on Lieut.-Gen. Joe John-

ston's staff, and told me, in grandiloquent language, of the plans they had concocted for trapping and destroying Sherman at Atlanta, which he said would have changed the whole result of the war. These plans, he boasted, were only disturbed by Jefferson Davis's appointment of Hood in the place of Johnston. I heard the story without much accepting it, but did accept Col. Cole's invitation to meet Gen. Joe Johnston at his rooms at a Savannah hotel, where, accordingly, I encountered the great rebel, and got from him a pretty strong confirmation of the idea, then prevailing among Gen. McClellan's friends, that he (McClellan), having the ironclad *Merrimac* on his flank at Norfolk, was fully justified by military axioms in going to Yorktown instead of taking the James River base before the wonderful *Monitor* met and repulsed the Confederate ram.

I did not ask Johnston about his proposed capture of Sherman, but on my way North met and sat by the latter at Wm. H. Aspinwall's dinner party in New York, given to Gen. Sherman two or three days after I had seen Johnston and his staff officer at Savannah. Among others, there was present a rebel from Richmond, perhaps a Major-General, who was then making iron at the Tredegar Works. In a pause in the conversation I said to Gen. Sherman: "I have just been South, where I saw your old opponent, Joe Johnston, and had a talk with him and one of his staff officers; the latter thought you were in a very tight place at Atlanta, and that Johnston's removal changed the whole history of the war. I suppose when Gen. Johnston was removed by Jeff Davis, you must have been mighty glad to see him replaced by an inferior, madcap soldier like Hood? How was it?" "Well," said the General, with his usual frankness, "of course I was glad to lose Johnston from my front, but it really made no great difference in the long run, and one day, when Johnston (who had been at West Point with me) and I were sitting under a shade tree in North Carolina waiting to hear whether his terms of capitulation were ratified by Grant, I said, 'Tell me, Joe, did it make any difference except a few days more or less in time and some bloodshed? We had beaten you then, and, with the pick of the Northern armies at my elbow, you could not long have stopped our march.' Johnston readily acceded to that," said Sherman, "and that was the simple truth and all there was to it."

Finding him ready, as usual, to speak out, notwithstanding his having the rebel Major-General sitting opposite, I said, "I saw too, General, what they call down there 'Sherman's monuments'—blackened chimneys and ruins—painting you as quite a monster of cruelty." The General's face grew grave, and he tersely said, the company all attention now, "I'll just tell you the only case when I hesitated to push discipline and punish my officers for wilful destruction. Of course marauders and camp-followers burned, robbed, and committed outrages we could not always reach, but the one other case was this. One day Col. —— of the ——th Ohio, was brought to headquarters under arrest for burning a plantation-house. On being questioned he said:

"'Well, General, I have no defence to make; shoot me, but hear my story first. [He was not a literary fellow, and did not put into Latin "Strike but hear."] Escaping from prison some time ago, I was caught by bloodhounds and d——d rebels, and brought to this plantation house; while I lay there, torn and bleeding, the owner came out and kicked and cursed me, and I swore if I lived I would pay him off. I have gone and done it, and am now ready for a file of men and muskets to square my accounts.'

"What," said Sherman, "could I do? I had to pass it by quietly, but that was the only case when I forgave such a breach of the orders only to burn buildings under certain exigencies of war." All this was said earnestly, but without exaggeration, and I shall not soon forget his face and the withering look he cast at our vis-à-vis rebel, who sat and took the medicine like a good enough fellow as he really was.

The last time I saw General Sherman was when Porter brought him in the *Tallapoosa* to Cape Cod and stood next to him at a deer hunt. The General was brimming over with the enjoyment of his holiday, and when at night the boys and girls sang his old war songs, I thought they would never get him back to the ship.

My first meeting with David D. Porter made a great impression on my mind. It made very evident the contrast between army and navy, which I have ever felt when comparing the two. It was in the early part of 1862 Washington city was like a camp. Orderlies' horses were tied to every gate-post or galloping through the street like mad; the War Department was full of the pomp and circumstance of war; sentinels and plumes were at every door and at every corner, and access to Secretary Cameron's headquarters was difficult except to those decorated with two or three stars. On the other hand, the Navy Department, where Secretary Gideon Welles presided, was quiet as a church on collection day; but my good friend Captain Fox, who then perhaps ranked as Lieutenant-Commander, was Assistant Secretary, and really ran the whole concern, except the Cabinet meetings and the politics, which that Ancient Mariner Gideon himself attended to very well. I was in full affiliation with the navy, and had the entrée to all its doors—indeed, to this day, some thirty years' distance, some of the old clerks and door-keepers open to me now when I call, as if I had a right to go and come anywhere there.

Leaving the noisy War Department one day, where I had transacted some business for Gov. Andrew with Secretary Cameron, I sauntered in to see Capt. Fox, who was quietly smoking his cigar, and, if I mistake not, sitting with his legs around the back of a chair, warming his back at the open fire. With him was a small, dark man, with little show of uniform or buttons, to whom I was introduced, he being then Capt. Porter. He had been on furlough, commanding merchant steamers, perhaps, on the Pacific side of Panama; but Fox, with an eye to vigor and efficiency, had called him back into the navy and put him at the head of the bomb-fleet, then bound south to cooperate with the army in taking New Orleans—a most important command. It was a strong contrast to get ten minutes with him and Fox outside of the bustle and show of the army, and hear that he was just taking his leave on this important and delicate service.

I said good-bye, and think that the next time I saw him was when he was drilling his fleet off Fortress Monroe, preparing to attack Fort Fisher. I was again with Fox, having brought Gen. Grant down from his headquarters below Richmond, he and Fox coming to plan the Fort Fisher enterprise, in which Gen. Butler's powder-boat played such a characteristic but useless part. Admiral Porter gave us breakfast on board the flag-ship, and then made the signal for a drill of the fleet, practising for Fort Fisher by a sham attack on Fortress Monroe. In an incredibly short time the boats were around the Admiral's flag-ship; then came the signal for attack on the fortress, and the men swarmed and waded ashore. All was done with the efficiency and dash which marked our navy throughout the rebellion.

The third and last time that I ever saw Admiral Porter, as it was also the last time I saw Gen. Sherman—by a strange coincidence that seems odd at this sad time—they came together to the Cape. Admiral Porter was then, as always, quiet and efficient, and showed but little change in manner from the time when I first saw him starting out on his famous expedition to New Orleans. Admiral Alden, who led the advance at New Orleans in the *Brooklyn*, when Farragut passed the forts, was also one of the party, as brave an officer as we had in the navy, though not so lucky as some. The three cannot fail to occupy a high place in our gallery of heroic Americans. To end with Sherman—

"Staunch to the last, though age had tamed his strength,
And fell disease had clutched his mortal frame,
His spirit stood unmoved, until at length
The welcome summons from his Maker came.

"His sword hangs rusting on the darkened wall,
His hand shall grasp its trusty hilt no more.
Obedient to the great Commander's call,
He has departed to the further shore."

THE LATEST PHASE OF THE IRISH SCHISM.

THE ENGLISH LIBERAL VIEW.

LONDON, February 14, 1891.

NEARLY three months have now passed since the verdict against Mr. Parnell in the English Divorce Court brought about that schism in the Irish party which has fixed the attention of our politicians during every day since, and now at last the failure of the efforts which have been made in the last six weeks to bring about Mr. Parnell's retirement seems to show that the rent cannot be mended. Your readers will remember that when Messrs. O'Brien and Dillon returned from the United States to France, they made vehement efforts to bring about a reconciliation, addressing themselves alternately to Mr. Parnell and to the Irish majority which had just deposed him in London and defeated him in the Kilkenny election. It was so obviously to Mr. Parnell's advantage to get these two influential leaders on his side if he could, that he jumped at the chance of negotiating, and so obviously the duty of the Irish majority to lose no fair chance of healing the split and getting rid of Mr. Parnell quietly, that they did not hesitate to join in the negotiations. No one, however, who has studied Mr. Parnell's character and analyzed his tactics after the struggle with his former followers began, could have seriously expected him to retire. He was evidently playing a game in which he might have something to gain, because he might hope to divide them and to win over the impressionable Mr. O'Brien, while he had nothing to lose, because he could at any moment declare that the terms proposed for his retirement were insufficient to protect the interests of Ireland.

This is what he has in fact done. He began by promising to abdicate, at least for the present (since he was cautious to keep free from permanent engagements), if assurances were obtained that the home-rule scheme contemplated by the Liberal party would be sufficiently large and complete. Mr. Gladstone, who, though sometimes hasty in moments of excitement, is very wary whenever he feels that the position is critical or delicate, absolutely refused to have any sort of communication with Parnell. When the leaders of the Irish majority approached with inquiries, he
